This raises lots of questions. While some will say that the small entrance/large exit on Kennedy's skull came as a result of the 6.5 mm bullet's breaking up, this small entrance/large exit anomaly was not, as near as can be determined, replicated in the tests performed at Edgewood Arsenal in 1964. While it is indeed a characteristic of soft-nosed hunting ammunition to enter a skull and break up while passing through the brain, these 1964 tests showed that bullets like those fired in Oswald's gun were not likely to break up in the brain. These tests showed that the bullets fired in Oswald's gun, moreover, were among the most stable ever tested. This means that the bullet striking Kennedy, should it have entered the skull intact, would most probably have not tumbled, and, if it did, would most probably have not fragmented. Dr. Olivier, who supervised the 1964 tests, told Howard Donahue that most of the bullets

he tested broke into only two or three large fragments. That's it.

So why did the bullet striking Kennedy, which would not explode inside the brain and could only have exploded upon impact with his skull, explode into far more pieces than the similar-sized bullets used in Olivier's tests?

And why was there no spatter from the back of JFK's head on frame 313?

Large Defect Analysis

For the answer to that question let's consult the doctor who first inspected Kennedy's large head wound, Dr. William Kemp Clark...

Just hours after the assassination, Dr. Clark told the nation at a press conference that the wound *"could have been a tangential wound, as it was simply a large, gaping loss of tissue."* And from there his resolve grew stronger. Over the next few weeks, in interview after interview, Dr. Clark repeated such claims and was considered so credible that as late as December 23, 1963, Medical Tribune and Medical News was still reporting that the fatal bullet struck *"a tangential blow that avulsed the calvarium and shredded brain tissue as the bullet left the skull on a glancing course."*

Dr. Clark was just not one to back down. Months after he'd been told the conclusions reached at autopsy, in fact, Dr. Clark told the Warren Commission that, in his impression, the large head wound was a--drum roll, please--*"tangential wound."* To his eternal credit, moreover, Dr. Clark also told the Warren Commission why he suspected as much. He testified that if a bullet *"strikes the skull at an*

angle, it must then penetrate much more bone than normal, therefore, it is likely to shed more energy, striking the brain a more powerful blow. Secondly, in striking the bone in this manner, it may cause pieces of the bone to be blown into the brain and thus act as secondary missiles. Finally, the bullet itself may be deformed and deflected so that it would go through or penetrate parts of the brain, not in the usual line it was proceeding." Dr. Clark had thereby testified that, in his opinion, the injury to Kennedy's brain was more extensive than would be expected if the bullet had simply entered low on the back of the head. As he only inspected the brain at the large defect, moreover, he had testified that, in his opinion, a bullet had transited the skull along the surface of this defect, i.e., that this defect did not appear to be the exit for a bullet entering elsewhere. He'd also voiced his suspicion that splinters of bone had been blown into the brain at this location.

That splintering along the skull's inner table is symptomatic of a tangential wound, moreover, has long been noted. The caption to a photograph taken at the Army Medical Museum after the Civil War, and found in a collection of civil war medical reports available from BACM research, relates *"The specimen is an excellent illustration of that variety of fracture of the skull, in which the outer table remains intact, and the thinner and more friable vitreous table is splintered: an accident resulting always, it is believed, either from a shock of a projectile striking the cranium very obliquely, or else from a comparatively slight blow from a body with a large plain surface."*

That small pieces of bone were, shockingly, when one thinks of it, blown into Kennedy's brain at the supposed exit location was confirmed, by the way, by the January, 1965 report on the assassination by Dr. Finck given to his superior, Gen. Blumberg. Finck described the inspection of the brain as follows: *"No metallic fragments are identified but there are numerous small bone fragments, between one and ten millimeters in greatest dimension, in the container where the brain was fixed."* This blowing of numerous small bone fragments, or splinters, into and onto the surface of the brain would have to have occurred at the large defect by Kennedy's temple, where small pieces of bone were never recovered. The two suspected entrances at the back of the head, after all, were barely the circumference of the bullet.

It seems entirely too much a coincidence then that all the large head wounds affiliated with 6.5 mm ammunition in the Fiji Campaign were tangential wounds, and that the first doctor to inspect the large head wound on Kennedy thought it was a tangential wound, and that numerous bone fragments were removed from the surface of Kennedy's brain, and that such fragments are symptomatic of, yessirree, tangential wounds.

It is also intriguing to know that Dr. Clark never really wavered from his suspicion that the wound was "tangential". While he testified to the Warren Commission that the wound could be other than a tangential wound, he only did so after being asked one of Arlen Specter's infamous leading questions...

Mr. SPECTER - The physicians, surgeons who examined the President at the autopsy specifically, Commander James J. Humes, H-u-m-e-s (spelling); Commander J. Thornton Boswell, B-o-s-w-e-l-l (spelling), and Lt. Col. Pierre A. Finck, F-i-n-c-k (spelling), expressed the Joint opinion that the wound which I have just described as being 15 by 6 mm. and 2.5 cm. to the right and slightly above the external occipital protuberant was a point of entrance of a bullet in the President's head at a time when the President's head was moved slightly forward with his chin dropping into his chest, when he was riding in an open car at a slightly downhill position. With those facts being supplied to them in a hypothetical fashion, they concluded that the bullet would have taken a more or less straight course, exiting from the center of the President's skull at a point indicated by an opening from three portions of the skull reconstructed, which had been brought to them---would those findings and those conclusions be consistent with your observations if you assumed the additional facts which I have brought to your attention, in addition to those which you have personally observed?

Dr. CLARK - Yes, sir.

Well, jeez Louise. Specter may as well have asked him "If the doctors said something could be black would you agree it could be black?" As Clark's acceptance of the "official" story was conditional on both Specter's false description of Kennedy's position at the time of the head shot ("with his chin dropping into his chest") and his false description of the trajectory from the entrance observed at autopsy to the large defect on the top of Kennedy's skull ("a more or less straight course"), it's clear that Clark never really agreed with what Specter was selling.

Unfortunately, he rarely spoke on the subject after his testimony. Perhaps we now know why.

I mean, it's not as if Clark's assessment can be rejected out of hand. In 20th Century Arms and Armor, published 1996, military historian Dr. Stephen Bull, while discussing the Mannlicher-Carcano rifle, defends that the rifle was capable of causing Kennedy's wounds. He asserts, not inaccurately, that the rifle was capable of being fired fast enough and with enough accuracy to kill Kennedy as proposed by single-assassin theorists. He also recites a lot of the nonsense spewed by Dr. Baden in his book Unnatural Death, and debunked in chapter 13b of this webpage. Where Bull really slips up, however, is in his description of the second shot to hit Kennedy. He writes: "A second shot clipped the top of the President's skull, shattering it, and broke against the front windscreen strut." The official story on this bullet, of course, is that it did not clip Kennedy's head, but pierced it, exiting only after traveling four inches or so through the brain. That Bull, having written a number of books on WWI and WWII weaponry and tactics, thinks Kennedy's large head wound was created when a bullet "clipped" the top of his head, is undoubtedly supportive that this could indeed be the case.

When one considers the possibility that Dr. Clark's original analysis was correct, and that the fatal bullet struck tangentially, in fact, a lot of otherwise confusing evidence suddenly falls in line. At the post-mortem inspection of the brain, the doctors noted what are called contre-coup lesions of the brain, bruises obtained from smashing against the inside of the skull. These are most frequently found opposite the point of impact. It's undoubtedly supportive, then, that the lesions described in the supplemental autopsy report (the photos have never been released) were chiefly on the left side of Kennedy's brain, opposite the large defect by the temple and not on the frontal lobe, opposite the HSCA entrance.

And these were not the only areas of damage consistent with the wound's being a tangential wound. Forensic Neuropathology, by Jan E. Leestma (2008), relates: "Tangential wounds may cause significant injuries, especially from high-velocity missiles. These may produce gash-like wounds and form gutter-like depressed fractures in the skull. In such cases, the underlying brain will have extensive superficial contusions adjoining the fracture, even if the dura remains intact, which are caused by the slapping effect of the inbending bone." This suggests that, in opposition to the damage one would see on a brain that had simply exploded outwards, the cortex or outer layer of a brain that had received a tangential wound--where the skull had been pushed inward--would have severe contusions or even lacerations adjacent to the defect on the skull. It would seem to be consistent then that both the Clark Panel and the HSCA Pathology Panel, after studying the photographs of the brain, noted that the mid-temporal region of the right side of Kennedy's brain--the region just below the large defect--was "depressed," and its surface "lacerated."

And then of course, there's the gutter itself. While Secret Service agent Clint Hill was later to recall that there was a skull piece about the size of his palm missing from above Kennedy's right ear, and that "It looked like an ice cream scoop had gone in and removed the brain from that area," we needn't rely upon the distant memories of a layman. While the original autopsy report had noted a "longitudinal laceration" with a "considerable loss of cortical substance above the base" of the brain, and while the Clark Panel, after studying the autopsy photos, had similarly noted that the right side of the brain was "transsected by a broad canal" running parallel to the midline, and that "much of the roof of this canal is missing," the HSCA Pathology Panel had simply described a "cylindrical groove in which the brain

substance is fragmented or absent" extending from the "back of the brain to the right frontal area of the brain." This sounds like a "gutter" to me.

And not just me. Perhaps unaware of the implications of his words, Larry Sturdivan, in his book *The JFK Myths*, admits "The autopsy photographs of the brain show a massive 'gutter' wound of the right cerebral hemisphere..." Strangely, however, he then adds "...that leads from the entry wound on the back of the skull to the exit wound at the front edge of the blown-out area of the skull." Perhaps he'd forgotten that, for his book, he'd changed his impression of the entrance wound location, and now placed it down by the EOP, and that every doctor to look at the brain photos going back to the 1960's had specifically ruled out that there was a bullet track heading upwards in the brain starting at this location.

The tearing and loosening of the falx cerebri, a process of the membrane (the dura mater) which covers the brain, and which can be found between the brain's hemispheres, is also intriguing. This loosening, which was first noted by Dr. Boswell on the back of the autopsy face sheet, ("*Falx loose from sagittal sinus from the coronal suture back*") suggests the bullet creating the large head wound impacted near the top of the head (the location of the sagittal sinus, and the center of the area of loosened membrane), and not on the back of the head. *War Surgery*, one of the first books on wound ballistics, written by the French World War I surgeon Edmond Delorme, spells this out, declaring: "*At the aperture of entry the dura mater is torn and loosened: at the exit it is perforated, but not loosened.*" Delorme would almost certainly have seen dozens if not hundreds of head wounds caused by rifles similar to Oswald's Mannlicher-Carcano. His observations should not readily be dismissed.

Still more reasons to suspect the fatal bullet struck tangentially come from studying the Zapruder film. When one projects a bullet traveling downwards at 12 degrees (15 degrees from the sniper's nest minus the 3 degree slope of the street) onto Z-312, one finds that a bullet fired from the sniper's nest and just missing the back of Kennedy's head would most logically strike him directly above his ear, where Zapruder frames 313 and 337 reveal the large wound to begin. Since, as we've seen, Kennedy's skull was tilted 25 degrees to its left, this means the presumed impact location above the ear was at the very top of his skull, and directly in the line of fire. Not surprisingly, a nose of a bullet striking Kennedy's skull and breaking up in this location might continue on to hit the windshield without traversing the right side of his skull. When one looks closely at Zapruder frame 313, moreover, it becomes obvious that there is a large bone fragment (almost undoubtedly the Harper fragment, the largest bone fragment found outside the limousine) flying upwards from the President's skull at a right angle to a trajectory from the school book depository. As any pool player will tell you, this would be the expected trajectory of a fragment exploding from an impact with a bullet just barely hitting the President on the right top of his head.

It is ironic, then, that the HSCA actually considered the possibility the large head wound was a tangential wound, but rejected it due to the fact such a wound would be unlikely for a shot fired *from the grassy knoll*. That's right. They were that close. On page 226 of Volume 7 of the HSCA's report is a 12-22-78 letter from radiologist David Davis noting that in light of the HSCA's acceptance of the acoustic evidence suggesting a shot had been fired from the grassy knoll, he and Dr. Michael Baden had considered the possibility the fatal shot had come from the knoll. From their discussions, moreover, they concluded that it was possible the large head wound was a tangential wound inflicted from the side *if* the top of Kennedy's head was tilted 22 degrees away from the bullet. As the knoll location pondered was in fact 15 degrees above Kennedy at the time of the head shot, however, they were forced to conclude Kennedy would have to have been leaning 37 degrees to his left for a tangential wound to result. And this they could not accept.

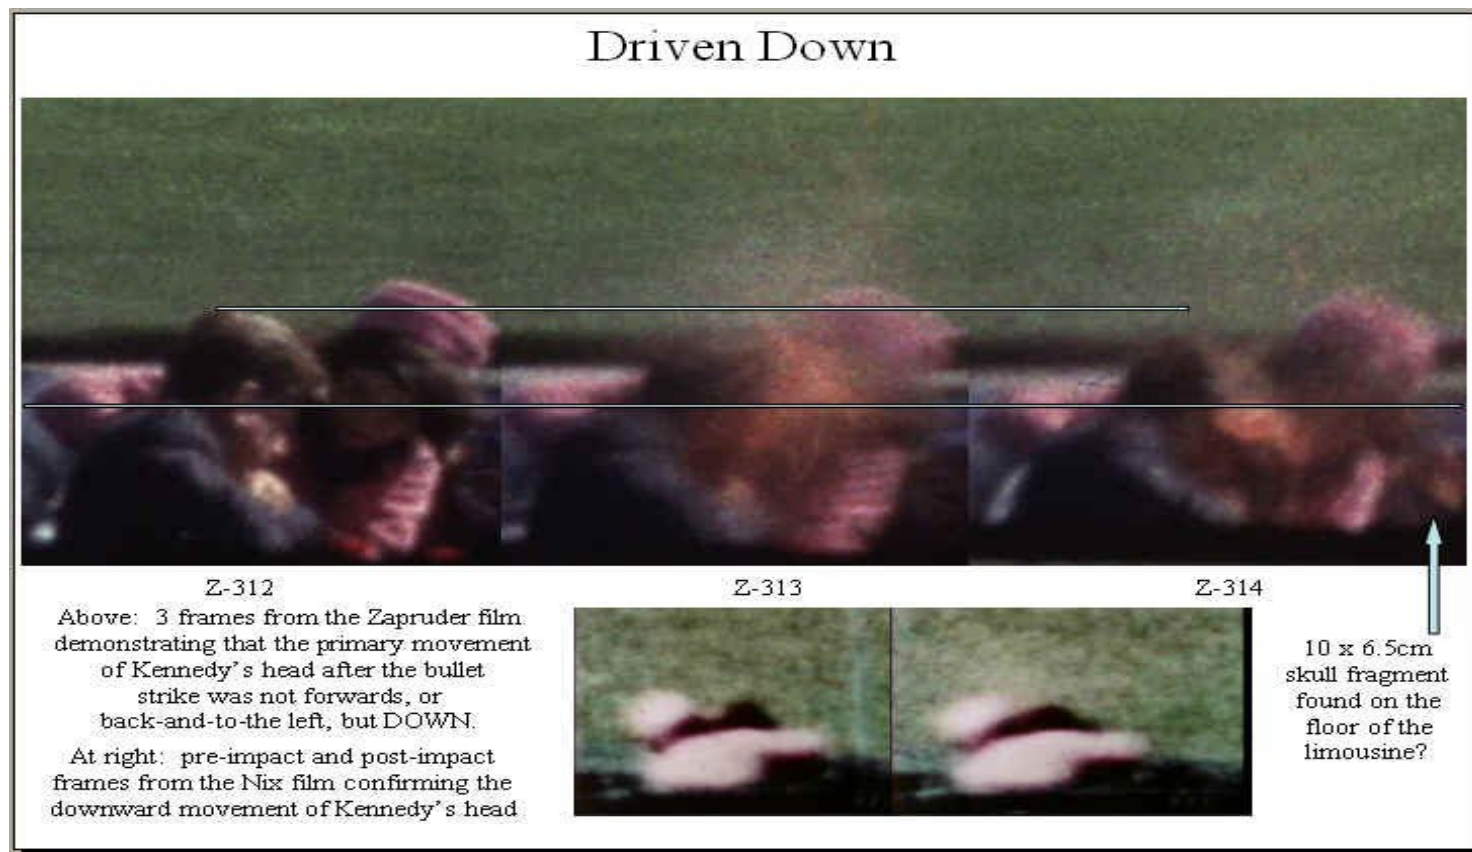

While we can agree with them on this point, or agree to disagree, it is nevertheless enlightening that Dr. Baden considered such a thing, as this indicates he felt Kennedy's large head wound was otherwise

consistent with a tangential wound.

There is reason, in fact, to suspect that many other forensic experts share this appraisal. In 2009, legendary forensic scientist Dr. Henry Lee, along with forensic scientist Elaine Pagliaro, and forensic psychologist Katharine Ramsland, published *The Real World of a Forensic Scientist*. Rave reviews by forensic experts Cyril Wecht, Michael Baden, Fredric Rieders, James Starrs and Ronald Singer graced its back cover. These reviewers had obviously been provided copies well prior to publication. If they'd noticed any obvious mistakes then, we can only assume, they'd have said so, and these mistakes would subsequently have been corrected. And yet, on page 147, while briefly discussing the Kennedy assassination as an example of a case where forensic examiners disagree in their interpretation of the facts, the writers reported that a "shot entered Kennedy's right temple and exited through his skull."

It "entered Kennedy's *right temple*!" Not the back of his head. And "exited *through* his skull!" This strange use of words doesn't specify a separate exit, or even a direction of fire. Hmmm... Are we to assume from this that *no one* involved in the writing or reviewing of this book noticed this?

I don't know. It seems quite possible, however, that this detour from the official story went right over everyone's head because it sounded so reasonable, and that it sounded so reasonable because it was something they'd secretly suspected was true.

Driven Down

Perhaps then we should take a closer look at the movement of Kennedy's head after the impact of the head shot. As the skulls in Dr. Olivier's tests always but always moved in the direction of the bullet, perhaps this can tell us from which direction the bullet was fired.

As a measurement of the length of Jackie Kennedy's arm in frames 312 and 313, from her elbow to the back of her husband's head, indicates that more arm was visible in 313, and thus, that her husband's head moved forward, one can safely assume the fatal shot came from behind. But that's only half the story.

While there has been a seemingly endless argument between stubborn conspiracy theorists, who insist Kennedy's head flew back-and-to-the left after the bullet's impact, and nearly everyone else, who note that his head first flew forwards, both sides of the issue miss an important fact: the primary movement of Kennedy's head in the first few frames after the bullet's impact was downward. His head dropped approximately 2 inches in 1 ½ frames of the Zapruder film. As a hard impact low on the back of a man's head in the location of the bullet entrance described at autopsy would most logically pop the front of his head upwards a bit, I believe this downward movement suggests instead that Kennedy was hit *on top* of his head just above his right temple.

Is it proof? Not remotely. But it sure is interesting that my study of the medical evidence is supported by my study of the Zapruder film, and vice versa.

And it sure is interesting that others have seen what I see. In his 1976 book, JFK: The Case For Conspiracy, in his chapter on the Zapruder film, Robert Groden wrote that at frame 313, "A shot hit Kennedy from behind, *by all appearances*, in the right temple." He then followed Josiah Thompson's lead and claimed that a *second* shot impacting but one frame later hit Kennedy from the front, knocking him back and to the left.

That's right. Robert Groden, who many consider an expert on the Zapruder film, agreed with my assessment of the impact at frame 313 when basing his impressions purely on the film.

Perhaps he should have stuck to his guns.

Elastic Recoil Revealed

1

2

3

4

5

In this news footage found on the internet, a young hostage-taker is killed by a police sniper firing from his right. The second image shows a small explosion from the entrance on his right side and a larger explosion from the exit on his left side. The third image shows his head moving in the direction of the bullet. By image 4, however, his head has jerked back to its right and is facing upward. This occurs after the explosion from his head, and is therefore not the "jet effect." He does not squeeze the trigger and his body falls limp to the ground, so it is not a "neuromuscular response." What is it then? I propose that it's simply elastic recoil of the neck muscles. His head is pushed hard to its left and it springs back. It's that simple. This can explain Kennedy's "back-and-to-the-left" movement as well.

Elastic Recoil Revealed

Since the Zapruder film shows Kennedy's head going back and to the left after the fatal head shot, conspiracy theorists have long held this means the shot came from the front. This has not impressed single-assassin theorists, however, who just love to point out that Kennedy's head initially goes forward. These theorists also love to use supposedly scientific explanations, e.g. the "jet effect" and the "neuro-muscular response," to try and explain Kennedy's subsequent movement backward.

When I started suspecting that the head shot hit Kennedy at the supposed exit, on the other hand, one of the first things I did was slap myself at this exit location from behind, to see if this impact would re-create Kennedy's movements. To my surprise, it did.

I subsequently learned that there is a certain elastic recoil in muscle tissue. You stretch it out far enough, and it snaps right back on its own. Some runners learn to use this to their advantage. This led me to believe that Kennedy was hit towards the top of his head, his head was driven down, his chin hit his chest and his head sprang back up from the recoil of his neck muscles.

In July 2007, researcher Gil Jesus alerted the Education Forum to a number of videos he found online, depicting head shots. One of these was news footage of a hostage-taker getting killed by a sniper. The shot came in from the man's right. The man's head turned to his left, traveling with the bullet. Then snapped back to his right, facing the sky as he fell to the ground. Not enough fluid was ejected from

his head to create the "jet effect." His body failed to stiffen as in a neuro-muscular response. This video is now available here <http://www.youtube.com/watch?v=JGe1zb1wAIY>

(In 2010, I noticed that the link provided by Gil Jesus was no longer active, and asked if anyone knew a current address for the video. In September 2010, Martin M sent me a fresh link. Thanks, Martin.)

Kennedy contorts in a similar manner, only more vertically. This is consistent with his getting hit more towards the top of his head, at the supposed exit.

It's time we watch the Zapruder film. As you watch the film below, ask yourself: is there any evidence the bullet struck Kennedy on the BACK of his head? Is there any evidence it struck him from in FRONT? Just watch the film. If one divorces oneself from what one's been told about the direction of the head shot, I suspect you'll come to agree that the film suggests a shot hit Kennedy on the top of his head above his right temple...from his right, and from behind.

(This Gif file was posted online by Robin Unger, and can be activated by clicking on frame 312 below. After you're done watching, just hit the back button on your computer and you will return back here. Thank you, Robin.)

Should one continue to doubt such a shot occurred, and insist that the "back-and-to-the-left" movement of Kennedy's skull could only have come from the front, I suggest a simple test. I've done it way too many times. Lean forward 30 degrees...tilt your head 25 degrees to your left... and SLAP the top of your skull above your ear downwards, and see what happens. NO. I'M KIDDING. Don't do this!!! It

hurts a bit. Take my word for it, instead,--your head will bounce right up and throw your body backwards, exactly as Kennedy's did in the frames after the fatal headshot. (By the way, I'm not just making this up. This unique attribute of tangential hits is mentioned in the online paper Wound Ballistic Simulation by Jorma Jusilla, presented at the University of Helsinki: It states "*A tangential hit also causes a torsion motion of the head which can cause serious injuries.*" According to Funk and Wagnall's, the word "torsion" means "*The act of twisting.*" I say that in case you might need to look it up. I did.)

In retrospect, the mystery over the cause of Kennedy's back-and-to-the-left movement should have been solved a long time ago. All the debate over the "man behind the picket fence," the "jet effect" and "neuro-muscular response" would have been unnecessary if someone used some common sense back in 1964. People knew the bullet broke up. People knew that bullets normally pierce a body without imparting enough energy into the body to throw it one way or the other. People knew that, on the other hand, a bullet striking tangentially, creating a gutter wound, and breaking up, could impart enough energy upon impact to slap a person one way or the other. People knew as well that the Zapruder film showed Kennedy being slapped back into his seat. The problem, one can only guess, is that the people knowing these things were not the same people.

The movements of Kennedy apparent in the Zapruder frames following the head shot, when taken in conjunction with the evidence previously discussed, including the fact that no bloody back spatter emanates from the back of Kennedy's head in the film, can therefore be taken as a clear indication the bullet striking Kennedy at frame 313 struck his skull at the supposed exit, most probably from behind.

We should have listened to Bobby Hargis. Hargis, who rode a motorcycle in the motorcade to the left of Mrs. Kennedy, not only witnessed the head shot from quite close, but reported, within days of the shooting that Kennedy "got hit in the side of his head, spinning it around."

He was on it from the beginning. But no one was paying attention. Some apparently wanted his words to suggest Kennedy was shot from the front, and so ignored the key part of his statement: that the bullet's impact imparted a spinning motion to Kennedy's head. Such a motion, as we've seen, is entirely consistent with the creation of the tangential wound described by Dr. Clark.

But is there any way we can further clear this up, and scientifically determine the direction of the bullet?

Harper Fragment Analysis

Harper Fragment Analysis

Yes. A study of the Harper fragment can help us make such a determination.

On 11-23-63, after Billy Harper found a skull fragment in the Dealey Plaza infield to the left and forward of the President's location at frame 313 of the Zapruder film, he showed it to his uncle. His uncle, who happened to be a doctor, brought the fragment in to a local hospital the next day and showed it to some of his colleagues. He then gave it to the FBI. Strangely, no one knows for sure what happened to it after this. There is evidence that the FBI, after running some tests, gave the fragment to Kennedy's personal physician, Dr. Burkley, on 11-27. It is fairly clear as well that even though the autopsy doctors had yet to finish their supplemental autopsy report on 11-27, and even though Dr. Burkley was in contact with the doctors during this time, he somehow failed to tell the doctors of the fragment's existence. Secret Service Agent Clint Hill, however, in his testimony before the Warren Commission, mentioned that "a medical student or somebody in Dallas" had found a skull fragment in the street on the day after the assassination. As Hill continued on with the Kennedy family after the assassination, this could be an indication that Dr. Burkley did in fact give the fragment to the family. The HSCA concluded that Bobby Kennedy acquired the fragment and either destroyed it or buried it along with his brother's brain and tissue slides.

It is from the HSCA interview of one of Dr. Harper's colleagues, Dr. A. B. Cairns, a pathologist, and the photographs Harper's colleagues made available to researchers, that we've come to learn most of what we know about the Harper fragment. Dr. Cairns told the HSCA that he believed the fragment came from the occipital bone, down near the spine. Since the fragment was found in front of Kennedy's location at Z-313, and since the Zapruder film shows it flying upwards from the front half of Kennedy's skull, this makes little sense. Dr. Lawrence Angel, Dr. Joseph Riley, and Dr. Randy

Robertson, among others, place the bone in the parietal area, above the right ear. This means that an area on the outer edge of the fragment is exactly where I suspect the bullet first struck Kennedy. That Dr. Cairns reported “*grayish discoloration*” indicative of “*lead-caused damage*” in this area would seem too much a coincidence, particularly in that Dr. Humes' and Dr. Boswell's assistant at the autopsy, James Curtis Jenkins, was later to tell writer Harrison Livingstone that “just above the right ear there was some discoloration of the skull cavity with the bone area being gray and there was some speculation that it might be lead.” While the FBI did studies on this fragment and reported no such lead, researcher John Hunt has located the x-rays in the National Archives and believes they do in fact confirm the presence of lead.

We should recall here that lead was noted on the large triangular bone fragment found on the floor of the limousine, and that the outward beveling of the skull at this location helped convince the autopsy doctors the large defect on top of Kennedy's head, from whence this fragment derived, was in fact an exit. In his online review of the autopsy materials, written after his 2004 visit to the National Archives, Larry Sturdivan discussed these lead deposits in some detail. Sturdivan observed: *“The lead fragments on this bone could not have been secondary deposits, stuck by clotted blood. As this fragment was dislodged in the explosion, the fragments had to be deposited into the surface of the bone by the bullet core.”* This led him to conclude: *“Lead deposits inside the cratered area indicates that the bone had already cratered before the core scraped by. This may mean that the leading surface of the bullet fragments was jacket...”* Thus, Sturdivan admitted it was likely the bullet broke up at this location, and not after striking the windshield strut, as purported by Dr. Baden.

It's nice to find there's something on which we agree. That similar lead deposits have been noted on the Harper fragment, moreover, add considerable weight to my suspicion these two bone fragments comprise the vast majority of the large defect the autopsy doctors concluded was an exit.

But there's a problem with this. The grayish discoloration on the Harper fragment is on the outside of the fragment. This suggests that the bullet broke up while *entering* the skull above the ear, and not while exiting. That the “lead deposits inside the cratered area” observed by Sturdivan were observed on X-rays, whereby one could not tell whether the fragments were on the inside or outside of the skull, and that NO photographs were taken of the large fragment studied by Sturdivan, moreover, suggests the possibility the large defect determined to be an exit was really an entrance, and that the photographic proof for this was either deliberately not recorded, or subsequently destroyed.

The photos of the Harper fragment illuminate this possibility, and offer compelling evidence that Kennedy's large head wound was a tangential wound of both entrance and exit. The underside of the fragment reveals internal beveling, indicative of a bullet entrance, towards the back, and external beveling, indicative of an out-shoot, towards the front. This is indicative of a tangential entry fired from behind. As the in-shoot and out-shoot run along the bottom edge of the fragment, moreover, an upward lift of bone until it snapped off along its edge, spinning upwards, can easily be imagined... and seen... as such an explosion is forever captured in Z-313.

P.S. When one compares Dr. Angel's drawing on the slide above to the lateral x-ray, it becomes clear that Dr. Angel placed the Harper fragment too rearward on the skull. This, to my mind, does little to debunk his placement of the fragment as parietal bone, based upon its anatomic features. It does, however, call into question his ability to match x-rays and photos to actual skulls... This, then, lends support to my position that he mistakenly interpreted the so-called “mystery photo” (see chapter 13b) as a photo taken from the front of Kennedy's skull, when it was really taken from behind.

Keyhole Analysis

A 1982 article in *The American Journal of Forensic Medicine and Pathology* gives us an additional reason to suspect the Harper fragment was the upper margin of a tangential wound. Intriguingly, this article was written by HSCA medical panelist Dr. John Coe, only three years after his HSCA experience. Coe wrote *"In the grazing wound of the skull showing external beveling, there is an elongated perforation of the bone in which one end of the perforation resembles the usual entry wound, while the opposite end of the defect has the external beveling associated with an exit wound. The most common explanation is the bullet, by penetrating the bone tangentially, is split or shaved. One portion of the bullet proceeds into the cranial vault, while the second portion is deflected outward, exiting the bone almost immediately after its penetration of the outer table. This deflected portion, in leaving the bone, produces external beveling in the usual manner."* Could this explain why the lower edge of the Harper fragment appears to include both internal and external beveling? Or is it just a coincidence that this edge appears to match the characteristics of a "keyhole" entrance representing both entrance and exit? Is it also a coincidence that this "keyhole" seems to be running 6 degrees from left to right across the skull, which matches the angle leading back to the Texas School Book Depository we've already calculated? (The Moorman photo showed us Kennedy's head was turned 14 degrees to his left. Since the school book depository was 8 degrees to his right at Z-312, this would indicate the bullet traveled 6 degrees to the right along his skull.)

Medicolegal Investigation of Death, by the Clark Panel's Fisher and the HSCA's Spitz, described keyhole wounds in a similar manner: *"A shot fired at a curved part of the head at a shallow angle often causes a typically inward-beveled entrance hole adjacent to an outward-beveled exit hole, producing a keyhole-shaped defect in the skull. A fragment of the slug shaved off by the bone at the entrance hole may penetrate the brain...Fracture of the orbital roofs...are occasionally seen in the cases of keyhole type wounds involving the top of the head or forehead. Eyelid hemorrhage on the same side may result from the seepage..."* As the description of the fractured orbits (eye sockets) and hemorrhage on the eyelids could have been taken from Kennedy's autopsy report, and as the shaved off fragment of a bullet hitting tangentially would appear to be the best explanation for the bullet "slice" visible on Kennedy's x-rays, it seems quite possible that Fisher, Spitz, and even Coe were writing about Kennedy's death, whether they realized it or not.

Although Coe's article was written specifically about handgun wounds, and Spitz and Fisher were more equipped to write about low-velocity gunshot wounds than high-velocity gunshot wounds, there is reason to believe that keyhole wounds can be created by both low-velocity ammunition and high-velocity ammunition. In his 1999 book *Gunshot Wounds*, Dr. Vincent Di Maio discusses keyhole wounds of the bone in much the same language as Coe, then adds *"In a less common variant of keyhole wounds, the bullet does not split but enters the cranial cavity intact. This type of keyhole wound is common with full-metal jacketed bullets."* Full-metal jackets are most normally associated with military rifle ammunition, and are not normally associated with low-velocity handgun ammunition.

Dr. Douglas S. Dixon also associates "keyhole" wounds with rifle ammunition. In *Management of Gunshot Wounds*, he writes: *"In head wounds inflicted by large caliber handguns, rifles, and shotguns especially at closer ranges, the forces which accompany the projectile form a large temporary cavity that causes the skull to expand greatly. Reconstruction of the bony fragments may reveal the previously discussed configurations of beveling, keyhole lesions, or pattern of intersecting fractures; this is often best accomplished at autopsy."* Implicit in these words is that, due to the skull's fragmentation, a keyhole entry resulting from rifle fire can sometimes be discovered through the inspection of the available skull fragments at autopsy. Is it a coincidence then that the Harper fragment, which was discovered just one day after Kennedy's demise, was not brought to the attention of the men still writing his autopsy protocol? While the final draft of the autopsy report was turned in on the 24th, and

the fragment not given to the FBI until the 26th, the doctors' supplementary examination of the brain and tissue slides was still over a week away. Why weren't the autopsists shown this fragment, or even told of its existence? The 11-26-63 report of Agents Sibert and O'Neil on the autopsy made note that Dr. Humes had opted to hold on to the 10 x 6.5 mm beveled bone fragment of the President's skull, but that he would make it available for further examination. This proves the FBI knew the doctors had an interest in such things. An 11-27-63 memo on Dr. Burkley's receipt of the Harper fragment noted it was to be "turned over to Naval Hospital by Dr. Burkley for examination, analysis, and retention until other disposition is directed." So why weren't the doctors shown the Harper fragment?

Dr. Mantik and Mr. Harper

Across the top: three images from Dr. David Mantik's monograph "Twenty Conclusions After Nine Visits." At left: Dr. Mantik's placement of the Harper fragment. At center: an alternative to Mantik's placement. At right: Kennedy's right lateral X-ray, with Area F, which Mantik felt was abnormally dark, and Area P, which he concluded was far too white, noted. While writer Jim Douglass and others have taken from this that Mantik believes Area P represents a patch to cover the hole from which the Harper fragment had been blasted, a close look at Area P and Mantik's placement of the Harper fragment prove this to be untrue.

At right: a map marked by William Harper for researcher Howard Roffman in 1969, noting the location south of the steps where Harper found a fragment of President Kennedy's skull. Red star marks the location about a hundred feet away where President Kennedy was shot. Red line reflects approximate trajectory from the sixth floor sniper's nest.

Dr. Mantik and Mr. Harper

Ironically, the true importance of the Harper fragment has long been overlooked not through the actions of single-assassin theorists, but conspiracy theorists... They just won't accept that the fragment was dislodged from the top of Kennedy's head and that this wound could represent both an entrance and an exit...

Let me explain...

From dozens of witnesses claiming to have heard shots from west of the depository, and a half dozen of more claiming to have seen smoke on the grassy knoll after the shots, the vast majority of conspiracy researchers have long felt the fatal shots were fired from in front of Kennedy. That suspicion, when coupled with the recollection held by so many witnesses at Parkland Hospital--that Kennedy's large head wound was on the *back* of his head--has led them to accept that a shot fired from in front of Kennedy blew out the back of his head. As Dr. Cairns believed the Harper fragment was occipital, moreover, it seems totally obvious to them that the Harper fragment was blown out the back of Kennedy's head. It totally adds up. It totally makes sense.

That the Harper fragment was blown out the back of Kennedy's head has become such a tenet of the conspiracy theorist "religion," in fact, that Don Thomas, in his book *Hear No Evil*, was reluctant to dispute it, *even though he readily accepted that the Harper fragment was NOT occipital bone*. That's right. In one of the strangest statements in what I've come to conclude is a very strange book, Thomas claimed that the Harper fragment was "a piece of the posterior parietal bone which was driven out the rear of the president's cranium." Now, that's just bizarre. Dr. Angel, upon whom Thomas relied for his assessment the fragment was parietal, placed the fragment at the top of Kennedy's head. Kennedy's head was leaning forward at frame 313. Thomas believes the shot was fired from in front. There is simply no way a skull fragment from the top of Kennedy's head where Angel placed it could be driven out the rear of his head, when his head is leaning forward, and Thomas knows it. One can only conclude, then, that Thomas was trying to have it both ways, and had decided to ignore Angel's placement of the bone at the top of Kennedy's head, and to pretend instead that it sprang from the back of his head...in the parietal area...where no doctor had claimed it had sprung, and where it clearly did not fit...

But what of the others? Those believing the Harper fragment occipital bone? Well, let's just say they are on firmer ground than Thomas...

Until one looks at the autopsy photos and X-rays... and the assassination films... and studies the statements of those witnessing the shooting... and closely studies the writings of those pushing this scenario...

Let's take, for example, Jim Douglass, in *JFK and the Unspeakable* (a book I recommend under the proviso one not take the specifics of the crime he describes too seriously):

On page 283, Douglass discusses the research of Dr. David Mantik, who, over nine visits to the National Archives, observed what he called a "patch" toward the back of Kennedy's lateral skull x-rays. (This will be discussed in much greater detail in chapters 18 and 18b.) Here is how Douglass, and all-too many conspiracy theorists, present Mantik's findings:

"There was far too much bone density being shown in the rear of JFK's skull relative to the front. The X-ray had to have been a composite. The optical density data indicated a forgery in which a patch had been placed over an original x-ray to cover the rear part of the skull--corresponding to the gap left in part by the Harper fragment, evidence of an exit wound. The obvious purpose was to cover-up evidence of a shot from the front that, judging from the original Parkland observations, had created an exit hole the size of one's fist in the back of the head..."

Douglass later concludes this line of thought: *"In the case of the the government's X-rays, their exact duplication of the Harper fragment, as if that bullet-blasted bone were still in the slain president's skull, has turned out to be the revelation of the cover-up."*

So there you have it. The Parkland witnesses said there was a hole on the back of Kennedy's head. Dr. Cairns said he thought the Harper fragment came from the back of Kennedy's head. Dr. Mantik shares this conclusion. Dr. Mantik has also concluded there is a white patch on the back of Kennedy's lateral X-rays. ERGO, we can assume the white patch was created to conceal the hole on the back of Kennedy's head from where the Harper fragment was blasted. This is supported, furthermore, by the Harper fragment's being found 25 feet south of the assassination site...which means it landed behind the limousine.

This is how all too many--dare I say most--conspiracy theorists view the evidence.

The problem is...IT'S JUST NOT TRUE.

Just ask Billy Harper...

While the early reports on Harper's finding of the fragment do indeed claim he found the fragment 25 feet south of the assassination location, and while writers such as Mantik extrapolate from this that the fragment was found *"not too far from where Jean Hill had been standing"* behind Kennedy's location at the moment of the fatal head shot, Harper was not a witness to the shooting, and only found the fragment the next day. By that time, mourners had gathered opposite the steps in front of Kennedy at the time of head shot. This is shown in numerous photos. This raises the question, then, of whether or not Harper, when first interviewed, had known that Kennedy had actually been shot before reaching this location.

Fortunately, we have an answer to this. In 1969, researcher Howard Roffman contacted Harper and asked him to mark on a map where he found the fragment. Sure enough, Harper marked a location to the south of the steps in a location approximately 100 feet in front and slightly to the left of Kennedy at the time of the actual head shot. And this was no one time thing. He has marked similar maps for others. The evidence, then, suggests the Harper fragment was not blown out the back of Kennedy's head, as pushed by most conspiracy theorists, but was blown forward from the top of his head, as depicted in the Zapruder film.

Well, then what about Dr. Mantik...

In the very paper Douglass cites as support for the nice, neat scenario described above, Dr. Mantik refutes much of Douglass' scenario. First, as seen on the slide above, while Dr. Mantik concluded the Harper fragment derived from the back of the skull, he concluded it derived from the central part of the back of the skull, NOT from the location of the wound to the right of mid-line described by the Parkland witnesses, NOR in the location on the right where he'd discovered a white "patch" on the x-rays.

(In a 10-11-10 post on the Education Forum, Dr. Mantik addressed this very point. In comments posted by Dr. James Fetzer, Mantik's biggest supporter, Mantik admitted *"I have never demonstrated exactly where on the lateral skull X-ray the Harper would appear, but it would be at the very rear."* He had thereby confirmed my claim. Neither the wound described by the Parkland witnesses nor the location covered by the "white patch" are at the very rear.)

Second, while Dr. Mantik, during an 11-18-93 press conference announcing his conclusions regarding the so-called white patch, was reported to have claimed that *"someone...put a great white patch on the back of the lateral X-ray to cover up the hole, which is why the area is so extraordinarily white,"* he claimed a decade later, in the paper cited by Douglass, that the *"white patch was almost certainly added in the dark room. Its purpose was to emphasize the resulting dark area in front, which suggested that a bullet had exited from the front."*

Read Mantik's 2003 paper, containing his ultimate conclusions, if you don't believe me:

<http://www.assassinationresearch.com/v2n2/pittsburgh.pdf>

(In the 10-11-10 post by Fetzer, Dr. Mantik responded to this point as well. He wrote: *"The original lateral X-ray probably showed missing BRAIN in the current area of the WHITE PATCH. It was the missing brain, not missing skull, that likely led to the WHITE PATCH."* He'd thereby confirmed my claims a second time.)

Jim Douglass was wrong. Mantik had not concluded that the "white patch" at the rear of the skull corresponded *"to the gap left in part by the Harper fragment."*

Mantik's observations reveal his own bias, however. While the good doctor, true to the beliefs of most conspiracy theorists, concluded the Harper fragment was occipital bone, the reasons he gives for rejecting Dr. Angel's conclusion it was parietal bone are remarkably contrived. First, in the paper at the link above, he claims that Angel *"did not know that occipital bone was missing so this site at the top of*

the head was his only option." Uhhh... Dr. Angel had been provided both the autopsy photos and x-rays, which showed no occipital bone to be missing. So how was Angel to find out it was missing? From the say-so of Dr. Cairns, who only guessed that the Harper fragment was occipital? Second, once again in the paper linked above, he rejects Angel's conclusion chiefly because Angel's conclusion would imply *"a parietal entry (because the lead smudge is on the outside), an option that virtually no one would support."*

While I'd hoped to have changed that, in September 2010, I received an unexpected slap in the face. While viewing Dr. Mantik's presentation at the 2009 JFK Lancer conference in Dallas, it became clear that Dr. Mantik had not only failed to acknowledge that Angel's orientation for the fragment could be correct, as it put the lead smudge near Kennedy's temple, and suggested an entrance, but that he'd added insult to injury. Yes, unbelievably, he not only dismissed Dr. Angel's orientation for the fragment, but claimed the lead smudge in Angel's orientation proved it was incorrect, as it would be on the top of the head, and nowhere near the entrance or exit proposed by the HSCA.

Well, as you can see on the slide above, this just isn't true. The location of the lead smudge Mantik designates with an arrow in the image at left would be near the temple on the skull in the middle image, and not on the top of the head.

So how does he get off claiming it was on the top of the head?

He couldn't just move it, could he?

Yes, unbelievably, in his 2009 JFK Lancer presentation, Dr. Mantik moved the location of the "metallic debris" or lead smudge on the Harper fragment for the slide showing Dr. Angel's orientation for the fragment, from where he'd placed it on the slide showing his own orientation. (This is demonstrated [here](#).)

Now, I'd like to believe this was just a mistake, and not part of some stupid plot to avoid admitting that the Harper fragment most probably derived from somewhere other than the middle of the back of the head.

When I pointed out Mantik's switcheroo in a 10-12-10 post on the Education Forum, however, I received this response from Dr. James Fetzer, Mantik's biggest supporter:

"Pat Speer may be among the least competent students of JFK I have ever encountered. We all know that the Harper fragment was occipital bone, so it is not difficult to locate on the skull...I think he owes David Mantik an apology."

I'm sure Dr. Fetzer would love to have left it at that.

The next April, in a review of Don Thomas' Hear No Evil, however, Dr. Mantik admitted he'd changed his interpretation of the smudge location. He insisted that his earlier interpretation of the smudge (in which it was near the EOP in his orientation and by the temple in Dr. Angel's orientation) was based upon the photos of the Harper fragment, but that the x-ray of the Harper fragment showed it to have been where he'd moved it on the slide presenting Angel's orientation. He failed to explain why, if he'd truly re-interpreted the smudge location after viewing the x-rays, which he'd first viewed in 2003, he'd told his 2009 JFK Lancer audience "Here is where there's metal debris" while pointing out the old location near the EOP, and then explained that the smudge or metal debris on the Harper fragment was

"right near the External Occipital Protuberance, where the pathologists said the bullet had entered." Perhaps he'd meant to add "Or so I used to think..." but then forgot...

In any event, that his "old" location was in fact correct, and that his "new" location was 100% in error is proven [here](#).

To be fair, however, I should reiterate that Mantik and Fetzer are not the only ones spewing nonsense about the Harper fragment. In *Head Shot*, published 2010, research physicist G. Paul Chambers revealed his own unique slant.

On page 94, he proposed that the fragment was parietal bone, and cited the work of Dr. Joseph Riley in support. He then flew off the rails. A few pages later, he claimed *"there is a clear and apparent inconsistency with the Zapruder film, taken at the time of the assassination, and the descriptions of the wounds to Kennedy's head provided at the official autopsy. The damaged area shown on the film is consistent, however, with parietal bone (from the side of Kennedy's head) found on the street after the assassination (the Harper fragment). This would be reasonable if the bullet struck Kennedy from the right front side and sheared off part of his skull on the side of his head just forward of his right ear."* He then discussed Dr. Clark's belief the large head wound was a tangential wound of both entrance and exit, and concluded *"a bullet striking from the front side could shear off the piece of parietal (side) bone, propelling it backward to the rear of the vehicle, and ultimately ending up in the street at Dealey Plaza."*

Well, where do we begin? First, there is no inconsistency between the film and the descriptions provided at the autopsy. (This will be discussed in chapter 18c.) Second, the parietal bone is not the side of the head, as suggested by Chambers, but the top and side of the head, and the Harper fragment was too large not to incorporate at least part of the top of the head. Third, the Harper fragment was not found on the street, but on the grass. Fourth, the part of the skull just forward of the right ear was not parietal bone at all, but temporal and sphenoid bone. Fifth, as acknowledged by Billy Harper, the Harper fragment was not propelled backward.

Embarrassingly, Chambers' discussion of the Harper fragment was so riddled with errors that he couldn't even get the date of its discovery correct. He claimed it was found on the day of the assassination, when Harper, who would be in a position to know, said it was found the next day.

The “Missing” Scalp

Final Report - Evaluation of John F. Kennedy Assassination Evidence

Gross Examination: The specimens consist of 4 roughly triangular fragments of dark brown material, each measuring approximately 3 mm in greatest dimension and 1-2 mm in thickness, said to have become detached from a bullet sometime in the past. The surfaces are irregular and slightly reflective in incident light. The specimens are bisected under sterile conditions and one half of each is submitted, labeled 01, 02, 03, and 04 for rehydration and microscopic examination. A core is taken from each of the other halves for DNA analysis. The remaining portions are preserved for possible future study.

Microscopic examination:

01: The sections show small fragments of flattened eosinophilic material resembling superficial epithelium. No nuclei are seen. There are small intracytoplasmic PAS granules suggestive of glycogen. Other stains are noncontributory.
Impression: human superficial skin

02: The sections show eosinophilic material containing several parallel slender fragments of PAS positive material in a thick walled cellular configuration that is not of human origin. These appear to be the legs of an insect (or possibly a saprophytic fungus) that invaded the tissue post-mortem. The intervening material contains small aggregates of orange material appearing to be blood. Other stains are noncontributory.
Impression: human tissue and blood with post-mortem insect invasion.

03: The sections show flattened superficial epithelium with well preserved nuclei. The PAS stain shows glycogen granules and the trichrome shows a thin layer of positive material, possibly underlying muscle. Other stains are noncontributory.
Impression: human skin.

04: The sections show fragments of amorphous unidentifiable eosinophilic tissue with a few small aggregates of black pigment. No nuclei are seen. An immunohistochemical stain for keratin is positive. Other stains are noncontributory.
Impression: poorly preserved human skin and black pigment.

Unlabeled: An additional small fragment of material (initially believed to be fiber or textile but identified as proteinaceous by chemical analysis) was also examined, in an unstained preparation. There are no distinguishing tissue features and the material is slightly birefringent.

Above: CE 567, the bullet nose found in the front of the limousine and the foreign material removed from its crumpled ridges.

At left: the final results of tests conducted on the foreign material by the Armed Forces Institute of Pathology, working with the FBI. The Report was written on 9-16-98, but not released until 1-21-00. Three of the four fragments of foreign material were determined to be skin.

The “Missing” Scalp

Some things are best defined by what they're missing. Accordingly, the evidence that ultimately convinced me the large head wound was tangential was something that was missing: scalp.

The autopsy protocol describes Kennedy's large head wound as follows: *“There is a large irregular defect of the scalp and skull on the right involving chiefly the parietal bone but extending somewhat into the temporal and occipital regions. In this region there is an actual absence of scalp and bone producing a defect which measures approximately 13 cm in greatest diameter.”* Medicolegal Investigation of Death, addresses this issue of missing scalp as follows: *“A point frequently ignored, or forgotten, in comparing entrance and exit wounds is that approximation of the edges of an entrance wound usually retains a small central defect, a missing area of skin. On the other hand, approximation of the edges of the exit re-establishes the skin's integrity.”* The authors of Medicolegal Investigation of Death were Dr. Russell Fisher, of the Clark Panel, and Dr. Werner Spitz, of the HSCA Forensic Pathology Panel. The pathology panel's report was most likely accommodating Spitz, then, when it critiqued the autopsy report's description as follows: *“It is probably misleading in the sense that it describes “an actual absence of skin and bone. The scalp was probably virtually all present, but torn and displaced...”* This, disturbingly, ignores that Dr. William Kemp Clark, the one Parkland doctor to closely inspect Kennedy's head wound, shared the observations of the autopsists, and independently

observed "*There was considerable loss of scalp and bone tissue*" in an 11-22-63 report written before the commencement of the autopsy. (Wasn't this required reading?)

I mean, it's not as if Dr. Clark was shy about sharing his observations. An 11-28-63 article in the New York Herald-Tribune reflects that when describing Kennedy's fatal wound, Dr. Clark claimed "*A very large piece of his skull was blown away...It was one great big hole. It was through this wound his brain extruded and blood poured profusely.*" It's hard to understand how the HSCA panel could believe that "the scalp was probably virtually all intact," over what Dr. Clark claimed was a "great big hole." But perhaps that's just me. Perhaps they'd convinced themselves that Kennedy's torn scalp had been peeled back so that Clark could observe this "great big hole," or some such thing.

In any event, this "missing" scalp returned to center stage on 1-21-00, when the government released a report on tests conducted on CE 567, the nose of a bullet found on the driver's seat of Kennedy's limousine. It had long been observed that there was foreign material on this bullet fragment, and the HSCA had asked that tests be conducted on this material. These tests were not conducted, however, until after the uproar surrounding Oliver Stone's film JFK brought the ARRB into existence, and they asked these tests finally be performed. The results of these tests, initially reported on 9-16-98, were that 3 of the 4 pieces of foreign material were human SKIN, and that the fourth was human tissue. As CE 567 was linked via the neutron activation analysis to the bullet fragments found in Kennedy's brain, and as there was little scalp missing at the small entrance near the EOP, this finding undoubtedly suggests the tangential entrance I've theorized. Those wishing to read the complete report on the CE 567 foreign material should go [here](http://www.jfklancer.com/LNE/fragments/fragreport.html)

<http://www.jfklancer.com/LNE/fragments/fragreport.html>

The significance of this skin is further amplified when one considers that, according to Dr. Vincent J.M. DiMaio, in his standard text *Gunshot Wounds*, that, of all the tissues likely to be found on a bullet, "*Skin was the least commonly encountered.*" DiMaio further specifies that "*In regard to gunshot wounds of the head, bone chips, skeletal muscle, connective tissue, and strips of small vessels were commonly identified. Fragments of brain were present but were not readily recognizable as neural in origin.*" Skin didn't even make the list.

From this it becomes clear that 1) a lack of skin at a bullet wound can be taken as a sign it's an entrance; 2) skin was missing from the large defect; 3) skin is not normally found on bullets; 4) a significant amount of skin was found on a bullet fragment linked to the fragments in Kennedy's brain; and 5) the amount of skin on this fragment is best explained by accepting the proposition this bullet busted up at the site of the large defect after striking the skull at an angle.

It all adds up. It simply makes NO SENSE to believe this skin got attached to the nose of the bullet as it entered the back of Kennedy's skull, and then stayed attached to the nose as it tumbled through his brain, as there was very little skin missing from the supposed entrance on the back of the skull. Simultaneously, it makes NO SENSE to believe this skin attached itself to the bullet upon exit after transiting the skull, as the bullet would have little or no contact with the skin exploding outwards from the skull at the exit. No, the discovery of this skin on the bullet is best explained--no, scratch that, can only be honestly explained--by the bullet's having impacted Kennedy's skull at the large defect, where skin was actually missing. Yes, the skin on the bullet nose proves it. The large defect was a tangential wound, precisely as determined by Dr. Clark on 11-22-63.

Chapter 16c: Confirmation and Disappointment

A discussion and review of the Discovery Channel program JFK: Inside the Target Car

Death by Disco

Above: an unexplained CT scan shown in 2008's Discovery Channel program, JFK: Inside the Target Car. Below: the simulated head in the program used to re-create Kennedy's wounds, after being fired upon. At right: a digitized study of its wounds.

Above: HSCA Exhibit F-33, Kennedy's right lateral x-ray.

Do the head wounds depicted in 2008's JFK: Inside the Target Car resemble the head wound depicted in JFK's x-rays, or even each other?

Death by Disco

On March 23, 2008, an intriguing message appeared on the alt.assassination.JFK message board. Dr. Chad Zimmerman, by then no longer active on the board, returned to pass along that he'd *"been in contact with a television producer that is looking to produce another JFK assassination related episode for the Discovery Channel. He is currently seeking ideas that could be pursued and is looking for input. As most of their shows are CSI styled shows, I would assume that is the style of program they're looking for...If you have an idea, please pass it along on this thread and I will be sure that the producer is made aware of the ideas."*

While some took the opportunity to attack Dr. Zimmerman about his appearance on a previous Discovery (some say Disco") Channel JFK assassination-related episode (see chapter 12b), I took Dr. Zimmerman's approach as sincere, and offered up five suggestions. My second suggestion was to film a head shot on a simulated skull using a camera like Zapruder's, to see if the blood dispersed in the pattern seen in frame 313 of the Zapruder film. Zimmerman seemed to like this idea and responded: *"Regarding the Zfilm splatter, I have an identical Carcano with WCC ammunition, as well as two Zapruder model cameras. I'd also like to see something to that regard."*

Flash forward to October 2008. The JFK assassination forums are abuzz about an upcoming program entitled JFK: Inside the Target Car. I see the list of the people involved. It's the same shooter and the

same Australian crew used in previous Discovery Channel programs on the assassination. I briefly assume it's made up of outtakes from these earlier programs. It rapidly becomes clear, however, that this is indeed a new program, and that they have in fact conducted tests similar to the one test I'd proposed that had met Dr. Zimmerman's approval.

On November 16 the program airs, and both confirms and disappoints. It confirms that my interpretation of Kennedy's head wounds are logical and most probably correct, but it disappoints in that, much as the producers' earlier program *Beyond the Magic Bullet*, it is terribly slanted and fails to tell its viewers the true significance of its findings.

A Summary and Review of the Discovery Channel Program JFK: Inside the Target Car

The program opens by giving a little background on the assassination, and talking about the limousine in which President Kennedy was riding. It flashes on a computer rendering of the limousine, in which the jump seats appear to be in the proper position. This is interesting because the same producers, in their program *Beyond the Magic Bullet*, deferred to animator Dale Myers' depiction of the limousine, in which the seats were 3 1/2 inches further inboard from the door than they were on the limousine's schematic. It seems a bit of a coincidence that they now present the seat in its proper location, now that its exact location is no longer central to their findings. Ever hopeful, I take this as a sign that perhaps this program will be less deceptive than *Beyond the Magic Bullet*.

My hopes are quickly dashed. Up next are two eyewitnesses, Nellie Connally, who rode in the limousine just feet away from Kennedy, and motorcycle officer Bobby Hargis, who rode to the left of the limousine just yards behind. They start to describe the shooting. Instead of letting them finish their stories, however, the program cuts to Gary Mack, curator of the Sixth Floor Museum, and an Associate Producer on the program. Mack relates that many of the witnesses did not recognize the first shot as a gunshot, but that they all knew the second shot was a gunshot. This conceals from those just learning about the assassination and therefore not in the know that Mrs. Connally insisted that the first shot hit the President, and never wavered on this point. It also hides that Hargis heard only two shots, and insisted that no shots were fired before the shot that made the President lean forward, which the program's producers previously proclaimed to be the second shot. It seems clear from this that the program is trying to cut off any speculation that the first shot hit Kennedy, and led him to lean forward. It seems clear as well that the program's creators are trading on the credibility of witnesses such as Connally and Hargis while simultaneously ignoring their recollections. This makes me fearful of what's to come.

But then things get better, if only briefly. The program moves on to discuss the clean-up of the limousine by the Secret Service outside Parkland Hospital and how this compromised the blood-spatter evidence, which could otherwise have been studied to determine the location of the shooter firing the fatal head shot. On one hand, it's refreshing to find that this event can now be reported without a narrator throwing in that "conspiracy theorists claim the limousine was cleaned up" or some such thing. On the other hand, it's discouraging to find that the program's creators are still too tentative to relate that this clean-up, which was reported by numerous eyewitnesses in the days after the shooting, was never investigated by the Warren Commission.

I wonder how this rare admission of a suspicious event is gonna factor in the program's conclusions. We're then given a clue; the program's creators have wrangled up two men--a Dallas motorcycle policeman named H.B. McLain and a bystander named Jack McNairy--who still recall the appearance of the limousine before the removal of the bloody debris. From this it seems likely that the producers intend to re-enact the shooting from the sniper's nest location, along with other locations, and to determine which location creates a debris field most similar to the recollections of these witnesses.

To support that these tests are relevant, and necessary, the program calls once more on Gary Mack. Mack discounts the value of the statements and testimony of those actually hearing the shots by claiming that the acoustics of Dealey Plaza were tested in 1978, and that shots *"echoed all over the place."* He then explains *"If you're at a right angle to the source of the shot, all the experts will tell you, you can't tell where the shots are coming from."* This both overstates the case and ignores the evidence. While it is true that people can have difficulty orienting a high-velocity rifle shot that passes in front of them, it is also true that the 1978 tests to which Mack refers demonstrated that it was quite easy to tell a shot from the sniper's nest from a shot from the grassy knoll, particularly when standing in front of the depository building. Incredibly, more than half those standing in front of the building on 11-22-63 admitted that they thought the shots had come from west of the building, in the vicinity of the grassy knoll. Hmmm. One would think Mack would tell the viewers as much to make the study of a shot from this location more dramatic. Hmmm. His failure to do so makes me suspect the program's creators are out to portray the possibility of a shot from the knoll as a silly conspiracy theory, without a lick of supporting evidence.

But before they can do so, they need to establish which locations, other than the supposed sniper's nest in the Texas School Book Depository, were likely locations for a sniper, and thus in need of testing. At this point the narrator makes one of those statements that can only make one shake one's head. He says there's *"one clue to where the shots came from that no one disputes."* Yep. He's talking about the Zapruder film. It seems clear from this that the program's producers either failed to realize that there are many in the conspiracy research community who doubt the authenticity and accuracy of the film, or are deliberately hiding from its uninformed viewers that such doubt exists. The narrator then recites the currently popular single-assassin theory that Kennedy is shot as he comes out from behind the sign in the Zapruder film. The narrator fails to note that this is not an official theory, but an unofficial one, and that the HSCA--a body whose findings on the medical evidence the program accepts, and the last official body to investigate the assassination--found that Kennedy was first hit around frame 190 of the film, before he went behind the sign. Gary Mack then uses the Zapruder film to place an exact replica of the limousine complete with re-enactors in the exact spot Kennedy was at the moment he received his fatal blow. The narrator then tells the audience that the re-enactors "assume the position of 312," the last frame of the Zapruder film taken before the head shot.

Views on a Scene

Above: from the south knoll.
Below: from the north end of the overpass

Above: from the middle of the overpass.
Below: from behind the picket fence.

Four views on the Presidential limousine at the moment of the head shot (as depicted in JFK: Inside the Target Car).

Views on a Scene

The sniper hired by the program, Michael Yardley, then looks at the limousine from four possible locations in the Plaza. He discusses these locations with Mack, to see which locations should be tested. They rule out the south knoll because the bullet would have to have been fired through the front windshield of the limousine. This hides in part that some researchers believe there was a hole through this windshield. They rule out the middle of the Triple Overpass for the same reason. Yardley then says the north end of the Triple Overpass is possible, but is shot down by Mack who says the shooter would have been noticed in this location. They then take a look from behind the picket fence. Although single-assassin theorists have long insisted that the limousine would be moving much too fast across the sights for someone to fire from this location, Yardley says there would be enough time to get off a shot. And it's a good thing, too, for without at least one location besides the sniper's nest to test, the program might look a little biased, even to the uninformed.

The program then cuts away to Adelaide, Australia, and depicts the creation of the simulated heads to be used in the tests. Pamela McElwain-Brown, who consulted on the program, reported later that these heads cost \$50,000 apiece.

Anyhow, something strange occurs during this sequence. A CT scan of a skull is depicted as the narrator relates that the Australian team is to make "*a target that would allow us to re-stage the assassination.*" (This scan is shown on The Death by Disco slide above). The CT scan is dated August 2008, and depicts wounds quite unlike Kennedy's words, and quite unlike the head wounds incurred by the simulated skull later in the program. What, then, does this CT scan represent? Did the creators of the program create a horribly inaccurate fake CT scan of what they believe Kennedy's head wounds actually looked like? In their previous program, Beyond the Magic Bullet, the program's creators had a CT scan performed on a simulated torso, after it had been fired upon. Is this then the CT scan of a skull fired upon but not discussed in the program?

It appears not. Towards the end of this program it is mentioned that they have an extra simulated head available if the shooter misses his target. The program then shows Yardley making the shot. On the Discovery Channel's website, however, it was later acknowledged that Yardley missed this shot, and hit the side of the simulated head, and that the shot in the program was in fact a shot on the fourth and final simulated head. Well, surprisingly, the wounds on the simulated head not shown in the program also fail to match the wounds on the CT scan shown during this sequence. So what, then, is this CT scan supposed to represent?

Leaving that aside, while the Australian simulated heads appear to be more accurate than the deliberately incomplete chest torsos used in Beyond the Magic Bullet, they are in fact quite problematic, as they are missing something vital. Blood. The program notes that simulated brain matter will be injected into the skulls at the last minute. But there is no mention of blood. A comparison of the blood spatter patterns observed during a simulated shooting and the blood spatter visible on the Z-film was at the core of my original suggestion that these tests be conducted. Blood spatter analyst Sherry Gutierrez concluded the head shot was fired from the south knoll in large part because there was no backspatter from the back of Kennedy's head visible on the Z-film. The program's failure to inject blood into the head therefore seems suspicious. Perhaps I'm being a nit-picker. Perhaps this "simulated brain matter" will react much like blood. We'll see.

At this point the program moves to yet another location. It now details the construction of a simulated car, in a simulated Dealey Plaza, on a Sylmar, California shooting range. Ironically, the program stresses that the measurements of the wooden "car" have been taken from schematics of the President's limousine--the same schematics ignored when the producers sought to demonstrate the single-bullet theory in Beyond the Magic Bullet. A simulated Kennedy torso with a simulated head attached at the top of a "*rigid, crash-test dummy neck,*" is then placed in the car in a reasonably accurate re-creation of Kennedy's position in Z-312 of the Zapruder film.

Next, Michael Yardley fires at the first of the heads shot in the program. He fires this shot from the simulated grassy knoll position behind the picket fence. For this shot he uses a Winchester rifle and soft-nosed hunting ammunition, the ammunition the program claims would most likely be used by a professional assassin. The head is blown to pieces. Completely destroyed.

He then shoots at a second head using a Mannlicher-Carcano rifle like the one purportedly owned by Oswald, firing full-metal jacket ammunition, ammunition similar to that found in the limousine. This shot exits the left side of the head, on a trajectory suggesting that, if such a bullet had been fired from this location on 11-22-63, it would have hit First Lady Jacqueline Kennedy.

Or so the creators of the program would have us believe...

Sleight of Jackie

The program later brags about its accuracy, and layers Z-312 onto its mock-up of the target car (as seen below).

In Inside the Target Car, it is proposed that a shot from the picket fence needs testing because the Moorman photo taken just after the head shot captured something in this location. Mrs. Kennedy's head is in front of her husband in this photo (as seen at left).

Thirty seconds later, however, they show the view from the fence when looking at actors purportedly replicating Z-312, taken only 1/6th of a second before the Moorman photo. Mrs. Kennedy is now depicted with her head behind her husband (as seen above).

This layering of Z-312 proves Mrs. Kennedy was in front of her husband and not behind and that the program's earlier claim that a bullet fired from the fence "would have passed through John Kennedy and hit Jackie Kennedy, killing her as well" is untrue.

Nine seconds later, however, it shows the image at right while proclaiming that a shot from the fence is inconsistent with "film records."

Is this an "innocent" mistake?

Sleight of Jackie

A close look at frame 312, later projected onto the mock target car fired upon in the program, shows Mrs. Kennedy to be slightly forward and left of her husband, looking at his face, and out of line with a shot coming from his right front. So where does the program get off claiming a bullet fired from the picket fence would have hit her?

Only nine seconds after showing its viewers 312, moreover, and claiming *"Our team has exactly re-created a forensic moment in history,"* the program shows an image of the re-enactors shown earlier in the program, layered onto an image of the Kennedy shooting dummy as seen from the picket fence location used by Yardley. This layered image depicts Mrs. Kennedy behind her husband, in direct line for a shot fired from the fence.. At this point the narrator relates *"Our first two tests from the grassy knoll show both debris and damage inconsistent with autopsy and film records."* By *"film records"* the program seems to be asserting that the Zapruder film demonstrates Mrs. Kennedy to be behind the President, and that the re-enactors therefore got it right. But only nine seconds earlier, the program had proved this to be untrue! This is utterly baffling. Could this really be an innocent mistake? I mean, shouldn't at least one person working on the program have caught such an obvious mistake?

When asked about this later on the Discovery Channel's website, Gary Mack insisted that, unbelievable as it may seem, that it was in fact an innocent mistake. When it was pointed out to him that Jackie was

not behind her husband, but was in front of him, he readily admitted: *"She wasn't and we didn't catch it at the time. At the moment of the fatal shot, Jackie's head was in front of JFK, whereas our actor's head was behind him. However, that error had no bearing on the purpose of the recreation in Dallas. The only actor who needed to be seated correctly was JFK, and he was perfectly placed. After all, we were only trying to show whether or not a sharpshooter could see his target -- Kennedy -- from the various locations."*

Mack's answer raises more questions, however. While he is correct to state that the improper placement of the Jackie substitute in the limousine during the segment filmed in Dealey Plaza had little impact on Yardley's conclusions about which shots seemed likely, he sidesteps that the program later used its incorrect positioning of Mrs. Kennedy to discount that a shot was fired from the picket fence. It seems hard to believe he has forgotten this not-so-minor detail.

Particularly in that he was the one who did the discounting. After the shot in question was fired, Mack, Yardley, and the creator of the simulated heads, Wesley Fisk, ran over to the mock car and looked at the damage to the left side of the skull. At this point, Mack stated "Then there would have been a dead Jackie right here." This leads the narrator to proclaim: *"Our test shows that the bullet would have passed through John Kennedy and hit Jackie, killing her as well. In addition, our test shows massive damage to the left side of the skull, an area undamaged in the official autopsy report."* Yardley then asks Mack *"We may have just proven that there wasn't a gunman on the grassy knoll--what do you think?"* To which Mack replies: *"That's the way it looks."*

So, Mack wasn't telling the truth and nothing but the truth when he responded as though the incorrect placement of Jackie in the re-enactment was immaterial to the program's conclusions. It was, in fact, central to its conclusions. Even worse, Mack was chiefly responsible for this error. He was responsible for aligning the re-enactors in the target car. And he was the one who blurted out on camera that the bullet exiting the head would have killed Jackie.

Either this was an embarrassing mistake from someone who certainly ought to have known better, or Mack was part of a deliberate charade designed to fool the millions viewing the program. That he would later admit this mistake really doesn't tell us all that much. After all, in my exchanges with Dale Myers I got him to admit that his animation as depicted in *Beyond the Magic Bullet* was distorted and deceptive. Of the millions who've viewed *Beyond the Magic Bullet*, how many do you think are aware of this fact? Or will ever be aware of this fact?

Similarly, of the millions viewing *Inside the Target Car*, how many will ever find out that its creators screwed up and placed Jackie behind JFK instead of to his front? And that Mack admitted as much?

(In 2009, *Inside the Target Car* was re-broadcast, apparently with some minor changes. According to Pamela McElwain-Brown, who watched this re-broadcast. the program's creators corrected an error about the timing of the photos taken of the Presidential limousine, and inserted a different photo of the Jack and Jackie stand-ins into the Sylmar shooting sequence. She said that this made the program's incorrect placement of Jack and Jackie less obvious. When I asked her if they had also removed the offending sequence of Mack incorrectly claiming a grassy knoll shot would have killed Jackie, she reported that they had not. If this is so, then the suspicion that Mack's admitted mistake was not an accident but a deliberately scripted part of a deliberately deceptive program...would appear to have been confirmed.)

Notes from the Sylmar Knoll

In JFK: Inside the Target Car, shots were fired on a simulated skull from a simulated grassy knoll in a simulated Dealey Plaza in Sylmar, California. The simulated skull ripped open upon impact (as seen in the images above).

Above: Sixth Floor Museum Curator Gary Mack inspects the left side of the simulated head.

Unfortunately for some conspiracy theorists, this simulation showed that a full-metal jacket bullet, if shot from this location, would most probably exit the left side of Kennedy's head (as seen in the image at right).

Unfortunately for single-assassin theorists, it also demonstrated that backscatter would explode from the entrance location and that skull fractures and scalp lacerations would most probably be longer at entrance than at exit (as seen in the images at left and above). This flies in the face of the "official" story.

Notes from the Sylmar Knoll

Still, if the program's creators were being deliberately deceptive about the likelihood a shot was fired from behind the fence, it wasn't because they had to be. There are plenty of legitimate reasons to doubt a shot was fired from this location. Whether or not a shot from the knoll would have hit Mrs. Kennedy, no exit wound was observed on the left side of her husband's head, and no damage was observed on the left side of his brain. Also problematic is that those closest to this location did not hear a shot fired from its direction. Nearby witnesses who thought the shots came from the knoll, such as William Newman and Abraham Zapruder, felt they came from somewhere to the east of the fence. Of course, Mack has already discounted the value of the eyewitness evidence, so the program's failure to make this last point is not all that surprising.

What is surprising, however, is that the program's tests from this location leave so much unanswered. While the program's creators were open-minded about what rifle may have been used to fire from this location, for some unexplained reason they did not extend this open-mindedness to ammunition. Yes, the identifiable bullet fragments found in the car were full-metal jacketed ammunition. But they were fragments of Mannlicher-Carcano ammunition, and the program has already conceded that evidence was lost during the clean-up of the limousine. There is therefore no reason for them to fire a Winchester rifle from this location, knowing that its ammunition didn't match, and not also fire other kinds of weapons whose ammunition didn't match. They could have tested soft-nosed reduced-charge

ammunition, which would have exploded the head to a lesser degree than the soft-nosed hunting ammunition they'd used, but would not have exited from the left side of the head. But they did not. Instead they tested an ammunition they'd already declared would not have been used by a professional assassin--full metal jacketed ammunition--from a location where no one has proposed such ammunition was fired.

It's actually worse than that. Not only did the program's creators test the wrong kind of ammunition from this location, they failed to note the significance of the tests they did perform. The shot hit the near side of the head, and exited the far side of the head. It hit no bones in between. The bullet was fired at a closer range and thus traveling faster than the bullet believed to have killed Kennedy. And yet the top of the head did not explode like Kennedy's. This is damaging to former HSCA wound ballistics expert and single-assassin theorist Larry Sturdivan's contention that the top of Kennedy's head exploded as a result of the expansion of a temporary cavity created within his skull. If these simulated skulls are so similar to human skulls, why didn't this skull explode? The soft-nosed bullet fired from this location exploded the skull to a greater extent than one would expect on a human skull. So why did the second bullet not send fragments from the top of the simulated head skywards?

There are other problems as well. While, as one might expect, the exit hole on the left side of the skull was larger than the entrance hole on the right, the simulated scalp lacerations and apparent fractures were larger at entrance than at exit. Upon the bullet's impact, moreover, material flew back from this entrance. The program should have asked why a small entrance with small fractures was found on the back of Kennedy's head and a huge hole with huge fractures was found on the top of his head, and why, as near as can be determined from the Zapruder film, no backspatter shot back out this entrance.

Of course, programs like this are not in the business of asking such questions.

There Won't Be Blood

The climax of the Discovery Channel's 2008 production JFK: Inside the Target Car came when shooter Michael Yardley fired on a simulated skull from a simulated sniper's nest, using the type of rifle and ammunition purportedly used by Oswald. He hit the skull near the "cowlick" entrance...and the top of the simulated skull flew skywards (as shown above).

Rather than report the obvious--that firing on the entrance location preferred by the HSCA failed to reproduce the President's head wounds, and that it created instead one large "gutter" wound (as seen above)--the program's producers reported that the explosion of brain matter was similar to the explosion of brain matter seen in Kennedy's limousine, and that they'd therefore proved the head shot was fired from behind. But where was the blood?

There Won't Be Blood

After satisfying themselves that the head shot wasn't fired from the knoll, the programs' creators then proceeded to perform what was obviously designed to be the centerpiece of the program: the re-creation of the President's head wounds by a shot fired from the sniper's nest. For this shot, Yardley used a Mannlicher-Carcano rifle similar to the purported assassin's rifle, and the appropriate ammunition. He fired at the "cowlick" entrance, which, according to Gary Mack, was based on the autopsy photos and x-rays, *"something the Warren Commission did not have in 1964."*

Well, hold it right there. Mack conceals from the program's viewers that Chief Justice Earl Warren later admitted that he DID look at the autopsy photos, and REFUSED to let the autopsy doctors look at them in order to accurately depict the President's wounds in their drawings. He also conceals that the autopsy doctors later looked at these photos, and, not once but twice, reported that the photos confirmed that the entrance wound was where they originally said it was, 4 inches lower than Mack now claims. He conceals as well that the doctors, after having been confronted with the photo purported to show the "cowlick" entrance, insisted that the red mark in the photo was nothing but dried blood. In short, he hides all the serious questions about the head wound entrance location discussed in chapter 13 of this webpage by pretending that the questions can be answered by the simple proposition that the Warren Commission did not have the autopsy photos and x-rays in 1964. Mack's comment is an insult to

serious researchers, and is an obvious attempt to lull those unaware of the problems with the medical evidence back to sleep. (Note to self: this program is selling certainty, not doubt!)

So, anyhow, Yardley fires. Although it was later admitted that he missed on this attempt and hit the side of the simulated head, the program inserts instead his shot on the fourth and final simulated head. He hits the cowlick entrance... And blows the top of the simulated head off!

There is no small entrance leading to an extremely large exit as was supposedly observed on Kennedy... There is just one large gutter wound... Just as I'd predicted in chapter 15 of my webpage years before this program was filmed...

At this point, the program is at a crossroads. It can continue on its road to deliberate deceptionville or it can make the right turn and admit they were surprised by the result of their test. The program's creators can admit that their test suggests that perhaps just perhaps the entrance wound on the back of the skull was not as determined by a secret panel years after the fact and then confirmed by close colleagues to the members of this panel years after the fact, but was actually where the doctors who actually saw the body said it was, or they can ignore their own test and pretend that nothing the least surprising transpired.

Well, not surprisingly, considering they ran the stoplight at a similar crossroads in *Beyond the Magic Bullet*, they race right through the intersection. The program does not mention that the bullet impacting on the back of Kennedy's head supposedly made a small entrance, and traveled several inches through his skull before exploding outwards. It makes no mention that the wound they've created is one large gutter wound.

There is something else that is not mentioned, nor explained. There is also no backspatter visible on the film of this headshot. Nor is there any forward spatter. While the program's creators have placed a large fan blowing wind measured at 25 mph in front of the limousine, in order to better reproduce the conditions in Dealey Plaza on 11-22-63, they have obviously not done so in order to compare the size and shape of the blood spatter erupting from Kennedy's head with the size and shape of the blood erupting from their simulated skull. There is no simulated blood erupting from the simulated skull, just green goo simulating brain matter.

As the study of blood spatter is a highly-respected field of forensic science, and a comparison of the blood spatter in a simulation with frame 313 of the Zapruder film might prove most enlightening, it's hard to understand why there was no simulated blood injected into the skull to go along with this simulated brain matter. Perhaps the producers knew they would fail, so failed to even try. Or perhaps they simply thought that green goo would look better on camera.

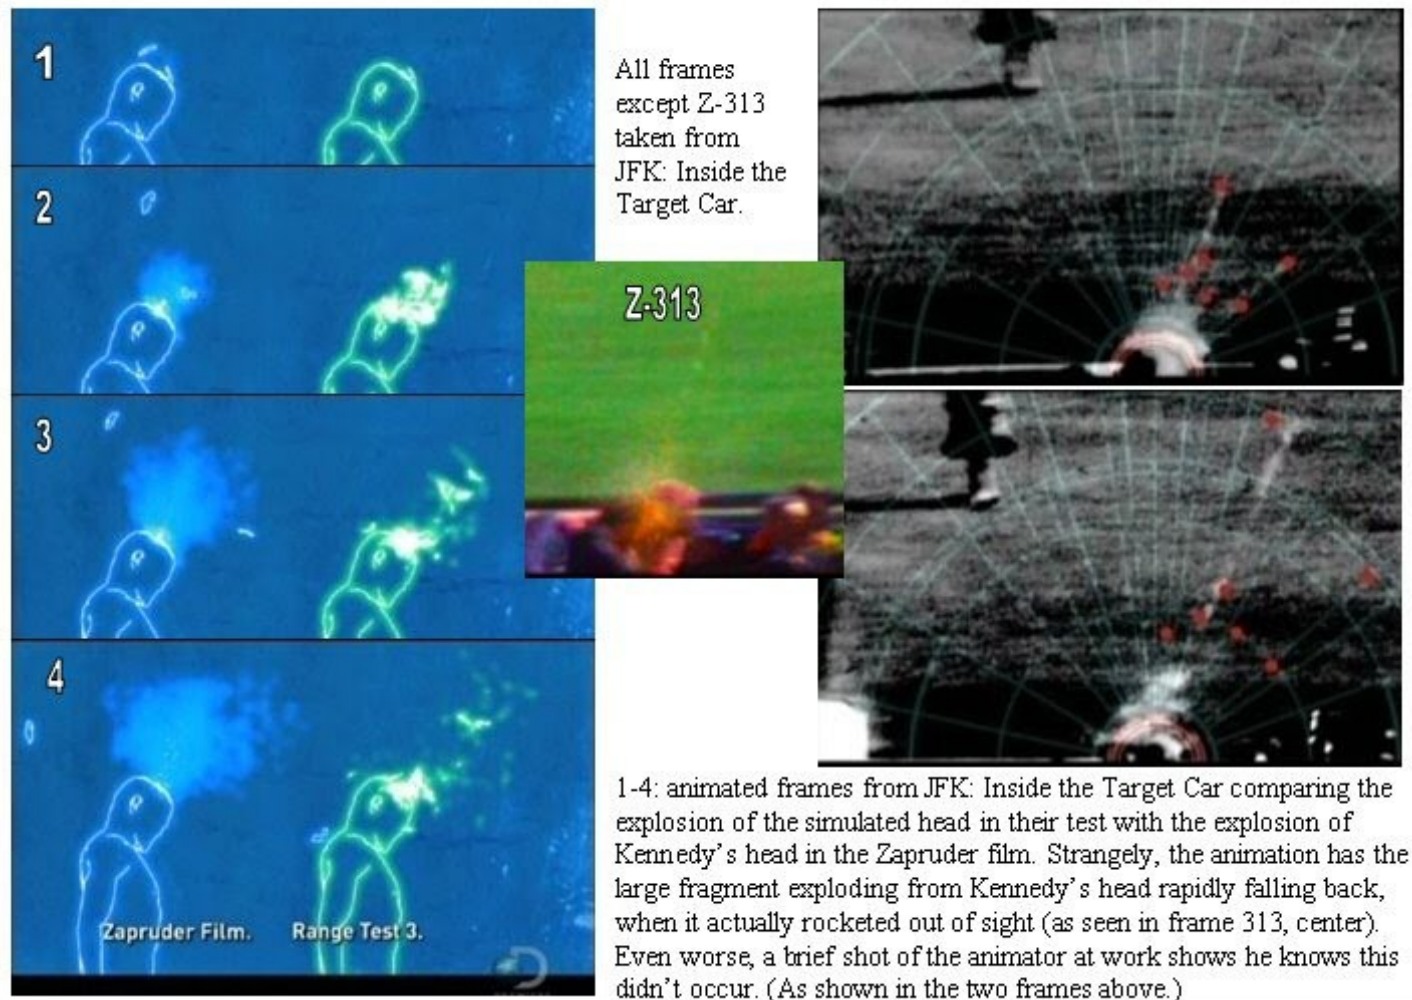

In his subsequent discussion on the Discovery Channel's website, Gary Mack admitted as much. He related: *"We did not want to use red, since that would have been rather gross to watch. And we couldn't use a clear liquid since that wouldn't show up on camera. For best visibility on television, we used bold colors that were easy to see. The HD version of the show has clearer images than the regular TV version."*

O.K., Gary, that almost makes sense.

At another point in his online discussion, when asked about the shot to the cowlick's failure to replicate Kennedy's wounds, however, Mack proclaimed: *"Although our test shot struck very, very close to the actual bullet entry hole, no such test can be absolutely exact. What's more important is the effect of the bullet and whether or not the blood spatter matches the film of the actual shooting or not."*

Well, if this is so, then why not use a liquid that sprays back out of bullet holes, and leaves mist in the air upon the explosion of a skull? Something that remotely resembles...blood.

Flight of Fantasy

Flight of Fantasy

We now enter the spin cycle of the program. 100%. The centerpiece of the program--an attempt to replicate Kennedy's head wounds with a shot fired from the sniper's nest--failed to re-produce Kennedy's head wounds. And not only that, it called into question the most recent conclusions about the entrance location of the bullet. How do the producers then spin this to fit their already demonstrated agenda--that of supporting the "official" story?

Well, they start by re-showing the film in slow motion, and discussing similarities between the shooting they've observed and the shooting of Kennedy. Of a large piece of simulated skull flying backwards from the head, they relate: *"A large chunk moves backwards and lands on the trunk, just like the large piece that Jackie may have retrieved."* This *"may"* is most revealing. While a piece of skull and/or brain matter landing on the trunk of the limousine has long been used by conspiracy theorists to suggest the head shot was fired from in front of the President, many single-assassin theorists still dispute this. The program's use of *"may"*, then, seems designed not to offend these folk, and is used even though Secret Service Agent Clint Hill, who was jumping onto the trunk of the limousine at the time, insists he saw Mrs. Kennedy pick something up, and even though Mrs. Connally insisted she heard her scream "I

have his brains in my hands", and even though one of the doctors at Parkland Hospital working on Kennedy, Dr. Marion Jenkins, insisted she'd handed him the brains. Well, why are the creators of a supposedly independent program so worried about upsetting the relatively few single-assassin theorists in denial on this point, when they seem completely unconcerned about upsetting the numerous conspiracy theorists convinced a special ammunition was used for the shot from the knoll?

In any event the program moves on to consult with forensic scientists and criminalists, who study the brain spatter in the car and conclude the shot was fired from behind. They also use a laser to align the bullet's entrance on the simulated dashboard with a trajectory through the head and conclude the bullet was fired from the simulated sniper's nest. Well, this is interesting. There was but one bullet entrance on the dashboard. This indicates the bullet exited in one piece. This is yet another way in which the program's head shot simulation differed from the shooting of Kennedy. The bullet striking Kennedy exploded into numerous pieces. More than half of it was never located.

Later, when asked on the Discovery Channel's website if the bullets fragmented, Gary Mack admitted *"No, and that was quite a surprise. Carcano bullets are military, metal jacketed bullets designed not to fragment upon impact. Oswald's did, but ours did not. We do not know why that happened."* Well, bravo Gary. A straight and honest answer, without spin. Nice.

The program's creators then show photos of the green goo spatter in the simulated car to limousine witnesses McLain and McNairy, and they, not surprisingly, agree that the spatter patterns look like what they saw in the limousine outside Parkland Hospital on 11-22-63. While this is clearly supposed to be dramatic, it is in fact far from it. It was 45 years ago. How accurate can their recollections be? But more to the point, why weren't they shown photos of goo from when the skull was shot from the knoll? They may very well have said that those photos look just like what they saw in '63 as well. It seems apparent from this that, while these witnesses are no doubt well-intentioned, the program's creators have used them much as they've used Nellie Connally and Bobby Hargis. Their credibility has been borrowed, but is not questioned or fully put on display. They are in the program to help sell its creators' hypothesis and that is all.

Even so, the program makes a mistake in this stretch. It tells its viewers that photos were taken of the limousine on the night of the assassination while in the White House garage. The color photos shown, however, were taken the next afternoon. This was first pointed out by Pamela McElwain-Brown in an online critique of the program. Ironically, Ms. Brown is an expert on the limousine, and was given a special thanks in the program's closing credits.

But that's leaping ahead. The program isn't over. The narrator announces that they still need to compare their film of a bullet's impact on a simulated skull with the impact seen in the Zapruder film. He then offers that *"There is a difference between documenting an experiment and showing the death of a human being. For this reason we've translated the graphic portions into a digital facsimile. This allows us to directly compare the data in a way that blunts the horrific impact and respects the memory of a beloved President."*

With this, I prepare for the worst. Historically, from the inaccurate medical drawings prepared for the Warren Commission to the deceptive animation of the shooting shown on TV, most every time someone tells us that they are creating an accurate facsimile to replace something we can look at for ourselves, they misrepresent the evidence.

And this time is no different. The *"test footage reduced to similar data points"* as the Zapruder film depicts an explosion of brain upwards and forwards. It also shows a skull fragment fall backwards. The animated head explosion taken from the Zapruder film, on the other hand, shows a mist explode from the skull--not gobs of goo--and a skull fragment explode slightly upwards, and then fall backwards. Although the narrator proclaims these animations match "almost exactly", there are in fact, huge

problems with this animation, and with this claim. First, the fragment in the Z-film comes from the top of Kennedy's head, when the fragment in the test footage comes from the back of the head. Not an insignificant difference. Second, the limousine was moving during the filming of the Zapruder film, and it seems unlikely the animation takes into account that the bloody cloud erupting from Kennedy's head started to erupt when Kennedy was inches behind where he appears in the film. Third, the explosion of skull in the Z-film heads both upwards and downwards, while the explosion in the animation goes strictly upwards. And fourth, and most importantly, THE ZAPRUDER FILM DOES NOT SHOW A FRAGMENT EXPLODE SLIGHTLY UPWARDS AND THEN FALL TO THE TRUNK OF THE CAR.

Even worse, the program's creators KNOW the Zapruder film does not show this. When discussing the creation of their "*digital facsimile*" they showed an animator at work, with frames from the Zapruder film on his computer monitor. Upon these frames red marks had been added to designate fragments exploding forwards and upwards from the impact location on the President's head. Not one of these fragments behaves like the large fragment in their "*digital facsimile*". Even more surprising, not one of the fragments designated by these marks is even depicted in the "facsimile".

This suggests that the program's creators started to do a legitimate analysis of the skull explosion, only to realize it didn't back up their pre-ordained conclusion that their tests supported the official story. It seems likely then that they decided to pretend that it did, and decided to "sell" that it did via their shoddy cartoon. One of the unique aspects of Kennedy's death, and therefore one of the clues as to what actually happened, is the explosion skyward of a large bone fragment at frame 313 of the Zapruder film. This fragment is almost certainly the bone fragment discovered the next day by Billy Harper at a location approximately 80 feet away from the impact location, as this is the largest bone fragment found outside the limo, and must have traveled there somehow. The program's failure to discuss this fragment, and its pretending that the fragment seen at frame 313 fell to the back, and was, by implication, the object picked up by Jackie Kennedy from the trunk of the limousine, is shockingly bold, and suggestive that its creators shared a naked desire to deceive. I have no other way to say it--I think these guys are liars.

They are, after all, the same guys behind Beyond the Magic Bullet, an equally deceptive program. They have, after all, ignored in this program that their shot from the knoll using full-metal jacketed ammunition created wounds quite different than those reportedly found on Kennedy. They have, after all, ignored in this program that their shot from the sniper's nest also failed to replicate his wounds, and that the explosion of the skull from this shot suggested that, at the very least, the bullet impacted at a different location than that fired upon. They have, after all, created a cartoon in this program that is a blatantly false depiction of the impact on Kennedy, and have claimed that they created this deceptive cartoon out of respect to the President's memory.

(To be clear, I don't believe the program's producers are "liars" in the sense that they know Kennedy was killed by a conspiracy and are part of some conspiracy to convince people otherwise. That would suggest a level of knowledge that is probably beyond their grasp. No, I mean "liars" in the sense that they are interested in pushing a specific scenario, and deliberately shade every bit of information to support that scenario, even if it means misrepresenting the evidence to support their previously agreed-upon conclusions. In this behavior, admittedly, they are not dissimilar to many conspiracy theorists. There is a significant difference, however. The difference is that most conspiracy theorists are honest enough to say they believe Kennedy was killed by a conspiracy, before presenting the reasons why. The Discovery Channel programs, on the other hand, pretend they have no agenda, and have come to no conclusions beforehand, and that it's just an incredible coincidence that everything they push forth supports the single-assassin scenario, EVEN WHEN IT DOESN'T.)

The program then concludes "*The Warren Commission was correct--the fatal shot did not come from*

the grassy knoll." Gary Mack then relates that the shot came from behind, *"apparently from the sixth floor window."* It closes with Mack looking out this window. While I tend to agree with this conclusion, the road getting there was so filled with dust and deception that it leaves me feeling numb.

The Flight of the Harper Fragment

Above: a comparison of three frames from an outtake of JFK: Inside the Target Car with frame 313 of the Zapruder film. The light blue lines demonstrate the locations of the largest skull fragment in each frame. This "mistake" more closely resembles the explosion of skull seen in the Z-313 than the take used in the program, and was the real re-enactment.

The Flight of the Harper Fragment

A few days after I thought I'd finished this summary and review, however, I saw something that snapped me to my senses. No, I didn't re-appraise what was in the program itself. I remain convinced it was deliberately deceptive. What I saw was a discussion by Gary Mack of the program on the Discovery Channel's own website, the discussion referred to in the added sections above. When asked what became of the footage of the extra skull mentioned in the program, Mack replied: *"The 'cutting room floor,' as they say, removed for time and clarity by Discovery. Their decision was reasonable, as there wasn't enough time to include everything. The show's producers and I very much wanted the scene to be shown; for that reason, it will be included in the DVD release of the show. But you can also see it below, as posted to YouTube or you click the hyperlink to see it on the Discovery Channel News*

site. For that shot, fired from behind, Michael missed the spot on the skull slightly, resulting in damage on the right side of the skull. Nevertheless, the blood spray pattern was very similar to the second attempt from our Depository window."

Well, I immediately watched the footage to judge this last claim for myself, and developed a whole new appreciation for the Discovery Channel. This outtake was by far the most significant part of the program, and the most damaging to the official story otherwise propped up by the program. The fact that someone, anyone, affiliated with the program thought this footage worthwhile, and endeavored to make it available to the curious, and the more-than curious, suggests that not everyone affiliated with the program had an absolute disregard for the truth.

You see, this footage confirmed one of my most important conclusions about the shooting. It showed that a bullet impacting on the side of Kennedy's head from behind would dislodge a large skull fragment and send it soaring through the sky at an almost identical angle to the large fragment seen soaring through the sky in Z-313. This footage much more closely resembled Z-313 than the shot used in the program.

The Cloud of Mist

Four frames from the tests performed for the Discovery Channel compared with Z-313. The frames at far left, from the outtake, display the same downward explosion seen in Z-313. The frames above and below, which are taken from the show itself, do not.

The Cloud of Mist

The resurrected re-enactment footage showed more than just a fragment sailing skywards, however. It showed also that an impact at this location would create an explosion of skull and brain heading both upwards and downwards. The explosion of skull used in the program did not do this; the simulated brain matter from that skull exploded upwards and then fell downwards. Zapruder frame 313 was taken within .03 seconds or so of the bullet's impact, too short a time for the bloody matter below the bullet's exit and out in front of Kennedy's face to have exploded upwards and to then have fallen downwards.

This resurrected footage also showed a cloudy white mist, apparently caused by the bullet's tangential entry on the skull. No such mist was observed on the footage used in the program, where the bullet entered straight into the back of the skull and exited straight from the front of the skull. Such a mist is seen above the top of Kennedy's head in Z-313, however. This suggests that the tangential entry on Kennedy's skull was more to the top of his skull than the tangential wound was on the simulated skull in the Discovery Channel's footage. Having a wound in this location is also consistent with Zapruder film, autopsy photos and x-rays.

The Missing Piece

Above: HSCA Figure 28, a photo of the Harper fragment, sized relative to the simulated skull at left. Intriguingly, it nearly fits the triangular defect above the bullet's path.

At right: a drawing by Dr. Lawrence Angel, placing the Harper fragment on the skull. Addendum E to the report of the Forensic Pathology Panel.

Above and below: the tangential wound created by the "missed" shot cut from Inside the Target Car. The blue arrow reflects the path of the bullet.

What would the wound at left have looked like if the bullet had hit one inch forwards and one inch higher on the skull, in the location marked with an X? Would it have blown the top of the simulated head off, starting just above the ear, and look like the large head wound on Kennedy? Would the bullet have created a groove across the upper right quadrant of the brain, as it reportedly did on Kennedy? I believe so.

The Missing Piece

Once one realizes that the flight of the Harper fragment in Z-313 closely resembles the flight of the fragment in the resurrected re-enactment, and the explosion of skull in Z-313 closely resembles the explosion of skull seen in the resurrected re-enactment, naturally, one begins to wonder what else can be tested, what else can be compared.

This led me to wonder if the Discovery program's creators had bothered to find and film the fragments that had exploded from their simulated heads, if only just to see, y'know, what these fragments looked like. I wondered if any of these fragments resembled the Harper fragment, the only fragment from Kennedy's skull found outside the limousine and subsequently photographed.

While we all grow old (or, in some cases, even older) waiting for this footage to surface, however, we must satisfy ourselves with what is already apparent. And that is this: the missing piece of the simulated skull just above the bullet's path, the apparent source of the largest fragment observed exploding upwards in the resurrected footage, is sharply triangular, and closely resembles the size and shape of the Harper fragment, believed to be the largest fragment exploding upwards in the Zapruder film. The flight path, size, and shape of the Harper fragment are therefore all consistent with its being dislodged by a bullet striking Kennedy on the side of his head, just as proposed in the previous chapter.

When one looks closely at this simulated wound, moreover, it is quite easy to imagine the destruction the bullet creating this wound would have caused if it had hit the skull just a bit higher and more forward. It would have, clearly in my opinion, created a large wound quite like the wound described by both Dr. Clark in Dallas on the day of the assassination and Dr. Humes in his report the next day.

I don't believe this is a coincidence. In earlier chapters of this online book, I'd concluded that a shot impacting low on the skull and traversing the skull without hitting any bones before exiting, such as a shot striking the near the EOP and exiting from near the coronal suture, would be likely to create a large entrance on the skull, with large fractures, and an even larger exit, with smaller fractures. The Discovery Channel's shot from the picket fence with a full-metal jacketed bullet, hitting near the temple, created just such a wound. In earlier chapters, I'd also concluded that a full-metal jacketed bullet fired from the sniper's nest and hitting Kennedy at the so-called "cowlick" entry on the back of his head, would blow the top of his head off. The Discovery Channel's replication of this shot did precisely that. And finally, in earlier chapters I'd concluded that a full-metal jacketed bullet striking Kennedy near his right temple, if fired from the sniper's nest and hitting him at Z-313, would be likely to send a large skull fragment upwards, blow out the right side of his head, and leave a large tangential wound. The Discovery Channel's footage on the cutting room floor shows that, yes indeed, such a shot would both re-create the skull explosion seen in Z-313, and the large head wound reported by the doctors.

As a result, I suspect that the Discovery Channel's re-enactments are the missing piece that will finally force those interested in such matters to finally sit up and take notice.

Perchance to dream.

Perry for the Defense

On 12-03-08, in an online critique of Pamela McElwain-Brown's complaints about JFK: Inside the Target Car, Gary Mack's close associate Dave Perry defended the program. In this critique, subsequently posted on the alt.assassination.JFK newsgroup, Perry, who portrayed Secret Service agent Roy Kellerman in the program's wildly inaccurate re-creation of frame 312, not only failed to acknowledge his own role in the program, but that he'd played a more substantive role in previous programs on the assassination made by the same production team. While this may have been a simple over-sight, Perry's closing statements revealed a serious under-sight, or blindness.

Perry's conclusions (with my own comments added):

- *"What the Discovery Channel producers attempted to do was to scientifically test a couple of theories and present the results of those theories. When other scientists or researchers dispute a theory they form a research group and do their own testing. If their results contradict what was proposed they make their findings public to counter the original theory."* (This sounds reasonable. The problem is that JFK: Inside the Target Car failed to test the conspiracy theories as usually proposed, and not only misrepresented them to the public in order to shoot them down, but shot them down for fraudulent reasons.)
- *"If the Discovery Channel's findings can be refuted then most likely a competing network or organization would be more than happy to air the results. To those who complain about the cost of such a venture that argument is not valid. I know of at least two individuals who have spent hundreds of thousands of dollars to promote their own pet theory as to who the shooter was as opposed to attempting to show how the assassination took place."* (This just is not true. "Competing networks" have NEVER made it their business to refute the findings of reality-based programs on other networks. There is, in fact, a professional courtesy at work, in that, no one working at network A is likely to embarrass those working at network B, for fear that come next year they will be working at network B, or for someone who used to work at network B. I personally have met network executives who won't even TOUCH on a controversial subject covered by a "competing network," for fear they will look like they are "following the other network's lead." Perry's criticism of those spending "hundreds of thousands of dollars to promote their own pet theory" about the shooter, without "attempting to show how the assassination took place" is equally nonsensical, and pre-supposes that determining exactly how the shooting took place is more important than figuring out who performed the shooting--a prioritization not remotely accepted by the FBI, Warren Commission, HSCA or any other body to investigate Kennedy's assassination. The FBI, after all, decided Oswald pulled the trigger without figuring out if it was even possible for him to have fired all the shots. The Warren Commission, for their part, found Oswald to be the lone assassin while simultaneously concluding there was insufficient evidence to decide just how many shots were fired, let alone which ones hit.)
- *"If a new proposal appears even remotely to have merit then competitors will rush to air it. This is exactly what happened when Nigel Turner made his pitch, with little proof of his and other "researchers" accusations, to the History Channel. His new programs aired in 2003 as the latest installment of The Men Who Killed Kennedy series."* (This is more nonsense. Nigel Turner was allowed to create more programs because his earlier programs had made a lot of money for the network. After his last program accused President Johnson of masterminding Kennedy's death, however, the outcry from mainstream historians and political figures became a threat to the network's survival, and the network decided creating conspiracy-oriented programs was more trouble than it was worth. Since that time--over five years now--not a single cable channel--the same channels pumping out dozens if not hundreds of programs on UFO's, vampires, monsters, and ghosts--will touch anything on the Kennedy assassination that remotely suggests government complicity in the killing of the President. Perry most certainly knows this.)
- *"Ms. Brown and those who disagree with the results of JFK: Inside the Target Car or any of the other Discovery Channel's programs concerning the assassination should stop fault-finding and begin their own scientific testing. Let them refute the theories presented. And when doing so they should use facts as opposed to misrepresentation."* (This again sounds reasonable. This ignores, however, that the problems with the programs stem not so much from the results of their tests, but from the SPIN given the results of their tests. It is difficult to conceive that any channel currently in existence is gonna finance a replication of the Discovery Channel's tests

just so someone can come on and say "Oh yeah, by the way, this same test was performed for the Discovery Channel but that program's creators deceived you about the true significance of their results." I, for one, don't see it happening anytime soon. Probably not in our lifetime...)

Mack's Me-a Culpa

On August 14, 2009, researcher Paul May, using the name Spiffyone, posted an email from Gary Mack in which Mack attempted to explain some of the mistakes in the program. Mack's response is as follows:

JFK: Inside the Target Car first aired nine months ago and with all the whining about our Jackie actor being in the wrong position, no one has bothered to ask how it happened until today. You're the first!

The short answer is miscommunication between the producer and our spotter in the car. The young woman is a local actor; though I don't remember her name. My friend, David Perry, portrayed Secret Service agent Roy Kellerman and Dave's responsibility was to make sure the limo, the Kennedys and the Connallys were positioned appropriately. Those Dealey Plaza scenes were merely illustrative so viewers would have an understanding of who sat where and how the limo may have affected assassins' views.

Initially, the program was going to test several shooter locations including some test shots into a real 1961 Lincoln limousine and through its windshield. But the producer had to fly the skull replicas and their two builders to a California shooting range from Australia, and since the heads were very expensive, the production budget quickly became a significant expense.

Unfortunately, two major problems forced a change in the show's direction. First, production researchers failed to find any available operating or junked 1961 Lincoln Continental limousines or windshields. Without either, Target Car had no target, since it was extremely important to have a real 1961 Lincoln windshield. Next, the National Archives declined to shoot new video of the actual JFK windshield or to fully open its container. Without access (their understandable concern was for the safety and preservation of the windshield), we were unable to test the windshield shot theory.

Producer Robert Erickson, with whom I had worked on earlier shows, asked me what to do instead. My answer was simple: concentrate only on the head shot by duplicating the official version of the shooting and the most likely second gunman theory, then compare the results to the Zapruder film. My approach, which would have revealed any significant inconsistencies, was accepted just days before the Dallas scenes were scheduled to be filmed.

Nevertheless, when filming began, we hoped to at least show some of the earlier Z frame views if we had the time. And just as explained and shown in the program, I helped our Kennedy actors assume their Z-312/313 positions. Then, because the producer, photographer and I were going to be standing far from the car, Dave was to make sure the actors were properly seated and posed. Both Dave and Robert Erickson had radiophones to communicate which frame was being filmed. He and the other actors had reference paper prints of each Zapruder frame we hoped to examine.

Here's where events interfered and got us off track. We filmed all day late into the evening in 100+ degree heat at Love Field, an abandoned building taking the place of Parkland Hospital's emergency entrance, and Dallas Executive Airport taking the place of the White House garage. Hardly any of those scenes made the final program. The next day, forecast to again exceed 100, was Dealey Plaza with Nick Ciacelli's replica limousine, which we had shipped from Michigan to Dallas.

After the explanatory scene in front of the old Depository building, Robert, sharpshooter Michael Yardley and I prepared to restage some of the possible assassination scenarios. The city of Dallas and

Dallas Police would only allow Dealey Plaza to be closed for five minutes at a time, so we had to set up quickly, roll tape, then move the car out of the way while we walked to the next sniper location. We were behind schedule even before testing the first shooting theory from the south knoll, so we decided to only duplicate the head shot.

Robert was going to notify Dave of our decision, but somehow failed to do so. His subsequent messages to Dave referred only to getting the limousine and JFK parked over the X on Elm, but not on how the Kennedy actors were supposed to pose. Somewhere along the way, our Jackie actor, despite having been in the right position at the beginning of the day, got mixed up and put her head behind, instead of in front of, JFK. And without hearing from Robert about Zapruder frames or the actors, Dave didn't say anything to the actors.

By the time we did the knoll recreation, we were all sunburned and exhausted. As we started setting up, I heard Robert Groden speaking with Robert Erickson about something or other. I was working with the cameraman and didn't pay any attention at first. Groden, who was kind enough to move his table selling books and videos behind the wall near the Zapruder pedestal, was not involved with the production in any way. Nevertheless, he tried to help by telling Erickson we were doing it all wrong. Erickson put up with him for awhile, then referred Groden to me. All I heard was that JFK's head wasn't exactly right; I heard nothing about Jackie. I thanked him and quickly explained that JFK was close enough for what we were doing in the Plaza. Groden, of course, knew nothing about us planning to fire test shots at replica skulls a week or two later. We continued filming and finished, exhausted, near sundown.

So why didn't any of us see the problem? The answer is quite simple: we were too far away. Only our photographer, looking through his camera lens, had a good view of the car, but he wasn't knowledgeable about the assassination. Robert Erickson and I were at the ends of the Plaza for all but the knoll shot and neither of us could see the actors clearly. We relied on Dave, but Dave was relying on us. It was a classic case of a failure to communicate.

So by the time we recreated Z312/313, the actor placement error just didn't register with me. In fact, I initially stationed the cameraman a few feet away from the correct fence test location I had selected (which was, of course, the spot where the acoustics evidence placed a gunman). Eventually, I realized the problem and we had to reshoot putting us even further behind schedule.

Following the actual test shots at a gun range in Sylmar, California which were extremely accurate and over the following weeks, Robert Erickson and the folks at Creative Differences started putting the show together. He sent me a DVD of a rough cut and I was astonished at the Jackie error, but there was absolutely nothing we could do about it. There were no outtakes at that location showing her in the right pose and we had to include at least one closeup to illustrate JFK's position. We simply had no alternative.

In the movies, you'll find the term Continuity somewhere in the end credits. That's the person or persons who make certain everything in one scene precisely matches what appears in the next. For example, if an actor holds a cigarette in his right hand it had better be in that same hand when the camera cuts to a different angle. Other than me, we didn't have a Continuity person in Dealey Plaza and I missed the mistake. Simple as that.

Those who don't like the results of the test have been harping on the Jackie error as if it completely ruined the shooting test. They are wrong. They do that because they cannot dispute the simple science behind our basic premise: bullet goes in, matter comes out, and how does that compare to the Zapruder film? The results were convincing.

Gary Mack

Okay, so things were chaotic. And there was a communication error. And the actors were filmed in the wrong position at the wrong location. But this STILL does not explain why after the firing of the knoll shot in the program Mack himself insisted the shot would have killed Jackie. If they had simply filmed the actors in the wrong position, as claimed, and he would have caught this mistake should he have been watching the actors through the camera, as claimed, well then why did HE use this "mistake" to debunk that a shot came from the knoll? And why, if he caught this mistake before the program was completed, as claimed, did they include both the shot of the actors in the wrong position and his comments based upon this mistake in the final program? Because they didn't have an alternate shot of the actors? Really? Then why, according to those viewing repeats of the program, was an alternate shot of the actors added back in? And why, since the REAL problem wasn't the shot of Jackie's stand-in in the wrong position, but Mack's claiming her being in this position destroys the theory a shot came from the knoll, wasn't THIS more substantive mistake corrected for subsequent showings of the program?

And, perhaps more importantly, if the comparison of the simulated sniper's nest shot in the program to the actual shot in the Zapruder film was so central to the "basic premise" of the show, as claimed by Mack, why did they forego comparing their shot to the Zapruder film itself, but instead compare it to a ridiculously inaccurate cartoon purportedly based upon the Zapruder film?

With this self-serving me-a culpa I'm afraid Mack has only dug himself a deeper hole.

Chapter 17: Newer Views on the Same Scene

Dental Dilemma

HSCA Authenticity Report Figure 7:
pre-mortem x-ray of President
Kennedy's teeth. Image inverted.

What lies hidden behind the metal "markers" at right?

Figure 10: teeth and jaw cropped from autopsy x-ray 2.

Figure 11: teeth and jaw cropped from autopsy x-ray 3.

Figure 11: teeth and jaw cropped from autopsy x-ray 3.

Dental Dilemma

Having satisfied myself that the bullet striking Kennedy at frame 313 of the Zapruder film struck him at the supposed exit on the right side of his head, I was forced to grapple with the mystery of what happened to the bullet I'd previously concluded had struck him low on the back of his head. At this point, I remembered something that had always struck me as strange: the jaw bones and teeth on Kennedy's skull x-rays had been cropped off the photos of the x-rays published by the house committee. This, in turn, led me to wonder if a bullet hadn't lodged in Kennedy's jaw, perhaps obscured in part by his teeth. I thought of an early report written from the notes of the Parkland doctors in which it was claimed that "Considerable quantities of blood were present in the President's oral pharynx" (mouth) before it was suctioned. Since Kennedy's throat wound was described as slowly oozing blood, I wondered if the blood in the back of his mouth might not better be explained by a bullet's having lodged in his jaw.

When I read the HSCA testimony of Dr Lowell Levine, a dentist hired to confirm that the teeth in the x-rays supported the authenticity of the x-rays, my own jaw hit the floor. He said: "There is a radio opaque rectangular object with three small and one large radiolucent circular areas in it extending from the second lower premolar considerably beyond the third molar area. It obliterates the roots of the molars and extends at an angle beyond the inferior border of the mandible." "It obliterates the roots of

the molars?” Could this be the missing bullet? I grew even more suspicious after re-reading the testimony of Dr. Michael Baden and finding a note which read: “In deciding to release the autopsy x-rays the committee wished to permit public examination of the most important details of evidentiary significance while still maintaining a sense of propriety. In accordance with this desire, the committee decided to display the autopsy x-rays to the public in a cropped fashion.” I double-checked this against Baden’s 1989 book *Unnatural Death*, and here he told a different story: “The family balked at having x-rays of the head published in our final report. That distinctive Kennedy jaw was the source of some anguish—it looked too much like him, they said. We compromised. In the published report, the lower part of the jaw, showing the teeth, is blocked out.” This made me even more suspicious—who asked for the jaws to be blacked out, the committee or the family? And if showing the teeth was verboten, why was Dr. Lowell Levine allowed to show them in his testimony moments before Baden took the stand with his blacked-out jaws? I looked at these x-rays and couldn’t figure out what the metal was, but was suspicious that whatever it was it was used to cover up a bullet lodged in Kennedy’s jaw. I re-read the HSCA interview of the autopsy radiologist Dr John Ebersole and found the following exchange: “Baden: what is this long rectangular object at the lower portion of the x-rays of the head? Ebersole: “It is a rectangular object. It looks as if it could be used as a measuring device, yes.”

A measuring device! In my attempt to solve the murder of the century, I almost claimed there was a mass cover-up of a measuring device! I found further testimony explaining the presence of this device. Ebersole’s radiology assistant Edward Reed told the ARRB on 10-21-97 that “I suggested at that time that we take a small metallic fragment for magnification purposes and put it—attach it to the side of the head closest to the film...I did that. Put the—taped it to the back part of the mastoid on the left.” He continued: “This marker is a piece of aluminum with a small hole in the middle, in the distal third. As soon as I saw that, I recognized that is the piece of metal that I put on the left side of the President’s skull...For magnification purposes...we made them out of lead markers. They’re not straight. We use a scissors to cut them out of lead sheets.” A week later Ebersole’s other assistant Jerrol Custer talked to the ARRB and claimed all the credit for himself: “I had my—my own little measuring device on it...They had like little holes in it; and you could see the—it would either elongate, or you’d see a little dot.” When shown the x-rays he identified “My marker in the lower mandibular joint...Actually, all it is, is a metal—piece of metal, about half a centimeter thickness. Less than that. And about two inches long with numerous dots going left to right.” When asked if it was a standard device, he said “That was my device,” and that Ebersole “saw it that night, and he knew it belonged to me.” He said that Ebersole told him “I better not see it on those films,” and that, when he tried to put it on the abdomen x-ray, Ebersole “saw it, and made me take it off.” So there you have it. No conspiracy. Merely an over-eager underling interfering with the search for a bullet.

The EOP Entry Revisited

Autopsy Face Sheet:
Boswell's arrow shows the bullet
headed to the left and up.

Zapruder frame 225: Kennedy appears to
be sitting straight up, facing Zapruder.

Possible scenario. Bullet
descending 25 degrees through
the air. Entrance into skull,
diving under the cerebellum.
Deflection down the neck.
Deflection off transverse
process of spine at C-7.
Exit of bullet once again
descending at 25 degrees.

25 degree angle to
left as at Z-312

Fox Autopsy Photo: close-up
of entrance shows the bullet
headed to the left and down.

Overview at left reveals
how the bullet would have
to have curved into the skull in
order to have avoided the spine.

The EOP Entry Revisited

So where did the bullet entering the occipital bone go? When one looks closely at the entrance near the EOP (the external occipital protuberance—the bony prominence low on the back of men's skulls at the approximate height of the middle of the ear), one finds a possible answer. For a close look at the tunneling from right to left will show that the bullet went *down*.

This is a bit perplexing. While Dr. Boswell marked the entrance on the head on the autopsy face sheet with an arrow pointing upwards and to the left, which would seem to rule out such a trajectory, further analysis reveals that we can't trust this arrow. Outside of the fact that the doctors believed the large defect to have been an exit, and that it was above the entrance on the skull, they offered us no other reason to believe the bullet was traveling upwards upon entrance. While Dr. Boswell described the entrance as "ragged, slanting," moreover, his drawing indicates the entrance was ragged and slanting to the left, which makes no sense seeing as the bullet's exit was on the right side of the skull, and no damage was noted on the left side of the brain. There's just no getting around that Boswell's arrow was in error. While it was officially in error by pointing to the left, our interpretation of this photo suggests that it was actually in error by pointing up.

When one considers that the entrance seen in the autopsy photos, and reported by Dr. Finck as a "transversal" wound, was supposedly created by the impact of a bullet at frame 313, when Kennedy was leaning sharply to his left, it becomes even more apparent that Boswell's arrow just can not be trusted. A transversal wound on the back of a head that is tilted to its left, if caused by a weapon firing from the right of the victim, would be an indication that the bullet headed downwards upon impact. It just defies belief that a high-speed bullet heading right to left and downwards on the back of the skull

would reverse course to such a degree that it would travel left to right and upwards within the brain.

This forces us to examine other scenarios. If the bullet headed downwards upon impact at the back of the skull, and continued downwards within the skull, it would most logically have entered the neck. But do bullets impacting on the skull ever descend down the neck, or is this just something that sounds good in cyberspace to a layman such as myself? According to *Gunshot Injuries*, one of the first books on the subject, written by Louis Anatole La Garde at the height of World War I, a projectile creating a penetrating skull wound, where there is an entrance but no apparent exit, is "generally lodged within the skull unless it has, as sometimes happens, passed down the neck."

That little obstacle taken care of, let's see where this conjecture takes us.

1. Well, first of all, since we've already concluded the bullet striking Kennedy at frame 313 most likely struck him on a tangent, we can venture that the bullet creating the small entrance wound on the back of his head struck him at some other time.
2. Since we've already decided that a bullet entering Kennedy's back at the location of his back wound could not have continued on to bruise his lung and exit his throat without hitting his spine, the throat wound is unaccounted for. We can only wonder then, if the bullet heading down into the neck at a time other than 313 made its exit from Kennedy's throat.
3. Since Kennedy reaches for his throat just after Connally appears to get injured, around frame Z-224, moreover, we should consider the possibility that a bullet traversed down Kennedy's neck at this time.
4. As Connally was sure a shot was fired before he was hit, and as he appears to be hit at Z-224, we can assume that Kennedy most probably received his back wound shortly before this time, most likely around frame 190, when the HSCA concluded a shot striking Kennedy was fired.
5. As the time span between Z-190 and Z-224 was less than two seconds, too short an interval for Oswald to have accurately fired his bolt-action rifle, we can conclude that the proposed bullet impacting in the occipital region of Kennedy's skull around frame 224 need not have been created by Oswald's rifle, and need not have been fired from the sniper's nest. As discussed in our review of the eyewitness statements, in chapters 5 through 9 of this study, moreover, there was only one shot heard between Z-190 and Z-224. This suggests as well that one of the shots was noise-suppressed, quite possibly through the use of subsonic ammunition.
6. There are still other indications that the projectile exiting Kennedy's throat was moving at a subsonic speed. Beyond the discussions of wound ballistics included in the Single Bullet "Fact" chapter, which show that a high-speed bullet traversing Kennedy's neck as proposed in the single-bullet theory would be expected to cause far more damage than reported, there is the 5-13-64 Warren Commission testimony of the FBI's ballistics expert, Robert Frazier, in which he described the presumed exit points of the bullet on Kennedy's shirt and tie. Frazier told the Commission: "The hole in the front of the shirt does not have the round characteristic shape caused by a round bullet entering cloth. It is an irregular slit. It could have been caused by a round bullet, however, since the cloth could have torn in a long slitlike way as the bullet passed through it. But that is not specifically characteristic of a bullethole to the extent that you could say it was to the exclusion of being a piece of bone or some other type of projectile." When asked by Commissioner Dulles if this slit could have been caused by the bullet's tumbling, moreover, Frazier once again responded in a less-than-supportive manner: "I think the effect in the front of the shirt is due more to the strength of the material being more in the horizontal rather than the vertical direction which caused the cloth to tear vertically rather than due to a change in the shape or size of the bullet or projectile." When then asked if the slowing of the bullet's velocity within Kennedy's neck could have been a factor in the bullet's creating slits and not holes, he responded, finally, in a way that revealed his true thoughts: "I think the hole would not have been affected unless it

was a *very large change* in velocity." (Forensic science texts in general and 2005's Forensic Pathology: Principles and Practice in particular confirm that a slit-like exit wound is indicative that the exiting bullet had been traveling at a low velocity. While this is specific to the exit on the skin, it would appear that, based on Frazier's testimony, it is also applicable to an exit on clothing.)

7. If a subsonic bullet was used it helps explain the bullet's trajectory, as well as the relatively light damage observed in the neck, and the slit-like exits on the shirt. In Management of Gunshot Wounds, Dr. Gary Ordog writes: "Low-velocity missiles are relatively unstable compared with high-velocity missiles... The instability is noted in the fact that low-velocity bullets tend to follow tissue planes, and often do not follow a straight line from entrance..." If the second rifle proposed was, as suggested by the statements of the eyewitnesses, fired from the Dal-Tex Building, its bullet would impact on Kennedy at frame 224 on a 25 degree descent, slightly steeper than a bullet from the sniper's nest. It might then dive under Kennedy's cerebellum on its way to his neck. This correlates the bullet entrance apparent in the mystery photo, and described by the autopsy doctors, with the reported lack of damage to the brain, better than any other theory yet offered.

8. The presumption Kennedy was struck by a subsonic bullet in the back of the head, circa Z-224, also helps explain why no one noted an impact on the back of Kennedy's head before the fatal explosion at Z-313. The backspatter of a subsonic bullet impacting on the back of the head, to be sure, would be far less obvious than the expected explosion at entry of a high-velocity round. The tunneling on the skull before entrance presumed for this bullet, moreover, would be more suggestive of a low velocity round than a high velocity round, and would, along with Kennedy's scalp and hair, almost certainly weaken the explosion of blood from the entrance.

9. Let us remember as well that Connally's first instinct was that an automatic weapon had been fired. A second low-speed bullet's striking Connally, intriguingly, could help explain the route of the bullet in his chest, which supposedly followed the curvature of the chest wall. While it would be unlikely for such a bullet to continue on to damage his wrist to the extent it was damaged, perhaps there was yet a third bullet fired in this subsonic burst that struck Connally in his wrist.

Let us move forward, then, under the acceptance that such a possibility is not unreasonable on its face, and that it answers the questions of the medical evidence better than any other theory. (Should one be wondering what happened to this bullet or bullets, let us also remember that some sort of clean-up occurred in the limousine, and that no real investigation was done of the limousine beyond what the Secret Service sworn to protect President Johnson told us and what the FBI saw on the night of the assassination, hours after the limousine was illegally removed from Dallas.)

But does the Zapruder film support that the shot or shots at Z-224 came from the Dal-Tex Building? When one studies Z-225, the first frame in which Kennedy's fully visible after his disappearance behind the Stemmons Freeway sign, one can't help but notice that Kennedy's looking almost straight at Zapruder, approximately 50 degrees to his right. If one were to use this position to rear project the position of a likely shooter, a la Canning, one would be forced to conclude the shooter was on Houston Street, on the top of the County Records Building, or the jail.

But there's another factor to be considered. And that factor is the curve bullets make when they enter a curved part of the skull. According to Spitz and Fisher's Medicolegal Investigation of Death, "if the bullet strikes the head at a shallow angle or in an area of significant curvature, at least some deflection of the bullet's trajectory may be expected." According to Aarabi and Levy's Missile Wounds to the Head and Neck, "if a bullet is fired at an angle or hits a curved portion of the skull, deflection will usually result." According to Larry Sturdivan: "Though all the Biophysics lab test shots were aimed so that the WC's specified entry and exit locations would lie on a straight trajectory, none of the bullets penetrated the front of the skull at the "intended" exit location. One even punched out through the right

orbit (eye socket) near the nose.” These statements indicate that the trajectory of a bullet hitting Kennedy from behind while his head was turned would be likely to curve upon entry. This is in keeping with the curve required for a bullet entering the skull by the EOP and heading down the neck to avoid the spine. When you ponder this it makes sense—when you push the corner of a shopping cart into a pole its wheels turn towards the pole. The side that meets the most resistance slows down and spins the side meeting less resistance to face the resistance, like a tank. This characteristic of bullets is noted on many of the websites of gun enthusiasts. On the Single Action Shooting Society website, for instance, one such enthusiast discussed an experiment he and some friends from a SWAT team had conducted on some windshields in a junkyard. They found that: “All rounds deflected up if shot from inside and down from outside the car. If shot from outside at a 45 degree angle the rounds all turned back toward the shooter and down...The .22 LR when fired from inside straight on to the 45 degree windshield deflected so much we could not get a hit on a target at hood distance.”

So then we have to ask ourselves if there’s any evidence for such a deflection. It’s one thing to say it could have happened but another thing entirely to say it probably happened. When one considers that the skull at the side of the EOP is slanted downwards, and that a bullet hitting this slant from the right and from above might be deflected downwards, and that the rightmost section of the wound in the hairline in the mystery photo appears to represent only the upper right corner of the entrance, one should conclude that such a deflection is likely.

Once one considers that Kennedy was both turned to his right around 50 degrees at Z-224, and that the bullet entering his occipital bone must have come in from his right in order to leave such a mark on his skull, one can approximate the most likely location of the rifle. If we take the extreme case we can say that the bullet angled in from the school book depository. But the most likely origin of a bullet coming in from the right and entering Kennedy’s skull at frame 224 would appear to be the Dal-Tex Building.

Still, this kind of thinking--taking an entrance without an exit and a possible exit without an entrance and matching them up, and then building a case upon it--is exactly what got Dr. Humes into trouble. For fear of pulling a Humes then and incorrectly connecting the leftover wounds, let’s take a step back and see if we can find any real evidence a bullet descended in Kennedy’s neck.

Mirage Analysis

Z-304, cropped and lightened

Z-308, cropped and lightened

Z-312, cropped and lightened

Could the small entrance near the EOP actually be visible in the Zapruder film?

Mirage Analysis

When I first realized that a bullet entering near the EOP could have gone down the neck, I was at a loss as how to prove this to myself. It then occurred to me that if I studied the Zapruder film I might be able to spot evidence for the EOP entry *before* the head shot at Z-312. I looked and looked for signs of blood on Kennedy's collar, to no avail. In retrospect, this makes sense, because if this wound had led to a large loss of blood, surely someone in Dallas would have seen it.

I then switched tactics and focused on watching the exact spot where the wound is visible on the autopsy photos. I noticed basically nothing until frame Z-308, when there was suddenly a dark oval in the area. I looked for a corroborating frame, and found a similar dark shape in the location at Z-312.

Excited, I decided to show these frames to a friend, but when we looked at the frames on his wide-screen TV, we just saw dark shadows. I decided I was guilty of seeing a mirage. I wanted to see something so bad, that I saw it. Later on, while watching the Zapruder film on my ancient TV, I noticed the dark shapes again, and realized I couldn't see them on the other TV because it had a different level of contrast than my old antique.

In November, 2005, I uploaded the digitized versions of these frames to my computer, and attempted to increase the contrast to bring out the dark shapes. I found that by using Adobe Photoshop and lightening the shadows, the shapes I first saw on my ancient TV became readily apparent.

In March, 2006, I went back and inspected every frame of the Zapruder film between 280 and 312, and

lightened the shadows on the clearest frames. I found numerous dark blobs on the back of Kennedy's head in every frame. This undercut any relevance I could attach to any one frame. When I continued my inspection, however, I realized that these dark blobs jumped around from frame to frame. As the dark blob by the hairline re-appeared multiple times, and in a constant relation to Kennedy's ear, I continue to suspect there is indeed a dark shape apparent in Kennedy's hairline, and that it is quite likely a bullet wound.

Hopefully, someone with a better understanding of movie cameras and film will run a series of "blob" tests and determine if the camera was capable of picking up a small wound surrounded by hair at the distance Zapruder was from Kennedy, and whether one can attribute any meaning whatsoever to a recurrent blob on a dark area of a film. It could very well be that the blob I saw on TV was just a mirage.

Re-Thinking Mr. Wilson

In a 1995 episode of *The Men Who Killed Kennedy*, photo analyst Tom Wilson discussed the Zapruder frame at left. He claimed the colorized image inserted at left and below, which separated out the various shades of brown in the dark patch on the back of Kennedy's head, demonstrated that there was a large hole on the back of the head. He said further that the dark dot in the image—the one above the pencil point--was the bullet path through the exposed brain.

While few students of the assassination have ever taken Wilson's interpretations seriously—his analysis of Kennedy in the Moorman photo was equally outrageous — no one has ever challenged that the images used in his analysis were legitimate high-contrast images of the photos he was studying.

So what was the black dot in the image at left? Could it be the entrance on the back of Kennedy's head?

If not, are we to assume it's just a coincidence that it lines up with the entrance described at autopsy?

Re-Thinking Mr. Wilson

In 2008, while watching a 1995 episode of *The Men Who Killed Kennedy*, I realized that tests similar to the ones I've proposed have already been conducted. Researcher Tom Wilson, who had a scientific background impressive enough to get him access to the autopsy materials—one of only a handful of conspiracy theorists to receive that honor--knew that cameras could record more shades of gray than

could be noticed with the human eye. This got him thinking. What would we find if we used digital technology to expand the contrast of the shades seen in images of the assassination? What would we find inside the shadows?

While virtually no one, including this researcher, would agree with Mr. Wilson's interpretations of what he found inside these shadows, it is nevertheless interesting that, when inspecting the shadows on the back of Kennedy's head in the Zapruder film, Mr. Wilson came across a dark dot at the approximate location of the bullet entrance described at autopsy. Having convinced himself that one shadow-shape represented a hole on the back of Kennedy's head, and that another shadow-shape represented the brain inside the skull, however, he convinced himself that this dark dot represented the bullet's passage through Kennedy's brain. While this, of course, is silly, as a bullet exploding Kennedy's skull like it exploded in frame 313 would not leave a nice round hole in the brain that could be photographed from a hundred feet away, the actual finding of a dark dot in the location depicted in the program suggests a bullet entered low on the head by the EOP. Apparently, Mr. Wilson was unaware of its possible significance.

Mr. Wilson died in 2001. If anyone knows the whereabouts of his images, and if he performed tests on the Zapruder frames just before the head shot, please let me know.

Similarly, if anyone knows if the methodology used by Wilson to create his images has been as discredited as his interpretations of the images, please let me know.

Base Fracture?

But all blobs and dots aside, if a bullet striking Kennedy's skull exited from his neck at a time prior to the head shot at frame 313, there should be some signs that this occurred. To begin with, the bullet would have to have made an exit on the base of his skull. But there's no evidence for this exit. Or is there?

Although Dr. Humes told the ARRB that “We looked with care at the whole interior surface of the skull to see if there were any other defects what have you. There were no others,” a thorough reading of his testimony and a close look at the skull base visible on the open cranium photograph give one reason to doubt he thoroughly inspected the *base* of the skull.

One online article on a proper dissection of the skull and brain notes that, after the brain is removed: “if any intracranial hemorrhage is present the blood is collected and measured. The dura is pulled out from the floor of the skull by holding it with a piece of cotton or gauze...The base of the skull and rest of the cranial cavity is examined for fractures and tested for any abnormal mobility. The fracture of anterior cranial fossa manifests itself by escape of blood and cerebrospinal fluid from the nose, and middle cranial fossa by escape of blood and cerebrospinal fluid from the ear. Since fracture of the posterior cranial fossa and ring fracture are followed by escape of blood and cerebrospinal fluid in the tissues of the neck, they may not be suspected in certain cases and would be missed unless dura is pulled out from the floor of the skull and the posterior cranial fossa carefully examined.”

And this is not some newfangled procedure. The Autopsy Manual for Dr. Finck's employer, The Armed Forces Institute of Pathology, has long noted "For demonstration of fractures the dura should be stripped from the bone. This is best done by winding it onto a hemostat attached to the cut edge of the dura. Some pathologists prefer to use "gas pliers." In either case the dura should be stripped immediately after the brain is removed..."

The open cranium or mystery photograph proves these procedures were not followed. There is dura around the foramen, and what appears to be coagulated blood surrounding the Foramen Magnum. It is perhaps not an oversight, then, that when Dr. Humes told the ARRB that the doctors inspected the skull and found nothing unusual, he failed to reveal whether the dura was pulled out or the blood was drained. The blood was most certainly not measured. Humes, when describing a missing photo the doctors believe was taken of the inside of the skull, did tell the ARRB, however, that the photo “should have been sharp and clear because there was no blood by that time, you see. The brain had been removed, and it was a through and through hole...” While this could be taken as an indication the dura was removed and the blood cleaned up, Humes’ next statement to the ARRB might be even more revelatory. When asked by Jeremy Gunn “were there any fractures in that portion of the skull,” Humes replied “Well yeah, I guess... there were fractures in the posterior cranial fossa radiating from the wound.” This latter recollection, moreover, is supported by the recollections of Kennedy's mortician, Tom Robinson, who told the HSCA in 1977 that "The inside of the skull was badly smashed..." and who, according to notes taken by Doug Horne, told the ARRB in 1996 "there were fractures all over the cranium, including the floor of the skull."

The Clark Panel’s interpretation of the x-rays specifically ruled this out. Their report declared: “Also, although the fractures of the calvarium extend to the left of the midline and into the anterior and middle fossa of the skull, no bony defect, such as one created by a projectile either entering or leaving the head, is seen in the calvarium to the left of the midline or in the base of the skull.” As there were no x-rays taken from what is known as the Towne’s view, which specifically targets the occipital bone, however, they were most certainly over-stating their case. According to Outline of Roentgen Analysis, a 1943 text contemporary with the x-ray equipment used at Bethesda, “Almost all fractures of the vault of the skull are demonstrable on careful x-ray examination. *Fractures of the base, however, may frequently be invisible owing to the complicated structure, the inability to put the patient in the proper position for visualization of the base, and to the superimposition of bones.*” According to a more current text, Radiology of the Skull and Brain “Many fractures of the calvarium extend into the base but frequently they are not identified on roentgenograms” (x-rays). Thus, the x-rays taken of Kennedy's skull would be of little help in establishing that there'd been no exit on the base.

On the other hand, the x-rays of the neck could suggest the *possibility* there'd been such an exit.

According to Power et al in the March 2004 American Journal of Roentgenology, "Air has been shown on both radiography and CT within the cervical spinal canal after skull base trauma." This same article states "The presence of air within the subarachnoid space should alert the clinician to the likely presence of a dural tear." This suggests that, if a bullet were to have exited from the base of Kennedy's skull, air would most likely have been apparent in the subarachnoid space. So was air apparent in Kennedy's subarachnoid space?

Yes, it was. HSCA Radiologist Dr. David Davis reported: "There is some air in the subarachnoid space of the spinal canal, and also apparently in the...middle fossa... but since the fracture is open to the subarachnoid space, this is not at all surprising."

So, the possibility the bullet exited the base can't be ruled out. But are there any other signs?

Reading the Signs

Let's return to Radiology of the Skull and Brain. It states "*Basal skull fractures are common...but frequently are not appreciated on routine skull radiography. They can be suspected clinically because of 1, blood behind the tympanic membrane of the ear in the absence of direct trauma to the ear, 2, subcutaneous hemorrhage over the mastoid process (Battle's Sign), or 3, extensive ecchymoses about the orbits in the absence of direct trauma to the orbits.*" While the ecchymoses (bruising) about the orbits (eye sockets) of President Kennedy were indeed noted at the autopsy, the other two signs were not mentioned. When one looks at the photographs taken of the back of Kennedy's head, however, and compares it to a photograph of someone with Battle's Sign, one can see that he did indeed display this tell-tale sign of a fracture in the base of his skull. The black and white photograph, moreover, seems to be an attempt, in part, to depict this sign, as it appears some blood has been wiped from the area behind Kennedy's ear that was apparent in the nearly identical color photo taken moments before.

A chapter by Dr. Jefferson Browder in Brock's *Injuries of the Brain and Spinal Cord* is also revealing: *"a bloody discharge from the external auditory canal may result from a traumatic laceration of this canal, a rupture of the tympanic membrane alone, or a compound fracture of the skull into the middle ear..."* There was indeed a lot of blood in Kennedy's right ear. When one compares it to Kennedy's left ear, it seems likely this blood did indeed come from the ear. Since it was acknowledged even by the Clark Panel that the middle fossa was fractured, however, this provides little proof that the posterior cranial fossa was fractured.

When we look back at the online description of an autopsy, however, we see that *"The fracture of anterior cranial fossa manifests itself by escape of blood and cerebrospinal fluid from the nose, and middle cranial fossa by escape of blood and cerebrospinal fluid from the ear. Since fracture of the posterior cranial fossa and ring fracture are followed by escape of blood and cerebrospinal fluid in the tissues of the neck, they may not be suspected in certain cases and would be missed unless dura is pulled out from the floor of the skull and the posterior cranial fossa carefully examined."* This tells us that excess blood in the neck tissues could be an indication the posterior cranial fossa was fractured, perhaps even that a bullet traveled down the neck. In the HSCA report by Drs. Kerley and Snow, who compared the autopsy photographs to one another to show that the photographs were of the same man and that that man was Kennedy, it was noted, when discussing the back of the head photos *"There is a 3 by 5 centimeter area of discoloration at the base of the neck in the right area that apparently represents either a slight contusion or some postmortem lividity."* A close look at the right lateral autopsy photo does indeed show bruising at a point on the neck which would appear to be higher than the purported passage of the bullet between the back and throat. Could this bruising have come as a result of a bullet's traveling down the neck?

Intriguingly, the doctors in Dallas who first saw Kennedy, and who were only aware of his throat wound and large head wound, discussed a possible trajectory between these wounds, and had little problem assuming a bullet or fragment traveled up or down his neck. In his initial report, Dr. Robert McClelland even described the throat wound as a *"fragment wound,"* implying it was caused by the exit of a fragment from the bullet creating the head wound. (This, we should recall, became the stance of the FBI in the days and weeks after the assassination; the FBI was so successful in spreading this take on the President's wounds, moreover, that newspapers such as the New York Times and magazines such as U.S. News were still repeating that a fragment descended within his neck months afterward.)

In any event, one might assume from the Parkland doctors' suspicion a bullet traveled up or down the neck that they observed some signs which told them such a passage was likely. In Josiah Thompson's *Six Seconds in Dallas*, he outlined the Dallas doctors' testimony and accumulated these signs. Dr. Charles Baxter, observing from a distance, noted: *"There was considerable contusion of the muscles of the anterior neck."* Dr. Charles Carrico, the first to inspect the throat wound, testified: *"there was some discoloration at the lateral edge of the larynx and there appeared to be some swelling and hematoma."* Dr. Perry, for his part, noted simply that the trachea was deviated *"slightly to the left"...*a point on which Dr. McClelland expanded: the *"swelling and bleeding around the site (the exit in the throat) was to such an extent that the trachea was somewhat deviated to the left side."* As the bullet is believed to have passed medial to the anterior neck muscles, and some distance below the larynx, perhaps the deviation of the trachea and the aforementioned bruises can be best explained by a bullet's having passed down, and traumatizing, the entire right side of the neck.

There is still another sign, recently uncovered, and not as yet fully documented, that suggests the bullet came down the neck. In November 2008, Christine Jenkins, the daughter of Parkland Hospital anesthesiologist Dr. Marion Jenkins, who stood at the head of Kennedy's stretcher throughout his treatment on 11-22-63, performed a one-woman show on the assassination. At the centerpiece of her show was a videotape of her father discussing Kennedy's death in Emergency Room One. According to

one witness to her show, Jack White, Jenkins claimed on this tape that *"Each time he squeezed on his air bag bubbles of blood came out the brain wound."* The air tube was, of course, put into the hole in Kennedy's throat. It is impossible to understand how air would bubble out from Kennedy's cranium unless there was a passageway between Kennedy's neck and skull base. If Jenkins mentioned these bubbles to his fellow doctors, moreover, it goes a long way towards explaining why they were so ready to believe the neck wound was connected to the head wound on 11-22.

(In retrospect, however, it seems likely Jack White was mistaken. Jack was 81 at the time. Jenkins told the Warren Commission *"As the resuscitative maneuvers were begun, such as 'chest cardiac massage,' there was with each compression of the sternum, a gush of blood from the skull wound, which indicated there was massive vascular damage in the skull and the brain, as well as brain tissue damage."* It seems likely, then, that Jack misunderstood Jenkins, and thought the bubbles of blood from the brain wound were related to the air tube, and not the chest massage performed by Dr. Perry.)

Dr. Cyril Wecht has also had thoughts that a bullet traveled up or down the neck. According to Vincent Bugliosi in *Reclaiming History*, Wecht had briefly come to speculate that a bullet had entered Kennedy's throat and exited his *"lower left occipital protuberance."* While Wecht quickly gave up on this idea, due to the incompatibility of such a bullet's trajectory with a shot from the grassy knoll, it is nevertheless important to note that a man with his experience, after viewing the autopsy materials numerous times, had seen nothing to convince him that a bullet did not travel up or down the neck, and had in fact suspected that one did travel up or down the neck.

And then there's this... In a June '67 article in *Ramparts Magazine* discussing the Garrison investigation, former FBI man William Turner wrote: *"a nurse at Parkland Hospital said that when doctors attempted a tracheotomy on the President, the damage was so great the tube pushed out the back of his head."* Obviously, if the quote attributed to the nurse was accurate, it would support that a bullet track connected the throat wound and the head wound. It might support it even if was only partially accurate. (Perhaps the nurse was inaccurately repeating Jenkins' observation about air bubbling up from the brain, or perhaps Turner was inaccurately reporting what this nurse was trying to convey.) When I contacted Turner in October 2007 to see if he could recall this interview, however, he responded *"I remember sticking it in that article but I didn't interview the nurse. I suspect it was David Welch, a Ramparts writer, with whom I made a trip to Dallas on the JFK case. He interviewed a number of witnesses separate from me...I last had contact with David Welch at a Warren Hinckle party some 15 years ago. At the time he was working for a SF union---I can't remember which one."* (I subsequently discovered, via John Kelen's book *Praise From a Future Generation*, that this *Ramparts* writer was named David Welsh, not Welch. If anyone knows the current whereabouts of David Welsh, and how I can reach him and clear up this matter, please let me know.)

But are there any other signs?

The Final Moments

Z-230

Z-237

Z-246

Z-268

Z-312

Moorman photo at Z-315

Was Kennedy inadvertently telling us something?

The Final Moments

Since a bullet shooting down the neck at Z-224 would have brushed past the cerebellum, I decided to look back through the literature to see if there was any indication something like this occurred. I found that when discussing the brain photos with the ARRB in 1996, Dr. Humes acknowledged, *"the right cerebellum has been partially disrupted, yes."* I also found that Dr. Peters, one of the President's doctors in Dallas, was shown the autopsy photos in 1988 and shared Humes' appraisal. He wrote writer Harry Livingstone that *"the cerebellum was indeed depressed on the right side compared to the left."* I then recalled the HSCA's declaration that *"the posterior-inferior portion of the cerebellum"* was *"virtually intact...It certainly does not demonstrate the degree of laceration, fragmentation, or contusion (as appears subsequently on the superior aspect of the brain) that would be expected in this location if the bullet wound of entrance were as described in the autopsy report."* This time, however, I noticed the qualifiers. They said *"virtually intact,"* which indicates some damage. They also said there was certainly not the degree of damage necessary to be consistent with the autopsy report. Well, this makes sense. The bullet trajectory suggested by the autopsy report, after all, has the bullet heading straight into the cerebellum. These statements by the HSCA Pathology Panel, then, led me to believe the damage apparent on the cerebellum is consistent with a bullet's having headed down into the neck.

Dr. Humes certainly thought so. When interviewed by the HSCA Forensic Pathology Panel on 9-16-77, and asked by Dr. Coe if he thought the *"destruction"* apparent on the underside of the brain was a *"post-mortem artifact"* from the removal of the brain, or was caused by the bullet, Humes responded *"I think it was partly caused by the bullet."*

Upon re-reading the supplementary autopsy report from 12-6-63, moreover, I noticed that there were seven slices of tissue removed from the brain for microscopic examination, including one from the *"right cerebellar cortex."* I then noticed that the other six were all from areas reported to be damaged. When I re-read the report I realized that a line I had read many times meant something completely

different than I'd previously believed. The report states "*When viewed from the basilar aspect the disruption of the right cortex is again obvious.*" As "the basilar aspect" means "underneath" and "cortex" means "outer layer," this is quite possibly a reference to the cerebellum as well as the cerebrum.

The results of the microscopic examination of the brain confirm, furthermore, that the cerebellum was damaged: "*Multiple sections from representative areas as noted above are examined. All sections are essentially similar and show extensive disruption of brain tissue with associated hemorrhage.*" Later, during his March 16, 1964 testimony before the Warren Commission, Humes confirmed yet again that the cerebellum was damaged. He noted that "*the flocculus cerebri was extensively lacerated.*" There is no flocculus cerebri. There is however, a flocculus cerebelli. It is on the underside of the cerebellum. While some researchers insist Humes meant to say the "falx cerebri," a covering of the brain, was extensively lacerated, it seems obvious that he would be much more likely to say (or have mis-recorded by a court reporter) "cerebri" instead of "cerebelli" than he would be to say (or have mis-recorded) "flocculus" instead of "falx".

There's also this. On page 159 of his book *The Death of a President*, published 1967, William Manchester reports: "*The last bullet has torn through John Kennedy's cerebellum, the lower part of his brain.*" Well, so what? Who the heck is Manchester? He could just be repeating nonsense he read in the paper. Well, this is what. Manchester's book was authorized by the Kennedy family. It was supposed to answer a lot of the questions. As a result, Manchester was given unparalleled access. Including access to doctors speaking with nobody, and I mean nobody, else. The Sources section of his book lists 5 interviews with Kennedy's physician, Dr. Burkley, between October 1964 and July 1966. Burkley inspected the autopsy photos in 1965. Did Burkley tell Manchester the cerebellum was damaged? And, if not, who did?

Inquiring minds want to know... Which brings us back to our discussion...

At the risk of pulling a Lattimer, who foolishly tried to link Kennedy's movements after first struck to something he described as a Thorburn's response, I decided to see if the President's behavior after frame 224 of the Zapruder film was consistent with that of someone suffering damage to the flocculus in particular, and the cerebellum in general. According to *Neuroscience in Medicine* (2008) "*damage to the flocculus, nodulus, and uvula result in a pronounced loss in equilibrium, including truncal ataxia...*" ("Truncal ataxia" is an "*Impairment of the ability to perform smoothly coordinated voluntary movements.*") The description continues: "*There is an inability to incorporate vestibular information with body and eye movements.*" Well, thankfully, Wisegeek.com helps put this in layman's terms: "*Damage to the flocculus can cause jerky eye movements and difficulty maintaining balance.*"

Now this is quite interesting. Kennedy appears to reach for his neck, but miss, and then lean to his left in the frames after Zapruder frame 224.

An observation by Dr. William Kemp Clark contained in Warren Commission Exhibit 392 becomes relevant at this point. When describing Kennedy's appearance upon treatment at Parkland Hospital, he noted: "*His eyes were divergent, being deviated outward; a skew deviation from the horizontal was present.*" Well, it seems more than a coincidence then that numerous scientific articles cite a correlation between damage to the flocculus and downbeat nystagmus, in which the eyes drift slowly upward, before returning to their target. *Neurological Differential Diagnosis*, 2005, goes even further, moreover, and notes both that the "*flocculo-oculomotor tract*" has "*the only direct cerebellar connection with the eye muscle nuclei*" and that "*clinical lesions and stimulation experiments*" of the cerebellum may "*result in a divergence of the eyes.*" Well, let's put it together. Damage to the flocculus can cause a divergence of the eyes.

Well, then what about damage to the cerebellum in general, as opposed to damage specific to the

flocculus? According to multiple sources, the symptoms of cerebellar damage include a weakness to the side of the body suffering the damage (ipsilateral hypotonia), a tendency to not stop a movement at its proper point (dysmetria), an inability to grasp objects (ataxia), an abnormal head attitude, and disturbances in speech, eye movement, and equilibrium. Between Zapruder frame 224, when the President seems to suffer a wound on his throat, and 313, when he is obviously hit in the head, the President reached in the direction of his throat without grabbing anything, lifted his arms past his throat, slumped to his left (perhaps as over-compensation for the sudden weakness on his right), and stared down without letting out so much as a scream. Ironically, a November 24, 1963 article in the New York Times by Dr. Howard Rusk described this very phenomenon. Mistakenly believing the theory proposed by the Dallas doctors on the afternoon of the 22nd, that one shot hit Kennedy in the throat and exploded out the back of his head, Dr. Rusk explained brain injuries as follows: *"If the injury is in the posterior portion of the brain, where the bullet that killed the President made its exit, the cerebellum is damaged. Then the individual is left with ataxia, evidenced by severe intention type of tremors that occur when one tries to perform a basic act or grasp an object. Damage to the cerebellum is also usually accompanied by a loss of equilibrium."*

Should one not be entirely satisfied with the explanation that Kennedy's strange movements were brought about by damage to his cerebellum, however, there is an additional explanation for his movements that can be added into the mix. This explanation, moreover, is equally suggestive he was struck in the skull before frame 313 of the Zapruder film. Since Brock's *Injuries of the Brain and Spinal Cord* made note that *"Posterior basilar fractures tend to gravitate towards the large foramina"*, I decided to see if there were any behavioral symptoms for a fracture in this area. And I found something which again dropped my jaw. (My jaw has been dropped so many times during this investigation that it's a wonder it hasn't been broken.) Jugular Foramen Syndrome is described by Blakiston's *Pocket Medical Dictionary* as *"Paralysis of the ipsilateral glossopharyngeal, vagus, and spinal accessory nerves, caused by a lesion involving the jugular foramen, usually a basilar skull fracture."* According to the online article *Craniofacial and Skull Base Trauma* by Dr. Harry Shahinian and the Skull Base Institute the paralysis of the vagus nerve would manifest itself through a paralysis of the vocal cords, and a paralysis of the spinal accessory nerves would manifest itself through a paralysis of the neck muscle that flexes the head (the sternocleidomastoid) as well as a weakness of the trapezius muscle, which rotates it. The result is a *"weakness in contralateral head rotation and shoulder elevation."* Contralateral, of course, means affecting the opposite side of the body. As we know all too well, Kennedy turned toward his left and dipped his left shoulder in his final silent moments.

So, yeah, I'd say there's good reason to suspect Kennedy's cerebellum and/or posterior skull was damaged even before he'd received his fatal wound.

Hurray For Horne

It seems possible, for that matter, that his brainstem was also damaged by this time. Now, admittedly, this really didn't sink in with me until 2012. While re-reading a passage in Doug Horne's *Inside the ARRB*, Vol. 3, I had the sudden feeling he was onto something, and that the brainstem was indeed injured.

Horne begins by discussing a 1969 letter written by Pierre Finck. It was written shortly after he'd testified in the trial of Clay Shaw. In this letter, Finck offered William Wegmann, one of Clay Shaw's attorneys, an explanation for the back-and-to-the-left movement of Kennedy following the head shot seen in the Zapruder film. He declared that there was a better explanation for this than that Kennedy was shot from the front. He then offered his explanation: *"due to the severance of his brain from his spinal cord as described in the autopsy report, he experienced decerebrate rigidity due to loss of*

cerebral control."

Well, this is interesting, and not because Finck was correct about decerebrate rigidity. He wasn't. No, this was interesting because the autopsy report does not specify that the brain was severed from the cord. Horne, however, identifies a passage from the report that suggests as much. Ironically, this was a passage with which I was well familiar, as I'd studied it while reaching my conclusion the cerebellum had been damaged... Horne notes that the specimen slides taken from the brain and described in the supplemental autopsy report included one taken from the *"line of transection of the spinal cord"* and that it would make no sense for the doctors to take a specimen slide from a cut they'd made themselves. He then notes that the test results for this slide, as discussed in the report, were the same as for the other slides taken from the brain. As we've seen, the report reads: *"Brain: multiple sections from representative areas as noted above are examined. All sections are essentially similar and show extensive disruption of brain tissue with associated hemorrhage. In none of the sections examined are there significant abnormalities other than those directly related to the recent trauma."*

Now this was where Horne won me over, not on the over-all point he was making, but on the specific point that the brainstem may have been damaged by the bullet. If the *"line of transection of the spinal cord"* was uninjured prior to the autopsy and the removal of Kennedy's brain, there would have been no extensive disruption or hemorrhage on this tissue sample. It would have been a clean cut, without hemorrhage. This proves the damage to the line of transection preceded Kennedy's death.

Horne, however, then cites Dr. Humes' 2-13-96 testimony for the ARRB on this issue, and concludes *"I don't know what to make of all this."*

But I do. Here is the testimony he found so confusing...

Gunn: When you removed the brain, which part of the brain did you cut in order to remove it?

Humes: The brain stem.

Gunn: Was the brain--were you able to ascertain whether the brainstem had received any damage prior to the time that you made the incision?

Humes: It was my impression that it had, yes.

Gunn: Was the brainstem already disconnected at the time that you--

Humes: No, it was not disconnected.

Gunn: How was it that you had the impression that it was--that it had received some kind of laceration or injury?

Humes: Well, one of these photographs shows you, as I tried to point out earlier, the one that was here a few minutes ago--

Gunn: The basilar view?

Humes: Yeah, the basilar view shows this disrupted-looking area right there. That's the brain stem.

Gunn: Looking at the basilar view, are you able to ascertain whether either the left or the right cerebellum has been disrupted? We touched on this issue before, but I just wanted to return to that.

Humes: In this photograph, it would appear the right cerebellum has been partially disrupted, yes.

Horne was confused, one can only assume, because he was trying to get Humes' testimony to fit his theory the body had been altered after Kennedy's death, quite possibly by Humes himself. When one looks at the supplemental autopsy Report, Finck's letter to Wegmann, and Humes' ARRB testimony in context, however, the following scenario seems probable.

1. On the night of 11-22-63, during the early stages of Kennedy's autopsy, Dr. Humes removed Kennedy's brain from his skull, and observed a disrupted-looking area of the brainstem, right by where he'd severed it from the spinal cord.

2. Dr. Finck did not witness any of this, as he had not yet arrived at the autopsy.
3. Dr. Finck was present at the supplemental examination on 12-6-63, however, when the brain was studied and photographed.
4. At the supplemental examination, Dr. Humes took a slide from the line of transection, to see if the disruption he'd observed preceded Kennedy's death.
5. As the study of this slide supported that the brainstem was damaged while Kennedy was still alive, and quite possibly by a bullet, Finck assumed that this bullet had transected the brainstem.
6. After viewing the Zapruder film, and the back-and-to-the-left movement of Kennedy after receiving his fatal head shot, moreover, Finck put two-and-two together, and concluded that the transection of the brainstem had led to Kennedy's strange movements.
7. He'd failed to appreciate that the brainstem had been disrupted, but not disconnected.

And should one think I'm conflating inaccurate statements by Humes to fit an even more inaccurate statement by Finck in order to come to a desired conclusion--that the underside of Kennedy's brain was damaged by the passage of a bullet--one should consider that they aren't the only autopsy witnesses to indicate as much.

James Curtis Jenkins, Humes' and Boswell's assistant at the autopsy, shared his recollections of the autopsy with writer Harrison Livingstone in 1990 and made a startling statement. This statement was so startling, in fact, that one would tend to disregard it as nonsense if there wasn't some support for it in the statements of Humes and Finck. As recounted in *High Treason 2*, he told Livingstone *"It wasn't necessary to surgically remove the brain from the skull. I remember Humes saying 'This brain fell out in my hands. The brainstem has been surgically cut.'"* It is, of course, hard to reconcile this purported statement by Humes with Humes' statements to the ARRB.

We can be grateful, then, that Jenkins shared his recollections with William Law in 1993, and cleared things up a little. As recounted in Law's book *In the Eye of History*, Jenkins told Law that, after expanding Kennedy's large head wound, *"Dr. Humes removed the brain, and made a kind of an exclamatory statement. I think what he said was 'The damn thing fell out in my hand.'"* Law then asked Jenkins *"What would this mean to you?"* Jenkins then admitted that he took from this that *"the brainstem had already been severed."* That the brainstem had already been severed was thus Jenkins' personal impression, and not a direct quote from Humes, as presented in *High Treason 2*.

That the underside of the brain was damaged, moreover, was not just Jenkins' impression based on Humes' statement. As it was his responsibility to prepare the brain for its subsequent inspection, he saw the brain up close, and held it in his hands. It is undoubtedly of help, then, that he told Livingstone *"The brain was there and it was intact but it was damaged. I remember it was difficult to infuse it because the circle of Willis (an H shaped circle of vessels underneath the brain) was damaged and it was difficult to get the needles in."*

Now, what are the odds Jenkins would remember such a thing, if the brain was not damaged on its underside? And what are the odds--if there really was no such damage--that his impression the brainstem was severed would match up perfectly with the claim of Dr. Finck in his letter to Wegmann, 21 years earlier? Jenkins and Finck were virtual strangers to each other. It's highly unlikely Jenkins would know of Finck's letter. Their sharing this recollection--that the brainstem was severed--makes no sense if there was no damage to the underside of the brain whatsoever, and only makes sense--seeing as Kennedy's behavior at Parkland indicated some brain activity--if his brainstem had been seriously damaged.

An early article on Kennedy's wounds becomes relevant at this time. A number of pathologists were consulted for an 11-24-63 AP article by Frank Carey. The only wounds to Kennedy known to these pathologists were a wound on the front of his throat, and another on the back of his head. They did not know, for sure, if these wounds were connected. These pathologists speculated nonetheless that *"President Kennedy's spinal cord and some vital nerve tracts at the base of his brain may have been badly damaged by the bullet that killed him...This could have caused or greatly contributed to his death...by impeding and eventually shutting off the nerve centers in the brain that control breathing and heart action."*

Their thoughts were explained in the following manner: *"if the neck wound was near the Adam's Apple, which is on the mid-line of the neck, the bullet probably struck the spinal cord...a bullet entering the body near the Adam's Apple--or leaving it at that point--could also plow into vital nerve channels at the base of the brain. These channels and centers control breathing and heart-beat action. Injury to the base of the brain--as distinguished from the top and front of the brain--constitutes an immediate threat to life. The top of the brain contains the centers of learning. Thus, while injury there can be handicapping it is not necessarily fatal. In the same way, injuries to the front of the brain, which contains the centers of personality, can alter a person's personality, but will not necessarily kill him. Reports from the Dallas hospital soon after the President's death said the President had had difficulty breathing...that he was breathing at all would rule out that the spinal cord was completely cut by the bullet...the fatal bullet or bullets most probably affected vital areas near the brain stem."*

The possible importance of their thoughts led me to seek corroboration in more recent books and articles. I found that they were correct. Current Diagnosis and Treatment in Neurology, 2006, for example, asserts that the *"proximity of the bullet to the brainstem"* is associated with a *"higher mortality."* But I also found that the brainstem can be damaged by the passage of a bullet elsewhere in the skull. Missile Wounds of the Head and Neck, Volume 1, 1999, for example, reports that test firings on cats have shown that low velocity missiles traveling as far as 2 cm from the brainstem will nevertheless cause respiratory affects, and that *"A patient with a gunshot wound to the head will tend to present in the emergency room with signs and symptoms of brainstem compression and tonsillar herniation, which include apnea and bradycardia..."* It then claims *"It is the sudden increase in intracranial pressure caused by the temporary cavitation that can result in coma or death, even if eloquent structures are not directly affected by the bullet."*

Well, this raises a few questions. As the increase in intracranial pressure brought about by a bullet's passage within a skull would be related to the size of the skull, wouldn't the respiratory affects caused by a bullet passing 2 cm from the brainstem in a cat's skull be greater than that in a human skull? And, if so, well, then, doesn't this suggest that a low velocity missile would have to come closer than 2 cm to the brainstem to cause respiratory affects in a human?

And what about the suggestion patients with gunshot wounds to the head *"tend"* to show signs of tonsillar herniation--that is, that they tend to show signs--such as problems with their respiration--that the increased intracranial pressure forced the bottom of the cerebellum and brainstem down through the foramen magnum of the skull?

No such herniation was noted at Kennedy's autopsy. Can we take from this then that the damage to Kennedy's cerebellum, and his problems breathing while at Parkland Hospital, were caused not by the passage of a high velocity bullet elsewhere in the skull, but from the passage of a low velocity bullet nearby? I'm not so sure.

Let's remember, however, that Kennedy's wounds were far from typical. The top of his skull exploded. Is it reasonable to assume this explosion released much of the pressure that would otherwise be exerted downward on the cerebellum and brainstem? I suspect so.

This then leads me to suspect the problems with Kennedy's respiration were caused by some other phenomena, quite possibly the passage of a low velocity bullet past his cerebellum.

Thus, irony among ironies, Kennedy may have told us something with his very last breath, not with the ease of his words, but with the difficulty of his breathing.

Two and a Half Witnesses

Fox autopsy photo, the infamous "stare of death" photo, revealing the damage to Kennedy's right eye socket. Note also the wound on Kennedy's right cheek.

Face sheet created by Richard Lipsey for HSCA staff members Andy Purdy and Mark Flanagan

Two and a Half Witnesses

Having established, however, a strong case for a new perspective on the President's wounds, the statements of three autopsy witnesses become relevant. While their memories and/or impressions could very well be wrong, if they are correct, then the conspiracy to suppress the medical evidence began much earlier than one might otherwise believe. The first witness whose statements are relevant to our analysis is Dr. George Burkley, the President's physician. Burkley was the only doctor to view Kennedy's remains in both Dallas and Bethesda. While he died some time ago, he nevertheless left behind a trail which tells an altogether different story than the one provided by the government.

1. The day after the assassination, Dr. Burkley prepared Kennedy's death certificate. He listed the cause of death as simply "Gunshot wound, skull" (no specific entrance and exit). In the summary of facts he

explained that Kennedy was “struck in the head” and that the wound was “shattering in type causing a fragmentation of the skull.” He said the “second wound occurred in the posterior back at about the level of the third thoracic vertebra.” This location was slightly lower than the location eventually decided on by the autopsy surgeons and was far too low to be compatible with the single-bullet theory. Also intriguing, however, Burkley’s mentioning the small entrance wound on the back discovered at the autopsy but failing to mention the small entrance wound on the back of the skull discovered at the autopsy suggests the possibility he had doubts this small entrance wound connected to the large defect.

2. On November 27, 1963, the FBI delivered the Harper fragment to Dr. Burkley. Two memos found in HSCA record 180-10116-0052, File 02504, indicate Burkley received another skull fragment around this same time from the Secret Service and that both of these items were to be “turned over to Naval Hospital by Dr. Burkley for examination, analysis, and retention until other disposition is directed.” And yet Dr. Humes, who was yet to perform his analysis of Kennedy’s brain on the 27th, and had therefore not completed Kennedy’s autopsy, told the ARRB that Burkley never even told him about the fragment. So what became of it? Did Burkley give it to Humes’ superiors, who then kept it from Humes? Or did Burkley realize it had both internal and external beveling, which indicated that it came from a tangential wound, and then help it disappear?

3. On October 17, 1967, Dr. Burkley was interviewed by William McHugh on behalf of the Kennedy Library. When asked about the autopsy of President Kennedy, he told McHugh “My conclusion in regard to the cause of death was the bullet wound which involved the skull. The discussion as to whether a previous bullet also enters into it, but as far as the cause of death the immediate cause was unquestionably the bullet which shattered the brain and the calvarium.” While, on the surface, this seems to agree with the autopsy report, the “previous bullet” mentioned by Burkley could very well mean “the previous bullet to strike Kennedy in the skull but not shatter his calvarium.” Supporting this speculation, when McHugh asked Burkley if he agreed with the Warren Report’s conclusions “on the number of bullets that entered the President’s body,” Dr. Burkley replied “I would not care to be quoted on that.” (It’s possible, of course, that Burkley’s concern here was the throat wound, which he never associated with the back wound. If he thought this wound was unrelated to the back wound, then he would have by extension believed Kennedy to have been hit at least three times, from both the front and from the back.)

4. A memo created by the original chief counsel of the HSCA, Richard Sprague, and found years later in his files, indicates that on March 18, 1977, he spoke to William Illig, Burkley’s attorney. Illig told Sprague that Burkley had information indicating that Oswald did not act alone.

5. When HSCA staff member Andy Purdy finally spoke to Burkley on August 17, 1977, however, the most Burkley said about the possibility of a conspiracy was that “the doctors didn’t section the brain and that if it had been done, it might be possible to prove whether or not there were two bullets.”

6. On November 28, 1978, towards the end of the HSCA’s investigation, Burkley signed a sworn statement stating that he was interviewed by Mark Flanagan and Andy Purdy of the HSCA in January 1978. In this statement, he acknowledges “I supervised the autopsy and directed the fixation and retention of the brain for future study of the course of the bullet *or bullets*.” (I hope to find Flanagan and Purdy’s account of this interview in the future.)

7. In a letter accompanying the statement and found in the HSCA’s files Burkley noted further that “Had the Warren Commission deemed to call me, I would have stated why I retained the brain and the possibility of two bullets having wounded President John F. Kennedy’s brain would have been eliminated.”

8. In his book *Reasonable Doubt*, writer Henry Hurt claimed to have spoken to Burkley in 1982 and to have been told by Burkley that he believed Kennedy was killed by a conspiracy.

9. A January, 1997 memo by Doug Horne of the ARRB reflects that he contacted Burkley's daughter and asked her to grant access to the files on her father kept by his former attorney, William Illig. It was hoped that these files would contain the information Mr. Illig had called Richard Sprague about almost twenty years earlier. She initially agreed, but by July, 1998, had changed her mind.

Nevertheless, by piecing together Burkley's statements, we can approximate what he was thinking. Nowhere in his statements did he ever say the fatal bullet entered the back of Kennedy's head. Consequently, when he mentioned a "previous bullet" to McHugh it's possible he was referring to an earlier, less severe head wound. Since his placement of the back wound ruled out the single-bullet theory, and since he suspected two bullets struck Kennedy in the head, it's quite possible he suspected Kennedy was killed in the manner here proposed.

A second witness of interest was Tom Robinson, who worked at Gawler's Funeral Home. He helped clean up and reconstruct the President's skull after the autopsy. While his recollections of many of the details of that night were foggy—some changed dramatically between his 1977 interview with the HSCA and his 1996 interview with the ARRB—he nevertheless made several relevant statements. As we've seen he told the HSCA that "The inside of the skull was badly smashed." But that's just the start of it. He also remembered something about the bullet exiting from the throat, that the bullet "might have been coming from the head and down," and that he remembers the doctors probing "at the base of the head," with an "18 inch piece of metal." He told the ARRB, 19 years later that, "there were fractures all over the cranium, including the floor of the skull," and that he had "vivid recollections of a very long, malleable probe being used during the autopsy. His most vivid recollection of the probe is seeing it *inserted near the base of the brain in the back of the head (after removal of the brain), and seeing the tip of the probe come out the tracheotomy incision in the anterior neck. He was adamant about this recollection.* He also recalls seeing the wound high in the back probed unsuccessfully, meaning that the probe did not exit anywhere."

While some have sought to discredit Robinson's statements by pointing out their inconsistencies, they can not be wholly discounted. His memories on some details have proved accurate. For instance, he told the ARRB that "he saw 2 or 3 small perforations or holes in the right cheek during embalming, when formaldehyde seeped through these small wounds and discoloration began to occur." These wounds, not mentioned in the autopsy report, and rarely mentioned elsewhere, are indeed visible in the "stare of death" autopsy photo. While such wounds are consistent with a bullet's exploding near Kennedy's temple while his head was leaning 25 degrees to its left, it's difficult to see how they could be caused by a fragmenting bullet sailing upwards from his cranium, as proposed in Larry Sturdivan's scenario.

Finally, there's Richard Lipsey, who was a military aide to the general responsible for Kennedy's funeral, General Wehle. Lipsey was ordered to keep an eye on the President's body during the autopsy. Consequently he sat close by and tried to listen to what the doctors were saying. He prepared a face sheet for the HSCA staff depicting the President's wounds as he remembered them being discussed. And they're exactly as I've proposed! In dismissing Lipsey's account, the HSCA medical report said "*Lipsey apparently formulated his conclusions based on observations and not on the conclusions of the doctors. In this regard, he believed the massive defect in the head represented an entrance and an exit when it was only an exit. He also concluded the entrance in the rear of the head corresponded to an exit in the neck. This conclusion could not have originated with the doctors because during the autopsy they believed the neck defect only represented a tracheostomy incision...Thus, although Lipsey's recollection of the number of defects to the body and the corresponding locations are correct, his conclusions are wrong and are not supported by any other evidence.*"

How strange that the writers of this report represent these as Lipsey's conclusions, when his testimony is clear that this is simply what he believes he overheard! The panel never even asked the autopsy

doctors if a shot connecting the wounds in the hairline and neck had been considered. The possibility of such a trajectory is never even discussed in their report. If the HSCA forensic pathology panel believed Lipsey to be wrong then they should have just said he probably misunderstood the doctors. Instead, the panel, which concluded that the Bethesda doctors' recollections were off by 4 inches on the head wound and at least 2 inches on the back wound, concluded that Lipsey was obviously wrong because his testimony was in disagreement with the statements of these very same doctors!

Had the panel confused the Hippocratic Oath with a lifelong pledge to be hypocrites?

Something strange was most certainly afoot. In 2012, Lipsey's rapidly rejected recollection that, at least for a time, the autopsy doctors thought the large head wound represented both entrance and exit, gained further support. From an unexpected source: Secret Service Agent Clint Hill. Now, it had long been noted that Hill, in both his Secret Service reports and Warren Commission testimony, claimed to have been shown Kennedy's wounds during the autopsy. And it had long been observed that he recalled seeing a small back wound, and large head wound, but had no recollection of being shown the supposed entrance on the back of Kennedy's head. But, until the publication of Hill's book *Mrs. Kennedy and Me*, in 2012, he'd never recounted a discussion he'd had with one of Kennedy's autopsists, presumably Dr. Humes. Here, then, is this account:

"Moving the body back and slightly to the left he pointed out the wound in the upper right rear of the head. I swallowed hard, listening closely, as the doctor explained what had happened. It appeared that the impact of the bullet hitting the president's head was so severe, it caused an explosive reaction within the makeup of the skull and brain, so portions of the brain erupted outward, and a portion of the skull with skin and hair attached became like a flap. The image of what I saw when I was up above the backseat came flashing back into my mind. The head wound was exposed and I could see into his brain, part of which had exploded outward. It looked like somebody had flipped open the back of his head, stuck in an ice-cream scoop and removed a portion of the brain, then scattered it all over Mrs. Kennedy, the car, and myself. It was a horrific sight. And I couldn't get it out of my mind. "Yes Doctor," I said "That is exactly what happened. I know I saw it. I was five feet away from the president when it occurred."

Note that in Hill's account neither the doctor nor Hill say anything of the wound's being an exit for a bullet entering elsewhere. Note further that Hill says the doctor attributed the nastiness of this wound to the impact of the bullet itself, and not that the bullet made a small hole upon impact and left a big exit after breaking up. Note also that Hill says it looked like someone had stuck an ice cream scoop into the head--with the force thereby coming from above, not below. Hill thought, and the doctor apparently agreed, that the bullet impacted at this location, the location later claimed to be an exit.

This is not as far-fetched as one might at first suspect. Hill's impression that the damage to the brain was less extensive than the damage to the skull was shared by at least one participant in the autopsy. In 1993, Humes and Boswell's assistant James Curtis Jenkins told writer William Law, that, after inspecting Kennedy's brain *"My impression of the brain was that the damage to the area of the brain, the extensiveness of it, did not quite match the extensiveness of the wound. In other words, the damage to the brain seemed to be a little less than you would expect from (the damage to the skull)"* (Note: the words *"the damage to the skull"* were in parentheses in Law's book, *In the Eye of History*, and presumably reflect that Jenkins ended his thought without ending his sentence.)

That Hill thought the bullet impacted at the supposed exit location, and not on the far back of the head, is confirmed, furthermore, by his eyewitness accounts of the shooting. Until 2010, he'd just say that Kennedy was "hit in the head." While promoting the book *The Kennedy Detail*, however, he got a bit more specific.

- "When I got to the presidential vehicle, just as I approached it, a third shot rang out, **hitting the**

president in the head, just above the right ear, and left a hole about the size of my palm." (11-14-10 article in the London Daily Mail)

- "About the time I got to the car, just before I got there, the third shot--that I heard, and I felt--because **it hit the President in the head just above the right ear**, right up in here (he places his hand just above his right ear, with some of his fingers to the back of the his ear), and blood and brain matter were spewing all over the place, including on me." (11-20-10 interview of Hill and Gerald Blaine by Gary Mack at the Sixth Floor Museum, broadcast on CSPAN2, 12-12-10)
- "I was just feet away when I heard and felt the effects of a third shot. **It hit the president in the upper right rear of his head**, and blood was everywhere." (Article by Hill in the New York Times, 11-22-10)
- "By the time I had just about got to the car--I was a few feet from it--there was another shot. **It hit the President in the head above the right ear.**" (Unidentified book store appearance captured in Youtube video US Secret Service Agent Clint Hill Recalls Dallas, uploaded 11-24-10)
- "**The third shot which I heard and felt because I was near the presidential vehicle when that happened hit the president in the head--upper right rear of the right ear--**and it spewed blood matter, brain matter, and bone fragments out over the car and myself." (BBC 4 audio interview published online, 12-1-10)
- "As I approached the vehicle there was a third shot. **It hit the President in the head, upper right rear of the right ear**, caused a gaping hole in his head, which caused brain matter, blood, and bone fragments to spew forth out over the car, over myself." (12-3-10 appearance at Warwick's Bookstore, New York City, posted on Youtube)
- "**The president had been hit in the upper right rear of his head with that third shot.**" (10-9-11 article on Hill on the Fargo--Moorehead Inforum)

Let's recall that the autopsy doctors ultimately claimed the bullet entered low on the back of the head. Let's recall as well that the red spot in the cowlick later claimed to mark the bullet's entrance was not remotely near the right ear.

This demonstrates that Hill thought, and apparently still thinks, the bullet entered at the supposed exit. That this is supported by his recollection of a discussion with a doctor is undoubtedly intriguing, and lends strong support for Lipsey's claim such things were discussed during the performance of Kennedy's autopsy.

It's actually worse than that. As Hill told the Warren Commission his observation of the President's wounds came after the autopsy had been completed, his recent account suggests that, at the end of the autopsy, the doctors were of the impression a bullet impacted at what they later claimed was an exit. Precisely as claimed by Richard Lipsey, in 1978.

There's actually more to this than one might think... Sibert and O'Neill, the FBI agents at Kennedy's autopsy, left the hospital after the autopsy had been completed. This was around the same time Clint Hill discussed the head wound with the doctor.

Here then is how Sibert and O'Neill described the head wound in their airtel to FBI headquarters, written shortly after they'd returned from Bethesda: *"Total body x-ray and autopsy revealed one bullet entered back of head and thereafter emerged through top of skull."* Note that they did not specify a small entrance low on the back of the head. This could be a reference to one wound of entrance and exit. While their official report, written over the next few days, describes in some detail the discovery and probing of Kennedy's back wound, no mention is made of the discovery of a small entrance wound on the back of Kennedy's head. Instead, they write the following:

"Also during the latter stages of the autopsy, a piece of the skull measuring 10 x 6.5 centimeters was

brought to Dr. HUMES who was instructed that this had been removed from the President's skull. Immediately this section of skull was X-Rayed, at which time it was determined by Dr. HUMES that one corner of this section revealed minute metal particles and inspection of this same area disclosed a chipping of the top portion of this piece, both of which indicated that this had been the point of exit of the bullet entering the skull region.

On the basis of the latter two developments, Dr. HUMES stated that the pattern was clear that the one bullet had entered the President's back and had worked its way out of the body during external cardiac massage and that **a second high velocity bullet had entered the rear of the skull and had fragmentized prior to exit through the top of the skull.** He further pointed out that X-Rays had disclosed numerous fractures in the cranial area which he attributed to the force generated by the impact of the bullet in its passage through the brain area. He attributed the death of the President to a gunshot wound in the head."

Now, this, too, could be a reference to one wound of entrance and exit. While the small hole by the EOP described in the autopsy report is, in my impression, readily apparent in the autopsy photos, the thought occurs that the doctors failed to tell the FBI about this hole, for fear it would leave them with more wounds than could readily be explained. Let's remember that the autopsy report, in which this wound was first described, was not provided the FBI until the Warren Commission asked for it, weeks after the FBI had, for all intents and purposes, closed the case.

The subsequent statements of Sibert and O'Neill support this analysis. An HSCA report on a 1977 interview of Sibert reflects that he said the head wound--singular, not plural--was in the "upper back of the head." It notes further that he "has no recollection of writing down the location of the entrance wound in the President's head." It then presents a drawing, presumably made by Sibert, in which one wound is depicted on Kennedy's head, a large wound high on the back of his head. Sibert's 1978 affidavit for the HSCA confirms that, yessirree, he had no recollection of the small bullet hole of entrance described by the doctors. He describes three wounds: the large head wound, the neck wound they believed to be a tracheotomy incision, and the back wound. He then discusses his earlier meeting with HSCA staff members Kelly and Purdy, in which he was shown the autopsy report, and writes "I have no recollection of hearing or writing down measurements relating to the entrance wound in the president's head." He confirmed this, yet again, in 1997, when testifying before the ARRB. When asked if he recalled any discussion of an entrance wound in the skull, he replied: "You mean, other than the one there that went in and that blew out on exit?" He then clarified: "A separate entrance wound in the skull? Is that your question?" But the ARRB's Jeremy Gunn failed to follow up on this. He did, however, ask Sibert if he recalled the doctors discussing a specific entrance location, to which Sibert admitted "I don't recall that. Just that general statement." Gunn then did the clarifying: "So they said it entered the back of the head?...But nothing more specific?" To which Sibert replied "Yes" and "Correct."

O'Neill was better, but not much. The HSCA report on its 1978 interview of O'Neill reflects that "In reference to the head wound, O'Neill recalled that it was massive and pointed towards the right side of his (O'Neill's) head." The report then claims "O'Neill said that the autopsy doctors felt that the bullet that entered the head struck the center, low portion of the head and exited from the top, right side, towards the front." He then drew his interviewers a diagram of this wound, in which the words "entry" and "exit" were written at opposite ends of a large hole.

Well, hello. This suggests he never saw the small hole near the hairline described in the autopsy report. This is further supported by his 1978 affidavit, in which he repeats that the head wound was "massive" and on the "right side of his head," and repeats, to a word, "that the autopsy doctors felt that the bullet that entered the head struck the center, low portion of the head and exited from the top, right side, towards the front." It's intriguing that he so readily reports what the autopsy doctors "felt," but is so

hesitant to report what he saw. In any event, in 1997, when O'Neill was asked by the ARRB's Gunn if he recalled being told the measurements for this entrance wound, he got a bit testy, and replied first that *"If it's in my report, then I do recall it"* and then, a bit later, *"if they did make a statement to that effect, I would have put that in my report."*

Neither Sibert, nor O'Neill, nor Hill, were shown or told about the small entrance wound near the hairline during the autopsy.

And there's yet another curiosity. While Hill's boss, Roy Kellerman, told the Warren Commission he'd observed an entry wound about the width of a *"little finger"* in Kennedy's *"hairline"* an inch and a half to two inches below the hole on the back of the head on display at the end of the autopsy, the 8-29-77 HSCA report on an interview with Kellerman reflects that he only recalled *"one large hole in the head and no small holes in the head."* Not sure what to make of that... Perhaps Kellerman had become aware of the controversy surrounding the entrance wound he'd once claimed to have seen, and was trying to stay out of it. Or perhaps those interviewing Kellerman for the HSCA, Jim Kelly and Andy Purdy, asked him a quick question about the head wound, and were unaware of his previous testimony.

In any event, it seems possible the autopsy doctors deliberately concealed the existence of the small hole on the back of the head from the FBI. Were they worried its existence would force them to conclude there'd been more than one shooter? Did they then, the next day, after realizing they could claim this hole marked the entrance for a bullet exiting high on Kennedy's head, change their collective mind?

If so, this might explain why Dr. Humes burned both his notes, and his initial draft of the autopsy protocol.

Something strange was most certainly afoot.

45 Degrees of Coincidence?

Above: Warren Commission Exhibit CE 385, prepared under the supervision of Dr. James Humes. In his March, 16, 1964 testimony before the Commission, Dr. Humes testified that the approximate angle of decline of the bullet in the drawing was 45 degrees. Where did he get this from? Was this angle measured at the autopsy? This 45 degrees certainly didn't come from the drawing itself. The angle of descent of the bullet in this drawing is less than one third as steep as Humes testified.

As one can see in the illustration at left, a bullet entering the actual back wound location and descending 45 degrees within the body would not exit from the throat, but the lower chest. Strangely, however, a bullet entering at the head wound location noted at the autopsy and descending 45 degrees within the body would exit precisely at the location of the throat wound. Is this just a coincidence? Or was this 45 degree angle measured at the autopsy, and then spat out by Dr. Humes without his realizing the angles had changed when he'd decided the back wound connected to the throat wound?

45 Degrees of Coincidence?

Sometime after coming to the suspicion the head wound entrance and throat wound were connected, I noticed a strange convergence of 45 degree angles. Consider:

1. The 2 AM 11/23/63 FBI teletype in which the results of Kennedy's autopsy were first forwarded to headquarters relates "One bullet hole located just below shoulders to right of spinal column and hand probing indicated trajectory angle of **forty-five** to sixty degrees downward and hole of short depth with no point of exit."
2. The 11/26/63 FBI report of FBI Agents Sibert and O'Neill on the autopsy confirms "During the latter stages of the autopsy, Dr. Humes located an opening which appeared to be a bullet hole which was below the shoulders and two inches to the right of the middle line of the spinal column. This opening was probed by Dr. Humes with the finger, at which time it was determined that the trajectory of the missile entering at this point had entered at a downward position of **45** to 60 degrees. (Further probing determined that the distance traveled by this missile was a short distance inasmuch as the end of the opening could be felt with the finger.)"
3. On March 16, 1964, Dr. Humes testified before the Warren Commission and the magic number 45 re-surfaced.

Mr. Specter. *Dr. Humes, can you compare the angles of declination on 385, point "C" to "D", with 388 "A" to "B"?*

Commander Humes. *You will note, and again I must apologize for the schematic nature of these diagrams drawn to a certain extent from memory and to a certain extent from the written record, it would appear that the angle of declination is somewhat sharper in the head wound, 388, than it is in 385. The reason for this, we feel, by the pattern of the entrance wound at 388 "A" causes us to feel that the President's head was bent forward, and we feel this accounts for the difference in the angle, plus undoubtedly the wounds were not received absolutely simultaneously, so that the vehicle in which the President was traveling moved during this period of time, which would account for a difference in the line of flight, sir.*

Mr. Specter. *Aside from the slight differences which are notable by observing those two exhibits, are they roughly comparable to the angle of decline?*

Commander Humes. *I believe them to be roughly comparable, sir.*

Mr. Specter. *Could you state for the record an approximation of the angle of decline.*

Commander Humes. *Mathematics is not my forte. Approximately 45 degrees from the horizontal.*

4. This 45 degree angle was then confirmed by Dr. Finck.

Mr. Specter. *And do you concur in Dr. Humes' statements and opinions regarding the point of entry C, point of exit D, and general angle on the flight of the missile?*

Colonel Finck. I certainly do.

5 The angle of descent from the entrance near the EOP to the presumed exit on the throat is 45 degrees.

This seems way too great a coincidence. I mean, think about it. The angle of descent in the drawing created for Humes was nowhere near 45 degrees. Dr. Humes was an educated man. Could he really have been this bad with numbers? Or was the 45 degrees something he remembered measuring at the autopsy? Since he mentioned 45 degrees to the FBI at the autopsy, in relation to the back wound, this sounds reasonable. That the FBI report says the back wound was discovered in the "later stages of the autopsy", moreover, suggests the possibility the doctors had already discussed the head wounds and throat wound prior to their discussion of the back wound. Perhaps, then, they measured a 45 degree descent between the head wound entrance and throat wound before discussing the back wound in detail, and had noted that the descent within the shallow back wound seemed to match this trajectory. Since Humes admitted burning his notes and the first draft of his report, we may never know.

On the other hand, it's possible the 45 degrees mentioned in Humes' testimony was not so innocent, and that, knowing full well that the FBI report reflected he'd said the bullet creating the back wound descended at 45 degrees, he was deliberately pretending that the 45 degree or greater descent approximated at the autopsy was consistent with the drawing he'd had created for the Warren Commission. If so, his volunteering that he was bad with math could have been his way of deflecting the criticisms he knew would come once people saw the FBI's report, and the actual wound locations. Humes certainly should have known that his night-of-the-autopsy approximation of a 45 degree descent was totally inconsistent with his day-after conclusion that the bullet exited from Kennedy's throat, on the same level as the entrance. If he was deliberately clouding the issue, as proposed in this scenario, then it seems possible as well that Arlen Specter, who'd met with FBI agents Sibert and O'Neill while preparing Humes' testimony, was well aware of Humes' deception, and had even coached him on it.

There's something else to consider. An 11-23-63 AP news story on the assassination credited to Frank Cormier (found in the Sumter Daily Item) makes the bizarre claim that the assassin's bullets "traveled

about 100 yards at a 45 degree angle." Well, where did this come from? If this was something Cormier had heard on the radio the evening before, or had seen in an earlier paper, well, perhaps Humes had heard this same broadcast, or had read this same article. If so, then perhaps this influenced his statements during the autopsy, and in turn his subsequent testimony. To be clear, he may have been under the belief the sniper's nest in the book depository really was 45 degrees above Kennedy at the time of the shooting. Perhaps he was simply too ignorant to realize a bullet traveling 100 yards at a 45 degree angle would have to have been fired from a building twice as tall as the book depository. Perhaps he fudged his numbers, and had relied on someone as clueless as himself.

There is no easy answer on this one. It's either a total coincidence that a bullet descending from the head wound entrance to the throat wound would be descending at 45 degrees and Dr. Humes said the angle of descent within the body of the bullet exiting the throat was 45 degrees OR Dr. Humes was not nearly as bad at math as he claimed but was instead trying to cover up the true nature of Kennedy's wounds. No, hold it. On second thought, there's a third option, where Dr. Humes was helping to cover up the bullet's actual trajectory, but knew this to be wrong, and was pretending to be bad at math in order to get the actual bullet trajectory--a descent within the body at 45 degrees-- on the record. I kinda like that one. Something to think about. Not that there's not already more than enough to think about.

Probing the possibilities

Now, to be clear, I am not the first researcher to suspect the doctors connected the back of the head wound and throat wound at autopsy. A 1998 article by Milicent Cranor in the Kennedy Assassination Chronicles, discussed this very possibility. It is important to note, however, that she relied almost exclusively on eyewitness statements in her article. That I would come to this suspicion based purely on the medical evidence, while she would come to this same suspicion via the eyewitness evidence, is undoubtedly intriguing.

As pointed out by Cranor, if the doctors noted the large head wound at the beginning of the autopsy, and a shallow back wound when they turned the body over, as seems logical, they had evidence for two bullets at the beginning of the autopsy. As they, or those supervising them, had presumably been told that Governor Connally had been wounded in his chest, wrist and thigh, that three shots had been heard, and that three bullet shells had been found in the sniper's nest, they would have known from the beginning then that their finding an additional wound on Kennedy would mean more shots were fired than heard, and that there had almost certainly been more than one shooter.

If the doctors later discovered a small bullet entrance on the back of Kennedy's head, and probed this wound, and found that it connected to the tracheotomy incision on Kennedy's throat, as claimed by Lipsey and Robinson, they would have done so, then, with the full knowledge they were out of bounds, so to speak, and had found evidence for a high-tech conspiracy using silenced ammunition. This makes the subsequent claim that they were not allowed to dissect and examine Kennedy's neck--which would have verified this trajectory--all the more intriguing. Were they told not to do so out of respect for the Kennedy family, as claimed, or because this would have demonstrated this third wound beyond all doubt? Did they in fact probe the wound then decide amongst themselves to pretend they hadn't done so?

Or was there an even broader "cover story"? Did they actually not only probe the wound, but remove the organs of the neck afterward?

Maybe. In 1977, mortician Tom Robinson told the HSCA not only that the wound was probed but that the neck organs were removed during the course of the autopsy.

This isn't at all far-fetched. It's undoubtedly suspicious that, in the official story, the autopsy team was not only unaware of Kennedy's throat wound on the night of the autopsy, but was purported to have thought the deep gash they observed came purely as a result of the tracheotomy performed in Dallas. Now, if the team had stuck to this story, and witnesses had confirmed this story, one might be tempted to believe such a story. But instead we have not only Lipsey and Robinson saying they saw the doctors connect the head wound to the throat wound during the autopsy, but Dr. Boswell telling both the HSCA pathology panel and the ARRB that the autopsy team suspected on the night of the autopsy that the tracheotomy incision had been cut through a bullet wound. Now, unfortunately, Dr. Boswell is not the most consistent of witnesses. But Dr. Ebersole, the autopsy radiologist, actually went a bit further than Boswell and told the HSCA panel that the doctors *knew* the throat wound to be a bullet wound on the night of the autopsy. Well, unfortunately, Ebersole's recollections are also not reliable. But John Stringer, the autopsy photographer, also said he thought the doctors knew there'd been a bullet wound in Kennedy's throat on the night of the autopsy...and even told the ARRB he thought he saw the doctors probe this wound while searching for bullet fragments...

So... from this it would seem likely the autopsy team knew of the throat wound on the night of the autopsy. This possibility is undermined, however, by the failure of Dr.s Humes and Finck to acknowledge knowing of this wound at so early a time, and the failure of the FBI's report on the autopsy to mention such a wound. The FBI's failure to mention this wound, however, can be explained by the disturbing possibility the doctors knew full well that their documenting a bullet's passage from the back of the head to the throat would make a conclusion of conspiracy inevitable, and that they then conspired to hide this from the FBI by only telling them of evidence for two bullets--a shallow back wound, and an entrance and exit on the head.

So why, if this is so, would they reverse their findings the next day, and suddenly claim the back wound connected to the throat wound? Well, perhaps Dr. Humes realized after talking to Dr. Perry in Dallas that the cat was out of the bag, and that Perry had discussed this throat wound in detail during the Parkland press conference. This is the official story, after all, and in this case it actually makes sense.

Well, if Humes knew about the throat wound during the autopsy, then why didn't he just claim the back wound connected to the throat wound then and there, one might ask? Well, that question has an even better answer. The FBI agents at the autopsy, Sibert and O'Neill, had witnessed the probing of the back wound, and had been led to believe it was a scientific fact that the bullet creating the back wound did not exit. Dr. Humes, then, may have realized that he couldn't turn around and claim that the bullet creating the back wound had exited the throat, and not arouse suspicion from the agents. He may then have simply opted to pretend there was no throat wound, in hopes it had been overlooked in Dallas.

Or perhaps not. The statements of Dr. Humes' and Dr. Boswell's assistants at the autopsy, James Jenkins and Paul O'Connor, have long been used by conspiracy theorists to suggest a conspiracy. And yet, although O'Connor told author William Law that the autopsists thought the throat wound was a bullet wound, but were prevented from probing the wound by Admiral Burkley, neither of them recalled the throat wound being probed on the night of the autopsy... Now, this may have been by design. A 1977 HSCA report on an interview with O'Connor relates that "*Boswell or Humes told him to go outside the room*" while the body was dissected and probed, and that a Marine guarded him while he waited outside.

So...IF the doctors put a probe in the back of the head wound, and found it came out at the throat wound, as asserted by Lipsey and Robinson, it would appear they were being deliberately secretive about it...and that almost no one at the autopsy knew of it.

Now, one might wish to take from this that this probably didn't occur, and that the doctors probably didn't even know about the throat wound during the autopsy. But the suspicion that the doctors at least

suspected a bullet had come down the neck, and were prevented, for political purposes, from following up on this, cannot be so readily dismissed. Such a possibility, after all, would explain why some autopsy witnesses (Lipsey and Robinson) thought this trajectory HAD been demonstrated, why some key participants (Boswell, Ebersole, Stringer, and O'Connor) thought they knew of the throat wound on the night of the autopsy, and why still other key participants (Humes, Finck, and Jenkins) and witnesses (Sibert and O'Neill) felt sure the throat wound was not probed nor acknowledged as a bullet wound on the night of the assassination.

I mean, let's get real here. Two wounds were observed at Parkland, a head wound and a throat wound. The doctors treating Kennedy, moreover, had announced in a press conference held shortly after his death that these wounds may have been connected. The dissection of Kennedy's neck to determine the likelihood of this connection, then, would have to be viewed as one of the primary purposes of the autopsy held several hours later. And yet, of all the internal structures on Kennedy's body between his waist and the top of his head, the only area not examined was his neck.

This smells to high heaven.

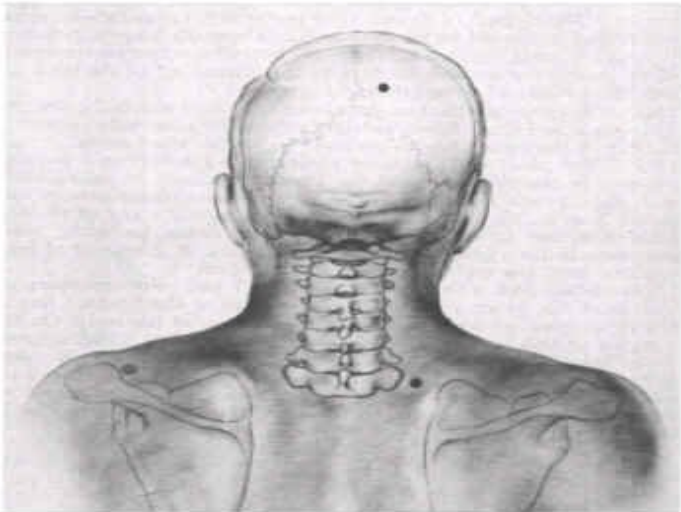

Chest X-Ray/ HSCA Back Entrance Comparison

Chest X-ray/HSCA Entrance Comparison

After reading Lipsey's account of the autopsy, and considering the 45 degrees of coincidence, I went back and re-read most of the other accounts of the autopsy, and found another reference supporting Lipsey's contention that the doctors suspected a bullet came down the neck. In the HSCA interview of autopsy photographer John Stringer, he distinctly recalled the autopsists having a "conversation about the pathway through the neck and specifically discussion about air in the throat." This implies that, far

from believing the throat wound was a mere tracheotomy incision, the doctors had other suspicions all along. The “air in the throat” is, almost certainly, a reference to the chest/neck x-ray.

Upon close examination of the chest/neck x-ray, one notes a black spot (representing air in the tissues) at the approximate level of the exit, at approximately the midline of the throat. This would appear to be the exit. Surprisingly, however, the black line which one would have to presume represents the bullet path, can be traced backwards up the neck, to a point much higher than the purported entrance in the President’s back. That the HSCA forensic pathology panel attached no importance to this “interstitial emphysema” (air in the tissues), even though one of its consultants, Dr. Seaman, considered it “highly suspicious compared with the other side,” whilst simultaneously embracing a bullet path between the hole in the back and the hole in the neck, which tore no muscles and broke no bones, yet could not be probed by the autopsy doctors, is mysterious, if not disturbing. That their projected path through the neck starting at the back entrance more than an inch and a half to the right of the President’s mid-line and ending at their proposed exit in the throat slightly to the left of the President’s mid-line blasted right through Kennedy’s spine, while they claimed the bullet never touched a bone, makes their actions doubly mysterious, or disturbing. They simply refused to follow the evidence. Or make sense.

While I initially had doubts that a wound track could be so obvious, I found a few people who seem to agree with me that this is a wound track. People who have seen a few wound tracks. Amazingly, the Clark Panel report, when discussing the back wound and the throat wound, declares: “There is a track between the two cutaneous wounds as indicated by subcutaneous emphysema and small metallic fragments on the x-rays...” Well, I’ll be! Perhaps this is the key to the Clark Panel’s mis-representing the vertical distance between the two wounds—while they could see that the bullet came down the neck, they just couldn’t fathom that it was coming from anywhere but the back wound. If someone were to coin the expression “assassination research makes strange bedfellows,” this would be a perfect example.

Yet another who believes the shadows are a wound track is Larry Sturdivan, the HSCA ballistics expert. In his book, *The JFK Myths*, Sturdivan declares “The x-rays show a faint, but perceptible, shadow of a wound track running from the entry location shown in the autopsy photos to the exit point at the suprasternal notch.” Since Sturdivan adds “The entry was located just above the transverse process of the first thoracic vertebra” however, it’s clear he’s trying to have it both ways, using an entrance slightly higher than the HSCA’s entrance location and insisting that the exit in the throat was not higher than the back wound, as claimed by the HSCA, but lower. Since the shadows on the x-ray begin much higher than T-1, however, we should reject Sturdivan’s conclusion. Moreover, I find it interesting that Sturdivan would call his book *The JFK Myths*, and claim it debunks the theories of the conspiracy community, and then submit that the HSCA had the entry location of the head wound, the exit location of the head wound, and the entrance location of the back wound incorrect. Perhaps he meant for his title to cut both ways. More to the point, since it seems clear that Sturdivan is deliberately disregarding the wound locations of the forensic pathology panel in his work, the question must be asked: why is it considered unpatriotic, unscientific, or anti-American to question the specific conclusions of the government’s panels when that leads you to conclude Kennedy was killed by a conspiracy, when it’s not considered unpatriotic, unscientific or anti-American to question their conclusions if you say Oswald acted alone? This double-standard, I believe, says a lot about why this case is still relevant.

Lattimer Drawing/X-ray/HSCA Drawing Comparison

One of the great surprises one receives when one comes to the conclusion that the air in the neck on the x-rays suggests a bullet traveled down Kennedy's neck is that Dr. John Lattimer, as solid a single-assassin theorist as ever walked the earth, agreed. (Yep, on this issue, the Clark Panel, Lattimer, Sturdivan, and I--surprise, surprise--*agree*!) In his 1972 articles on the medical evidence, and then again in his 1980 book, *Kennedy and Lincoln*, Lattimer presented a schematic drawing of the line of injuries in Kennedy's neck. He declared, proudly, that his drawing was based upon an actual x-ray. On January 10, 1972, in a radio interview with WNBC's Long John Nebel, moreover, Lattimer specified that when one studying Kennedy's x-rays one could see "air in the tissues in President Kennedy's neck along the track of the bullet." It is clear, then, that he believed the sharp descent in his schematic was justified by the air in the tissues apparent on Kennedy's x-ray.

This explains an awful lot. Much of the strangeness one encounters while studying Lattimer's research comes from his trying to correlate the track of the bullet he saw on the x-rays with his belief this bullet entered Kennedy's back. To do this, Lattimer distorted the arrangement of Kennedy's clothes and the shape of Kennedy's body on his drawing. This allowed the bullet to create an entrance on Kennedy's jacket 5 inches from the top of his collar, enter his back at the level of his "Adam's Apple," and travel inches down his neck. The nonsense of such a trajectory, and the desperation of Lattimer in proposing such a trajectory, is more than readily apparent.

When one compares Lattimer's drawing with Kennedy's actual x-ray, the supposed basis of the drawing, moreover, other distortions become clear. For one, the bullet fragments identified by a D on Lattimer's drawing, and purported by him to be "near the tip of the transverse process of the seventh cervical vertebrae," are not spread out above and below the bullet track, as depicted by Lattimer, but an inch or more below the bullet track he proposes. (The seventh vertebrae is at the top of the black area along the spine on the x-ray.) For two, the lung in his drawing is inches higher on the body than it is on the x-ray. As this lifts the bruise on the lung--something unlikely to be acquired by a bullet passing inches away--up to the bullet path, the reason for this distortion seems evident.

When one compares Lattimer's drawing of the President's wounds to a similar drawing created by the HSCA, his distortions become even more clear. The HSCA drawing, for starters, has the bullet entering Kennedy's back heading slightly upwards through the body while Lattimer's drawing has the bullet headed sharply downwards. The HSCA, in keeping with the autopsy photographs, moreover, places the back wound on the back while Lattimer lifts it up onto the neck. While the two present the lungs in the same place in comparison to the bullet track, this is not an agreement between the two but is actually a discrepancy, as Lattimer's bullet track is much higher within the body. While the HSCA presents the lungs as just below the level of exit when the body is erect, but higher than the exit due to Kennedy's severe forward pitch, Lattimer presents the lungs as being higher than the exit even when erect. Since Lattimer does not dispute that the bullet exited the throat midway between the Adam's apple and the bony notch at the bottom of the throat, moreover, this suggests that he believed Kennedy's lungs extended above his rib cage, into his neck.

Of course, this is preposterous. It's clear then that Lattimer, as Sturdivan, was trying to have it both ways: while his interpretation of the x-rays led him to believe the bullet traveled down the neck, he still wanted to be able to say the passage of this bullet bruised Kennedy's lung, even though his proposed trajectory would pass approximately three inches away from the nearest lung. While some, including Lattimer, have argued that the confusion around Kennedy's back wound is related to the fact that Kennedy's Addison's disease made him a hunchback, I don't believe that even one of these men has been foolish enough to suggest Kennedy's lungs changed position and rose above the level of his ribcage as a result of his affliction.

It was while comparing the lungs in these drawings that I had a bit of a breakthrough. While the HSCA and Dr. Lattimer were in agreement on the shape of the bruise on Kennedy's lung, which is consistent

in relation to the bullet cavity and is thus supportive that the cavity was the cause, I realized that on this issue both drawings were inaccurate. While the photograph of this bruise is one the doctors remembered taking, but never saw again, Dr. Humes' testimony on the bruise is quite clear, and is in disagreement with the drawings. He told the Warren Commission that the bruise was 5 centimeters at its greatest diameter "and was wedge shaped in configuration, with its base toward the top of the chest and its apex down towards the substance of the lung," and repeated that it "was a roughly pyramid-shaped bruise with its base toward the surface of the upper portion of the lung, and the apex down into the lung tissue." Humes was telling them, therefore, that the bruise came to a point. Such a bruise would not be expected from a temporary cavity, which radiates in an oval, but could very well have come as a result of a bullet deflecting from an overlying bone. Articles on pulmonary contusions from gunshot wounds reflect that they are far more prominent when a bullet slaps against a rib or chest wall than when a bullet actually traverses the substance of the lung. One such article, found in a 1944 edition of *Surgery*, reported on a study by Dr. Rollin Daniel in which dogs were shot and immediately dissected. This study connected the level of pulmonary contusion to the amount of energy released into the *adjacent non-lung tissue*. The single-bullet scenario, in which a bullet magically slides between muscles and does not damage the arteries, necessitates that the damage to the surrounding tissue was minimal. This suggests then that the lung was bruised through some other mechanism than the temporary cavity of the bullet. The first thoracic vertebrae attaches to the spine just above the uppermost margin of the lung. Did a bullet deflect off this bone from above, and thereby bruise the underlying lung?

The evidence suggests as much.

Lattimer Skeleton/X-ray Comparison

Lattimer Skeleton/ X-ray Comparison

Should one doubt that Lattimer believed the bullet traveled some distance down Kennedy's neck, one need only look at another photo published in Kennedy and Lincoln. This photo depicted the purported bullet path alongside a skeleton. Intriguingly, this skeleton appears to be missing a first rib, which represents the uppermost level of the lung in most humans. Even more intriguing, at the '93 conference on the medical evidence in Chicago, Lattimer presented a version of this photo in which the first rib was readily identified, at a point *thoroughly interfering* with the bullet's trajectory should Lattimer not have purported such a sharp descent within the neck.

In any case, in this photo, Lattimer made crystal clear his belief that the bullet entered around the level of the third or fourth cervical vertebrae, near the middle of Kennedy's neck, where no one but no one saw an entrance. Why he didn't realize such a bullet path would be more likely to have come from the hole in the hairline than from the hole in the shoulder can perhaps be attributed to his lack of imagination.

It certainly occurred to Dr. Cyril Wecht. A transcript to a January 10, 1972 WNBC radio interview of Dr. Cyril Wecht by John Nebel (found in the Weisberg Archives) reflects that Wecht, when told Dr. Lattimer, who'd viewed the autopsy materials the day before, claimed the x-rays showed the bullet entered inches higher than as shown on the Rydberg drawings, had thoughts similar to my own. He told Nebel that if the bullet hole was inches higher, as claimed by Lattimer: *"I'm telling you that that moves it from the back of the neck where it had been previously moved from lower down in the back, we're now moving it up higher into the head. I'm beginning to wonder whether Dr. Lattimer may have confused this with the bullet hole of entrance in the back of the skull near the right occipital protuberance which is that bony prominence that you'll feel on the back of your head if you'll put your hand there now and touch. Really--and I'm not being, again, sarcastic--if he moves up the bullet hole which is diagrammed in at the back of the neck, if he said to you that it's really a couple of inches higher, you're already getting up into the region of the occipital protuberance. I'm beginning to wonder which bullet hole he's talking about."*

Unfortunately, however, Wecht failed to follow up on this possibility when viewing the materials that August. And yet, seeing as he later told Vincent Bugliosi he'd had thoughts the throat wound marked the entrance for a bullet exiting near the EOP, it appears he continued to be intrigued by Lattimer's observation.

In any event, when one reflects that there were unexplained radiopaque densities by the transverse process (a bony finger sticking out from the spine) of both the President's sixth and seventh cervical vertebrae (C-6 and C-7), and that the transverse process to the first thoracic vertebrae, just above his lung, was indisputably fractured, one should realize that the damage to his vertebrae and the bruise upon his lung can be more readily explained by a bullet coming down his neck than by a bullet coming from an entrance on his back, which left no probe-able missile path through his muscles. That the bullet exited at the level of the lowest damage to his vertebrae, T-1, as opposed to the middle damage of his vertebrae, is yet another indication that that the damage did not come as a result of the temporary cavity surrounding the bullet, especially since in the Forensic Pathology Panel's interpretation the bullet was heading upwards in the body, and would therefore have been some distance from C-6 as it passed.

When one studies the x-rays, moreover, one can see a deflection of the bullet track where the first rib meets the spine. The shadow changes course and heads for the throat. Due to the aforementioned bruise, it would appear then that bone was struck. This, then, could represent one of the two deflections necessary for the bullet striking Kennedy near the EOP to exit from the middle of his throat. The other one occurred upon the entrance to his skull.

This would seem to be more than just a coincidence. Perhaps we are indeed on the right...track.

See No Evil

When I re-read the Final Report of the HSCA Forensic Pathology Panel, I was finally able to satisfy myself that a bullet descended in Kennedy's neck, most logically from the entrance in the hairline. Not because of what was said in the report as much as what was not said. What was not said was a convincing explanation for what appears to be a bullet track heading down the neck.

Here's how the forensic pathology panel dealt with the white spots apparent on x-ray number 8 and identified by the Clark Panel and Dr. Lattimer as possible bullet or bone fragments. These fragments just so happen to be directly along the bullet path from the occipital bone to the throat wound. An acknowledgment of these fragments as fragments, whether bone or metal, would call into question the single-bullet theory as proposed by the HSCA. So the doctors did what all prominent doctors do in a time of crisis. They brought in some specialists to tell them what they want to hear... Dr. McDonnell said the white spots were "artifacts not uncommonly caused by foreign materials on the film or in the developing solution." He stated further that the dark shadow seen on x-ray number 8 was not seen on x-ray number 9 and that this suggested this shadow too was an artifact. Dr. Chase said "the 1 by 2.5 millimeter object was too small and too dense to be bone; rather, the little trail of dots near the fragment was indicative of artifacts." Dr. Seaman said "there was a fragment-like object near the transverse process which was too dense to be bone ("fairly confident") He said the transverse process

appears normal with air present (*“possibly byproduct of tracheotomy”*), calling it “highly suspicious compared with the other side.” So here we have the HSCA’s radiology consultants basically saying that they don’t know what to make of the x-rays but that it’s okay by them if the forensic pathology panel decides they want to dismiss as artifacts what might just be bullet fragments in Kennedy’s neck. They’re also giving them the wink wink nod nod that they can call the apparent wound track coming down the neck, the possibility of which is never mentioned in the report, by the way, as “air” from the tracheotomy. Naturally, the panel took them up on their offer.

Here’s the hot air belched forth by the panel to dismiss the “air” in the neck, and the unspoken possibility the bullet came down the neck: *“The panel noted a general haziness and poorly defined decrease in radiodensity in the neck tissues just above the right chest cavity in films 8 and 9, and attributed this to interstitial emphysema. This was probably related to the surgical tracheotomy or missile injury to the trachea, followed by positive pressure insufflation, with a slight escape of air into the adjacent tissues. Continued breathing by the President, possible even after the trachea had been perforated by the missile because the overlying defect was more or less sealed by the shirt and necktie, could also have caused air to leak into the adjacent tissues.”* So the air backed up into Kennedy’s neck when his shirt and necktie somehow sealed off the exit from his throat???? And, by some strange chance, this air backed up into the neck on the right side only, even though the exit on the trachea was, according to the HSCA, slightly to the left of midline? And this air went up in a line that deflected off the first rib? When we recall that radiologist Dr. David Davis told the panel that air from a skull base fracture *came down* the neck, their lame attempts to explain how this air went *up* the neck seem especially pathetic. Clearly, as revealed by their dismissal of Lipsey’s statements, they refused to acknowledge the possibility that anything could come down the neck. One wonders why this is. I mean, why not just call the air an artifact and get it over with?

Unlike Dr. McDonnell, by the way, I don’t believe the dark shadows in x-ray number 8 are an artifact. Although there is clearly more air in the tissues than in the earlier x-ray, I believe they represent the same wound track as in the pre-autopsy x-ray, just from a slightly different angle. Since the bullet creating this wound was not found, moreover, it seems possible a piece of the bullet is still in there somewhere, hidden amongst the bones.

Perhaps this mystery will be solved when Kennedy is finally exhumed.

Down the Neck?

JFK Exhibit F-30

FIGURE 6.—X-ray of Dr. King after death and before autopsy.

When one compares the x-rays of Kennedy's neck used in Dr. Baden's HSCA testimony (Exhibits F-30 and F-31, at left and at center), with the x-ray of Martin Luther King's neck used in Dr. Baden's HSCA testimony (Figure 6, at right), one can see that the destruction in King's neck was far greater, and that the hunting ammunition used to kill him broke into pieces as it descended his neck. Still, the bullet passing through Kennedy's neck supposedly did so on a nearly flat trajectory, and supposedly struck no bone. So why is there ANY similarity? Did a projectile of smaller caliber than the one killing King descend Kennedy's neck without breaking up? Or are the shadows on F-31 some sort of illusion?

Down the Neck?

Or perhaps sooner... In 2009, after inspecting the x-rays of Martin Luther King found on the Mary Ferrell website, and entered into evidence during the HSCA hearings on his death, I realized that a comprehensive study of the x-rays of gunshot wounds to the neck might very well prove that a missile passed down Kennedy's neck, leaving air in the tissues. Although the soft-nosed bullet striking King's face and traveling down his neck left bullet fragments along the way, and although this bullet released far more energy in King's neck than the bullet presumed to have descended Kennedy's neck, the pattern and amount of air in the tissue was actually quite similar.

This suggests a bullet traveled down Kennedy's neck.

Still later in that year, I came across something else to give us hope these nagging questions may soon be resolved. With the publication of Doug Horne's Inside the Assassination Records Review Board came the dissemination of his reports on three meetings the ARRB had with three consultants. Of forensic pathologist Dr. Robert Kirschner's 4/11/96 meeting with the ARRB and study of the x-rays, Horne writes that the *"small dark areas near T-1 and T-2 were felt to be air due to some disruption...either the back wound or the skull wound. Dr. Kirschner said he would defer to the opinion of our Forensic Radiologist on this matter."*

Do you hear that, radiologists? That's history calling you to do your homework, study the x-rays, and solve this thing.

What Lies Beneath?

Above: the path of the lethal bullet as presented by the Boston Globe, 11-23-63. Note the 45 degree descent of the bullet, the precise angle of descent given by Dr. Humes for the bullet exiting Kennedy's throat. Was this a mere coincidence?

At right: a typical skull x-ray in which the teeth and jaw are shown. Such an x-ray would also show the first few cervical vertebrae, where a bullet striking near Kennedy's EOP and descending at 45 degrees would likely encounter his spine (as shown by the blue line).

At right: HSCA Exhibit F-53, Kennedy's right lateral x-ray, after enhancement. Is it just a coincidence that, in cropping Kennedy's jaw from the x-ray, his uppermost cervical vertebrae have also been removed?

What Lies Beneath?

And might I make a suggestion? Look at the head x-rays as well as the neck x-rays... While I long-ago rid myself of the suspicion Kennedy's teeth and jaw were cut off his published x-rays to hide a bullet in the jaw itself, I have in more recent times grown increasingly suspicious that the x-rays were cut to hide something else. When one looks at a skull x-ray complete with the teeth, and maps out a 45 degree descent from an imagined entrance by the EOP to an imagined exit on the throat, it becomes startlingly clear a bullet on this trajectory would encounter the spine around C1 or C2--the area of the spine cut off the x-rays of Kennedy's skull, at least in the HSCA's exhibits. As the uppermost vertebrae on the x-ray of Kennedy's neck, published as HSCA Exhibit F-30, appears to be C4, this means that C1--C3 are not shown on any of the published x-rays, from any angle. This seems more than a little suspicious...

In any event, the x-rays need to be inspected by someone well-versed in the radiology of gunshot wounds and open-minded to the possibility something came down the neck...

Finding someone open-minded on this point may just be the hard part.

Since I first came forward with my "theory" a bullet came down the neck, I have been subjected to insults from left and right, conspiracy theorists and single-assassin theorists alike. Some have even gone so far as to claim I dreamt up this theory all on my own (failing to realize that at least two witnesses to the autopsy shared this theory) and that no credible person could propose such a trajectory

(failing to see that a bullet's heading on this exact trajectory was the operating thesis for many of those curious about such things in the days after the assassination).

Let me clarify this last point...

As discussed, the Parkland doctors trying to save Kennedy's life thought it possible, even likely, that a bullet entering his neck blew out the back of his head. They said as much on 11-22-63.

And the science editor for the Boston Globe, Ian Menzies, writing for the next day's paper, and realizing that the shots had supposedly come from behind Kennedy, reversed the trajectory. He wrote:

"The rather meager medical details attributed to Dr. Malcolm Perry, the attending surgeon, described the bullet as entering just below the Adam's Apple and leaving by the back of the head. Since that statement Friday afternoon it is believed from determining the site of the firing that the bullet entered the back of the head first and came out just under the Adam's Apple."

A drawing depicting this trajectory accompanied Menzies article, and is shown on the slide above.

From this it seems likely that millions of Americans in the days after the shooting believed the bullet killing Kennedy had coursed down his neck from his head. Within weeks of the assassination, on December 18, in fact, the Washington Post had either forgotten or had pretended to have forgotten that the Parkland doctors' original statements had suggested otherwise, and instead reported: "one of the surgeons explained over television that he (Kennedy) was shot only once, and that a fragment from the bullet that hit his head coursed downward and emerged from the front of the throat."

As pointed out in chapter 1, moreover, the FBI and mainstream media continued to push that a bullet fragment came down Kennedy's neck for SIX MONTHS after the shooting, when the single-bullet theory explanation for the throat wound was leaked to the press. By conservative estimate, then, it's fair to say that a majority of Americans believed a bullet or bullet fragment came down the neck and that this perception only changed gradually. There never was, after all, a *medical* reason to doubt that a bullet or bullet fragment came down the neck...only a visual one--as Kennedy reached for his neck before frame 313, it seemed logical to assume his throat wound was unrelated to his head wound. That he'd had an earlier head wound was not even considered...

Thus, the major stumbling block to acceptance of the possibility raised by my study of the evidence--that a bullet came down Kennedy's neck around frame 224--is that those believing Dr. Humes, Boswell and Finck were SO incompetent and/or dishonest that they not only reported the wrong location for the head wound entrance, and were off by FOUR inches, but confirmed this location after viewing the autopsy photos on TWO separate occasions, COULD NOT POSSIBLY be so incompetent or dishonest they would miss or fail to report a hole in the base of Kennedy's skull, and a bullet's passage down his neck...

And that's really really inconsistent....and really really silly...

Look Again

In his April 1974 article in *Forensic Science*, Dr. Cyril Wecht presented two illustrations of a skull. Upon these he depicted the locations of the bullet fragments he'd observed on JFK's x-rays. These are shown above. At first glance one notices a major error—that Wecht depicted the large fragment on the back of the head above the forehead fragment on the drawing presenting the side view, but below the forehead fragment on the drawing presenting the front view. (This is demonstrated by the added blue, red, and yellow lines.) But look again. Wecht also depicts a fragment at the level of Kennedy's chin (the green line), which could be in his neck.. Could this be one of the fragments recalled by Jerrol Custer?

Look Again

Yep, in a mind-bending (not to mention tongue-twisting) change of perspective, I've found it's just silly to dismiss the possibility a bullet came down Kennedy's neck...

The silliness of such a thing is made even more clear, moreover, when one realizes that Jerrol Custer, one of the x-ray techs at Kennedy's autopsy, told the ARRB in 1997 that he recalled seeing bullet fragments in Kennedy's neck around C3--C4. While Custer was unable to find these fragments on the existing x-rays, and said he suspected he'd seen them on a now-missing A-P x-ray of the cervical spine, his claim of missing x-rays has little support. Perhaps, then, he was looking for the fragments on the wrong x-ray.

Perhaps he should have looked harder elsewhere. When one reads Custer's ARRB testimony, it's clear he pretty much skips over x-ray number 8, which shows the neck below C3-C4. Perhaps he'd been mistaken about the exact location of the fragments he remembered seeing; perhaps the fragments were instead in the region of C7 and T1, where others noted fragments. Or perhaps Custer saw the fragments exactly where he said he saw them, only on some other x-ray, like the A-P x-ray of Kennedy's skull, where Dr. Cyril Wecht claimed to see a fragment in a location corresponding to the high neck.

Yes, you read that right. It seems possible Dr. Wecht—who no one would call shy—actually noticed something of great importance in his first trip to the archives, and that this discovery has since been

overlooked. By everyone, including himself. In his April 1974 article in Forensic Science, in which he reported his conclusions after first viewing the autopsy materials, Dr. Wecht presented two illustrations of a skull, one showing the skull from the front and one from the side. Upon these skulls, the purported locations of the fragments on Kennedy's x-rays were depicted. Now, the subsequent publication of the x-rays shows that these illustrations aren't exactly accurate. And they're not even consistent.

Embarrassingly, the large fragment purportedly on the back of the skull is depicted far higher on the back of the skull in the illustration of the side view than on the illustration of the front view. Now, this may have been a simple over-sight, and a reflection that Wecht suspected the fragment near the top of the head on the lateral x-ray appeared behind the eye on the A-P x-ray, due to the A-P's being taken with the skull at an angle. But the drawing of the skull is not at such an angle, and depicting the fragment on the skull as if it were is quite misleading.

And, anyhow, that's beside the point.

No, what matters here is what Wecht depicts in the illustration of the front view: a bullet fragment on Kennedy's chin. In the legend, he writes "*There is the appearance of a very small particle on the right side of the mandible near the midline. No density corresponding to this location is seen on the lateral x-ray. Its location could be in the region of the spinal column and thus relate to the President's back wound.*"

Or not. Apparently, Wecht failed to realize that, should a fragment really be found near the spinal column at so high a location, it would almost certainly not "relate to the back wound," but to the wound low on the back of Kennedy's head.

Do you hear that, radiologists? That's history calling you YET AGAIN to do your homework, study the x-rays, and solve this thing...

Chapter 18: X-Ray Specs

A look at black and white and varying shades of gray, to see if they support or refute our new perspective

Skull X-Rays

The 'largest section of this missile'?

HSCA Exhibit F-55, the Anterior-Posterior x-ray, (A-P x-ray), which means it was taken from the front, with the x-rays heading towards the film at the back of his head.

The "next largest fragment"?

HSCA Exhibit F-52: the right lateral x-ray, which means it was taken from the right side, with the x-rays heading towards the film along his left side. Rotated 24 degrees backwards to match the A-P x-ray. (Kennedy's head was tilted back 30-35 degrees when the x-ray was taken.)

For reasons beyond my grasp, the first image in each chapter sometimes fails to appear. If there's nothing up above, don't despair; you can still see the image [here](#)

Skull X-rays

When one looks at the autopsy x-rays of President Kennedy, it is important to remember that they were made using portable equipment. This was due to the doctors' reluctance to move the President. This portable equipment was not first-rate, however, and some poor images came as a result. With that in mind, it's easy to understand how the autopsy doctors missed out on some of the details we now find so compelling. It is less easy to understand how the Clark Panel saw so much.

For starters, the Clark Panel, presumably under the influence of Dr. Russell Morgan, their one radiologist, claimed: *"a hole measuring approximately 8 mm in diameter on the outer surface of the skull and as much as 20 mm on the internal surface can be seen in profile 100 mm above the extreme occipital protuberance. The bone of the lower edge of the hole is depressed."* Well, why was the skull at the lower edge of the hole depressed? Since the Clark Panel proceeded to describe a large fragment at the back of Kennedy's skull, claiming it was *"embedded in the outer table of the skull close to the lower edge of the hole"* and the HSCA radiologists explained that this fragment, measured at exactly 6.5 mm, (the width of a bullet from Oswald's gun), was 1 cm below the depressed fracture, it follows

that the fragment was officially on a depressed section of bone as much as a centimeter below the alleged in-shoot on a non-depressed section of bone. How did this happen? Dr. Baden's testimony before the HSCA that this fragment was a piece of metal that "rubbed off from the bullet on entering the skull and was deposited at the entrance site " is thoroughly inadequate.

And why wasn't this fragment, presumably on the back of Kennedy's head, even mentioned in the autopsy report? The autopsy report mentioned two fragments removed from Kennedy's cerebral cortex but nothing about a large fragment embedded on the back of the skull. Dr. Humes testified, moreover, that they'd removed two fragments from behind the right eye. It seems possible then that they believed the bullet fragment on the back of the skull was behind Kennedy's right eye, and stopped looking for it when they found a smaller fragment. This is supported by the fact that the club-shaped fragment in the forehead readily visible on the HSCA's enhanced x-rays, which is widely believed to represent the fragment recovered at the autopsy, is basically invisible to the naked eye on the original, un-enhanced x-rays viewed by the doctors at the autopsy. The Clark Panel, tellingly, mentioned a large fragment on the back of the head but none near the forehead, specifying, in fact, that the trail of fragments in Kennedy's head ended "*just anterior to the region of the coronal suture,*" inches away from the forehead fragment.

It's reasonable to assume, then, that the failure of the doctors to mention this fragment in the autopsy report was some kind of mistake. While some have claimed the FBI's report of the autopsy proves the doctors lied about this fragment, a closer study of this report reveals this isn't true. The 11/26/63 Report of Agents Sibert and O'Neil states that "*X-rays of the brain...disclosed a path of a missile...the path of the disintegrated fragments could be observed along the right side of the skull...The largest section of this missile as portrayed by x-ray appeared to be behind the right frontal sinus...The next largest fragment appeared to be at the rear of the skull at the juncture of the skull bone.*" Those who believe the doctors lied take from this that the second fragment mentioned is a reference to the large fragment or slice found on the x-rays. I beg to differ. To me, it's more than clear that the first fragment mentioned is a reference to the "slice," and that the second fragment is a reference to a smaller fragment visible near the crown of the skull. I believe this for four reasons: 1) the small fragment near the crown is the second largest fragment visible on the x-rays; 2) it is indeed at the rear of the skull; 3) it is near a "*juncture*" in the skull, the sagittal suture along the midline, as revealed by the A-P x-ray; and 4) it is in the so called "*path of disintegrated fragments*" mentioned by the agents, while the large fragment is not.

Still, as the autopsy report failed to mention a fragment at the back of the head, and the Clark panel discussed it, the appearance was created that this fragment had been suddenly "discovered." As a result, an air of mystery developed around this fragment.

The nature of the fragment grew more mysterious with time. One of the Rockefeller Commission's consultants, Dr. Richard Lindenberg, amazingly, tried to dismiss the fragment as nothing unusual, reporting that "*the bullet became deformed when it entered the skull and lead was squeezed out of its base. One larger fragment lies outside and next to the lower margin of the entrance wound*" and then concluding "*The presence of a distinct exit wound also suggests that the bullet did not disintegrate within the cranial cavity but was only somewhat deformed. Disintegration must have taken place as it exited the skull.*" (Lindenberg thereby asserted that there was a large bullet fragment on the outside of the back of the head, but that the bullet didn't in fact break up until it exited from the front of the skull! Huh? As we've seen, this line of bull-okey was later repeated by Dr. Baden.) Some, including ballistics expert Howard Donahue, developed their own novel explanations of this fragment. Donahue believed, and convinced many others, that this fragment was the result of a ricochet.

When one reads about ricochets in such books as Vincent J. M. DiMaio's *Practical Aspects of Firearms: Ballistics and Forensic Techniques*, however, one finds that the bullets are flattened length-wise and that there is no record of them breaking into narrow cross-sections, or slices. As non-jacketed, lead bullets have been found to on occasion "pancake" on the back of men's skulls, however, some have said that the possibility remains that this "slice" on the back of Kennedy's skull was not a slice but a lead fragment of a bullet that ricocheted. (It's probably too small to be a "pancake" of a full-sized bullet.) Even this contention, however, is seriously undercut by DiMaio's research. On page 90 of *Practical Aspects* he has a chart indicating the expected level of deflection of bullets fired from various angles. According to this chart, a 6.5 mm full metal jacket bullet like those fired in Oswald's gun would have no appreciable deflection upon hitting smooth stone from 20-30 degrees above. If one is still convinced the fragment on the back of Kennedy's skull came from a ricochet then one should reflect that any shot fired from the sniper's nest towards President Kennedy and somehow ricocheting off the street to strike him would have to have magically avoided striking motorcycle officer James Chaney, riding slightly behind and to the right of the President.

Although he did not discuss this fragment in his 1978 HSCA testimony, HSCA ballistics expert Larry Sturdivan has in recent years developed his own theory about the fragment. He has concluded that, since it makes little sense for there to be a round fragment on the back of Kennedy's head, well, then there isn't one, and that what appears to be one is most probably an artifact, an error on the x-ray. (Sound familiar?) The one thing he says he's sure it isn't is a cross-section of a bullet, as he claims to have never seen a perfectly rounded piece of bullet jacket in a wound. He also shares the opinion of Dr. David Mantik (who, unlike Sturdivan, believes the fragment was deliberately added to the x-ray to make people think the shot came from behind) that the fragment seems to have greater optical density (whiteness, demonstrating thickness) when the x-rays penetrate its thin round face on the a-p x-ray, than when the x-rays penetrate it edge-wise on the lateral x-ray.

In 1979, however, the HSCA Forensic Pathology Panel concluded simply that *"The small missile fragment present at the margin of the entrance wound was probably a portion of the missile jacket..."* This avoided the conclusion suggested by the circular shape of the fragment--and the panel's conclusion that the nose and tail of the bullet ended up in the front seat--that it was just what their ballistics expert now swears it is not: a slice from the middle of the bullet sheared off upon impact by the oval entrance in the cowlick, 1 cm above, and lodged between the walls of the President's skull. When one considers that the fragment is, according to the reports of the Clark Panel and HSCA Forensic Pathology Panel, 6.5 mm in diameter, the same as a cross-section of the bullet, moreover, the conclusion that the fragment was a "slice" seems obvious.

That the panel was too scared to conclude what seems obvious, moreover, seems equally obvious. For, when one reflects that skull bone is made of three layers, an outer hard shell, a spongy middle, and a brittle inner lining, it makes little sense to believe that the middle of a bullet, while traveling at 1800 feet per second, would get sliced off upon entrance to the skull and end up in the spongy middle of the skull bone directly by the entrance. Since the nose of the bullet had purportedly created beveling, where through the outward dispersion of energy the hole in the brittle inner table was (according to the Clark Panel) two and a half times the size of the entrance hole on the outside of the skull, moreover, one can only wonder how this bullet slice found its way into the inner table. Did it Frisbee through space before lodging in the depressed segment of bone below? That no doctor has ever uncovered a comparable case, whereby a slice of a metal-jacketed bullet lodged between the walls of a skull near the point of impact, is not surprising. It just doesn't happen.

And so the HSCA FPP pulled the chicken switch and failed to conclude that the fragment on the back of the head was a slice of a bullet, and instead mumbled (if written words could mumble) that the fragment was "*probably*" a portion of the missile jacket, which just so happened to be circular in shape, and just so happened to be, according to their colleagues on the Clark Panel, the same width as a cross-section of the bullet. And, oh, by the way, they also concluded that this bullet, now shorn of this circular bit of jacket, continued on largely intact until "*striking the automobile, causing it to fragment into several pieces*" one of which was the nose of the bullet, and one of which was the to-all-appearances-intact base of the bullet.

In other words, they'd made clear the fragment was a slice without having the guts to say as much.

That something is wrong is further confirmed by the fact that the most visible supporters of the HSCA FPP's conclusions--Dr. Baden and single-assassin theorist John McAdams--still refuse to admit what is obvious--that their conclusions suggest the fragment was a slice from the middle of the bullet. Instead, Dr. Baden, in a high-profile appearance at the 2003 Wecht Conference, claimed that the fragment simply "*rubbed off*" the open base of the bullet. Huh? Well, at least this spurious explanation, which is in direct opposition to the findings of Baden's Pathology Panel, by the way, acknowledged that the fragment was not a slice incorporating both jacket and lead. Meanwhile, McAdams, apparently unable to process that the base of the bullet was found intact in the front section of the limousine, claimed (in a September 17, 2010 post on the alt.assassination.jfk newsgroup) that the fragment "*was almost certainly sheared off the base of the bullet.*" My God! What smoke!

More on this later.

Radiology Review

To properly understand the x-rays, there are a number of concepts one must keep in mind. The first and foremost concept is that an x-ray is a negative image reflecting the density of an object, and not its surface appearance. The areas of the x-ray film most exposed to x-rays are the darkest, and the areas least exposed, the whitest. Dense matter, such as bone or metal, will, of course, show up as white, while air will show up as black. A dark object or area is referred to as being radiolucent (meaning it is easily penetrable by x-rays), while a white object or area is referred to as being radio-opaque (meaning it is not easily penetrated). This established, we can begin to discuss the autopsy x-rays of President Kennedy, probably the least understood and most controversial element of the medical evidence.

We should start by killing some myths about the x-rays. After only a few days of research I found that the assertions of many conspiracy theorists, including Harrison Livingstone, that Kennedy's x-rays were inconsistent with the wounds described in the autopsy report, or even that they depicted a different person, were completely groundless. While Livingstone and others insisted that the dark shadows on Kennedy's right forehead area demonstrated that his right face was missing, I found that air in the tissues is to be expected in the x-rays of gun shot victims. In fact, I found a quite similar x-ray in the March, 1990 American Journal of Roentgenology. The caption of this x-ray reads: "*Note the pneumocephalus, calvarial fractures, and loss of brain parenchyma.*" Pneumocephalus means air in the brain cavity, calvarial fractures means fractures of the dome of the skull, and loss of brain parenchyma

means a loss of the brain's distinctive shape. Basically, this victim, as Kennedy, had had the right half of his brain turned to mush by gunfire, and had a quite similar x-ray as a result.

Should one think I'm exaggerating the obviousness of Livingstone's mistake, then one should consider that Drs Cyril Wecht and David Mantik offered a similar rebuttal to the "missing face argument" of Livingstone and others in the book *The Assassinations*, published 2003. They wrote: *"most of the x-rays in the beam are absorbed not by the bone, but rather by the brain itself. The dark area should instead have suggested to them that brain, rather than skull, was missing in this area."* While Wecht and Mantik, in turn, observed that Kennedy was laying on his back when x-rayed, and that the brain in such case would have settled to the back of his head, they also expressed doubt that the damage observed at autopsy was sufficient enough to explain why the brain had settled to such an extent. On this point, I suspect they are mistaken. The autopsy face sheet did make note that the falx cerebri, a covering of the brain, which helps keep it in place, was *"loose"* along the sagittal suture, which runs along the middle of the skull from the coronal suture on back to the occipital bone. An article in the August 2006 *Radiology* written by doctors from Dr. Finck's employer, the Armed Forces Institute of Pathology, moreover, made note that *"In eight of 10 subjects with gunshot wounds through the brain, the brain was settled in the dependent portion, and pneumocephalus was present in the nondependent portion of the calvarium... The brain in the remaining two subjects was extruded from the calvarium."* In other words, the doctors found that air was apparent in the frontal area of all ten of the high-velocity gunshot victims they'd studied. As a result, I suspect the air observed on the frontal area of Kennedy's x-rays is far from suspicious.

The March 1990 *American Journal of Roentgenology* offers another x-ray of interest. This lateral x-ray (taken from the side) depicts the remnants of a bullet in a victim's forehead after traversing the skull. As predicted in Spitz and Fisher's *Medico-legal Investigation of Death*, the copper jacket failed to exit. Of even more interest, however, is that there are a number of small fragments on the outside of the skull surrounding the bullet's entrance. As the bullet killing Kennedy is purported to have entered in this same region of the skull and to have broken up to a much greater degree, it makes absolutely no sense that the bullet supposedly making its entrance in the cowlick left no fragments around the outside of the entrance. None. Of course, there are those who've convinced themselves that a full metal jacket bullet can fracture upon impact and only begin to break up as it traverses the skull. That's like saying you can explode an egg through a window without getting any yolk on the window. No, it's worse than that. It's like saying you can explode an egg through a window and leave an egg-shaped hole in the glass, without getting any yolk, egg white, or shell on the window.

A second look at this lateral x-ray reveals that it is strikingly dissimilar to Kennedy's x-ray in at least one other way. While Kennedy's lateral x-ray is black towards the front and whitest towards the back, the x-ray in the periodical is, outside the bullet fragments, whitest where almost all other skull x-rays are whitest, the petrous bone sitting at the base of the skull.

Optical Density Comparison

HSCA Exhibit F-297:
pre-mortem x-ray of President Kennedy.

HSCA Exhibit F-52:
post-mortem x-ray of President Kennedy.

Three x-rays of the same skull exposed at 25, 50, and 100 milliamperes-seconds. Source: Medical Radiographic Technic.

Optical Density Comparison

When one compares Kennedy's lateral autopsy x-ray to other x-rays of its time period, including x-rays taken of his own skull before his death, one can see that something is indeed odd. The contrast between its white areas and dark areas is much greater than normal. The strange appearance of this x-ray, in fact, led Dr. David Mantik to conclude this x-ray has been altered.

Now, before one gets too excited about this, one should know that virtually every radiologist to comment on the x-rays, including those who believe the x-rays demonstrate the likelihood Kennedy was killed by a conspiracy, disagree with this conclusion. In Anthony Summers' December 2001 *Vanity Fair* article *The Ghosts of November*, for example, he cited Radiologist Dr. Randy Robertson, his colleague Patrick Burnett and Neuroanatomist Dr. Joseph Riley, among those who contend that the x-rays have NOT been tampered with. There is no comparable list of radiologists expressing the opposite opinion, and confirming Mantik's conclusions.

Still, Mantik's observations regarding the extreme contrast of the x-rays are valid and deserve some discussion.

To that end, we need to increase our understanding of how x-rays are created, and how Kennedy's x-rays could be so inferior. Dr. John Ebersole, the autopsy radiologist, gave a partial explanation to the HSCA when he told them *"I would like to explain one thing. These films, these x-rays were taken solely for the purpose of finding what at that time was thought to be a bullet that had entered the body and had not exited. If we were looking for fine bone detail, the type of diagnostic exquisite detail we want in life, we could have taken the x-rays in the x-ray department, made the films there, but we felt that the portable x ray equipment was adequate for the purpose; i.e., locating a metallic fragment."*

The portable x-ray equipment used at Bethesda was reportedly an old General Electric 250. The 1943 guidebook *Medical Radiographic Technique* by General Electric's Technical Services Division explains

"Defining contrast as the degree of difference in density between adjacent areas on the film, it is not difficult to recognize that gross-overexposure or under-exposure will affect this difference." It then offers: *"Technics should not be used to produce maximum contrast, but rather technics which will give satisfactory contrast for maximum visibility of structure."* The book thereby presents three x-rays of a human skull: one created with a short exposure that is too light; one created with a longer exposure that has an appropriate amount of contrast; and one created with an even longer exposure that is too dark.

It seems clear from looking at these x-rays and comparing them to Kennedy's that his x-ray was over-exposed. But it's also clear that something's wrong, as the contrast is far greater in Kennedy's over-exposed x-ray than in the examples in the book. The intensity of the whiteness towards the back of Kennedy's head is so great, in fact, that it appears few x-rays ever penetrated the bone in this location. This virgin whiteness, in turn, leads the solid bone around it to look grey, while forcing the areas without solid bone, the areas with air in the tissues, to look black.

Since the x-ray equipment had a chart which told the x-ray techs, Custer and Reed, how long to expose an image, based on the measurements of the object being x-rayed, one wonders how they could have screwed it up so badly. A partial excuse could be related to Reed's admission that, in order to prevent his having to re-do his work should there have been a mix-up developing the x-rays, he exposed two x-ray films at the same time, and boosted the energy level to compensate.

This is not just my assumption. On page 96, Medical Radiographic Technic shows three chest x-rays taken with different energy settings (with peaks of 50, 60, and 80 kilovolts). As you might guess, they show *"excessive," "satisfactory,"* and *"insufficient contrast,"* respectively. The book then claims *"Of the various factors affecting density and contrast in the radiograph, that most widely used is the x-ray tube voltage."* This, then, leads me to suspect that an improper combination of exposure time and energy setting caused the strange appearance of Kennedy's skull x-rays.

The thought also occurs that the unique structure of the skull, in which a fairly solid organ, the brain, is encased inside relatively thin layers of bone, only exacerbated the problems related to Custer and Reed's taking two x-rays at once.

I found confirmation for this thought in Manual of Roentgenological Technique, a textbook published in 1947. It notes that *"The more nearly the density of the part examined approaches that of the surrounding tissues, the more precisely must the kilovoltage or penetrability of the rays be selected in order to give proper differentiation of the parts. While higher kilovoltage produces greater penetration, lower kilovoltage values produce a greater degree of contrast in the structure of varying density. Over-penetrated roentgenograms present a grey lack of contrast and under-penetrated films show a chalky increase of contrast which is equally objectionable."* It seems possible from this that Kennedy's skull x-rays were both under-penetrated and over-exposed, and that this unfortunate combination led to their strange appearance. Perhaps Reed had failed to properly set the energy level. Perhaps, should one study numerous x-rays made with similar equipment, at various settings, one would find the peculiar appearance of Kennedy's x-rays not so peculiar at all.

This possibility is further supported by a book I picked up at a thrift store, almost as a joke. Textbook of Veterinary Diagnostic Radiology (1986) relates: *"The degree of blackening of the x-ray film is measured in terms of optical density. Optical density and film blackness are directly related...Of particular importance in patient radiography is the fact that x-rays are not absorbed homogeneously by the body; some tissues absorb x-rays more efficiently than others. This phenomenon is called differential absorption...it is important to recognize that the degree of differential absorption of x-rays by the patient is a function of x-ray energy. As the energy of x-rays increases, so does their penetrability. Thus, when higher energy x-rays are used, the lesser is the degree of differential absorption by the patient. When lower energy x-rays are used there is more difference between the*

radiopacity of bone and soft tissue."

And should one think my quoting a book on veterinary radiology inappropriate, one should know that I've confirmed this point in more appropriate textbooks as well. Limited Radiography (1999), for example, holds that:

"A diagnostic quality radiograph should have adequate density (blackness), good contrast (range of gray shades), clear recorded detail (definition and resolution), and no visual distortion or magnification (size and shape) of the anatomy being examined... Production of the visible radiographic image is controlled by the following exposure factors: milliamperage, kilovoltage peak, and source-to-image distance... The two major photographic factors of the image are 1) density and 2) contrast. Density is seen as the overall blackness of the total image. Density is controlled by milliamperage-seconds... The density of the radiograph is directly proportional to the amount of milliamperage used for exposure and length of time the exposure is delivered (referred to as milliamperage-seconds setting)...Density is directly proportional to milliamperage and time... Distance, or source-to-image distance has a significant influence on density... Simply put, the radiation beam diverges and proceeds in a straight path... The area covered becomes increasingly larger with lessened intensity as the beam of radiation travels a greater distance from the source... Contrast is the second major photographic factor... Radiographic contrast results from the distribution of black metallic silver in the film emulsion and is directly controlled by the penetrating effects of kilovoltage. Radiographic contrast is visualized in the image as gray tones or degrees of gray that reveal the differences between body organs or tissues. Contrast enhances information... Contrast is controlled by the kilovoltage or, more technically, the quality of energy or wavelength (short or long)... A variety of long and short wavelengths (low and high energies) will demonstrate a range of shades from black to gray to white (gray tones) and their density differences. The differences are easily seen in the structures visible in the radiographic image... Radiographic contrast is generally referred to as the overall contrast seen in the image. It includes long-scale (more gray tones) contrast and short-scale (more black and white tones) contrast. Radiation of higher energy (shorter wave-length), 70 kilovoltage peak or more, will produce long-scale contrast with many gray tones... If there are large differences in the thickness of body structures, e.g., bone vs. soft tissue, or if 70 kilovoltage and lower is used, short-scale contrast with more pronounced black and white tones will be produced... the degree of density is proportionate to the milliamperage-seconds...By comparison, contrast is controlled by kilovoltage peak... It should be noted that although kilovoltage peak and milliamperage seconds have an interactive effect in increasing or decreasing contrast and density respectively, they may not be interchanged to compensate for the lack of one or the other... if structures are underpenetrated due to a lack of kilovoltage peak, no amount of milliamperage-seconds increase will improve the penetration; added milliamperage-seconds will only add density... Conversely, if an image is underexposed and lacks density, milliamperage-seconds must be added; kilovoltage peak would add only scattered radiation and thus cause the image to look gray and flat without clarity."

It seems quite possible, then, that Kennedy's x-rays were under-penetrated and overexposed, and that this caused their unusual appearance. And yet... Dr. Mantik, who is by trade a radiation oncologist, and not a radiologist, has failed to address the possibility. In a quick study of his statements on the the x-rays online and in books, I found a reference to his comparing the x-rays to one of Kennedy while alive, to those of his own patients, and to 19 x-rays of gunshot wounds to the head, courtesy Dr. Doug DeSalles. (Curiously, in his summary of Mantik's studies in his book Inside the ARRB, Doug Horne reports this last number as 9.) In all Mantik's writings, however, I found no reference to his ever attempting a comparison to x-rays taken with the equipment used on November 22, 1963, at various settings. While Mantik presents photos of Kennedy's computer-enhanced x-rays to make his claim there's too much contrast, furthermore, he fails to tell his audience that these x-rays were computer-

enhanced for the HSCA. In fact, in looking back through a half dozen or so of Mantik's writings and appearances, I've been unable to find a confirmation that the Optical Density measurements he finds so incriminating were those of the original x-rays, as opposed to the computer-enhanced x-rays shown his audience.

This, then, suggests the additional possibility that the unusual optical density measurements so decried by Mantik stem not from the x-rays having been faked, as he concludes, but from the computer-enhancement performed for the HSCA. As a consequence, then, of both Dr. Mantik's failure to address the possibility the x-rays were improperly created, and his failure to acknowledge that the x-rays he presents have been computer-enhanced, I must admit that I, as fellow buffs Dr.s Robertson, Riley, and, as I've been led to believe, Wecht, find Mantik's conclusion the x-rays have been altered premature, and unconvincing.

Memo to Mantik

In June 2011, on the CTKA website, Dr. Mantik responded to my criticisms and analysis. He addressed my doubts about the significance of his OD measurements in his usual dismissive manner. After asking himself if he'd used the enhanced x-rays for the OD measurements, he responded *"No--definitely not. This is an eccentric charge by Speer."* He reacts, of course, as though I'd "charged" him with using the enhanced prints for his measurements when, as you've just read, I merely claimed his behavior "suggested the possibility." He then attempted to explain his behavior. He asserted that he'd always printed the enhanced prints when discussing the unenhanced x-rays *"because the prints of the unenhanced x-rays do not accurately portray the extant x-rays"* and that *"In print format, the enhanced x-rays are closer in image content to the extant x-rays."*

Yes, you read that right. He admitted that his misrepresentation of the enhanced x-rays as the x-rays he'd studied and measured was not only not accidental, but premeditated. He then defended his actions with an equally surprising claim. He insisted *"Given a choice of viewing the extant x-rays or the enhanced prints, most experts would prefer to see the x-rays. The enhanced prints were produced primarily because they more accurately reflect the x-ray images (than do the unenhanced prints)."* Yes. He went there. While, earlier in his article, he'd offered *"The HSCA, of course, enhanced the X-rays, but I suspect that was mostly to obtain useful prints for publication. (Printing changes the contrast),"* he now committed himself. To support his claim the prints of the enhanced x-rays more accurately depict the original x-rays than do prints of the originals, he had actually claimed that's why they were created.

Well, this was nonsense. Mantik offered no support for this claim, and none is readily available. In his report on the x-rays, in Addendum C to the report of the HSCA Forensic Pathology Panel, HSCA Radiology consultant Dr. G.M. McDonnel related that he'd first viewed the x-rays (radiographs) on March 7, 1978, and that afterward *"At my suggestion portions of these radiographs were digitized and enhanced for further observation and analysis."* After presenting his findings, moreover, McDonnel concluded *"The digitized and enhanced images produced by Aerospace Corporation permitted definitive observation and analysis of the original radiographs. Further, enhancement permitted analysis or elimination of artifacts on the images. The most vivid result is the clear definition of the multiple fractures radiating from the area of the entrance of the penetrating missile in the right occipital bone."*

That's right. McDonnel stressed that the enhanced x-rays were created to help him in his analysis, and that, furthermore, they were of help. He said nothing about how the enhanced x-rays better reflected the originals when printed, or that enhancement of the x-rays could be of help when publishing the report of the pathology panel (for the handful of people who would ever see it prior to its availability on the internet). Mantik's suggestion of as much is thus exposed as smoke. While he, in his 2011 response to

my criticisms, expressed dismay that I'd failed to ask him if he'd measured the enhanced or unenhanced x-rays, his response justifies my reason for not doing so. I hate being lied to, or being fed such nonsense that it *feels* like I'm being told a lie.

My distrust of Mantik, unfortunately, only grows stronger. In September 2011, while browsing through the Harold Weisberg Archive, I came across Authenticity of the JFK Autopsy X-rays, a June 1995 essay by Mantik in which he reversed himself (if only briefly) and argued that the x-rays in the archives were in fact unaltered. Well, near the end of this essay is a revealing passage...quite revealing, in my opinion. In this passage, Mantik notes that the x-ray tech at Kennedy's autopsy, Jerrol Custer, had been shown Kennedy's x-rays, and had said that they do not look authentic. He then offers *"I suspect that what troubles him is the remarkable difference in contrast between the prints and the original X-rays. I know that several of us, who had repeatedly viewed only prints of the X-rays, have been somewhat surprised, when first viewing the X-rays, at the lesser degree of contrast seen there."*

Well, I'll be. In 1988, KRON broadcast an interview of Custer, in which he was shown prints of the x-rays of Kennedy's skull, and claimed they did not match his recollections. Custer claimed it was the substance of the x-ray that was the problem, and said nothing of the contrast. He was, tellingly, shown the enhanced prints of the x-rays. In 1993, in his book *The Killing of a President*, moreover, Robert Groden published the largest and clearest images of the x-rays yet published, and reported: *"Technician Jerrol Custer took the X-ray pictures on the night of the autopsy. These X-rays, purportedly of the President's head, do not depict the true nature of the President's wounds. Custer has stated that the pictures shown here are not the x-rays he took that night."* These were, once again, the enhanced prints. There is no evidence that Custer had, by 1995, ever been shown the unenhanced prints of the x-rays.

Now, if the enhanced prints look more like the originals than the unenhanced prints, as Mantik now claims, why would he have claimed in 1995 that Custer's confusion stemmed from the *"remarkable difference in contrast"* between the prints seen by Custer and the originals? Had Mantik incorrectly assumed that Custer had exclusively been shown unenhanced prints?

Well, no, that doesn't work either. In 1995, Mantik claimed that people viewing the unenhanced original x-rays were surprised by their *"lesser degree of contrast"* than the prints available to the public. This suggests--assuming, of course, that the prints he is referring to are the unenhanced prints--that the printing of these x-rays had increased their contrast. Well, in 2011, he turned around and claimed that he believed the HSCA had enhanced the prints in order *"to obtain useful prints for publication,"* and that, as a result, these prints looked more like the unenhanced originals than prints of the unenhanced originals. Yikes. For him to be consistent, then, he'd have to believe that the "enhancement" of the x-rays *reduced the contrast* of the x-rays, so that their appearance once printed more closely conformed to the appearance of the original x-rays as viewed with the naked eye.

And that makes no sense...

This leads me to suspect, then, that, when Mantik wrote *"I know that several of us, who had repeatedly viewed only prints of the X-rays, have been somewhat surprised, when first viewing the X-rays, at the lesser degree of contrast seen there"* that the prints he had up until that time viewed repeatedly had been the enhanced prints published in conspiracy books, and not the unenhanced prints published in the HSCA report. Mantik had been studying the x-rays for years, and had, apparently, not realized that the x-rays in the books that looked inauthentic were computer-enhancements performed for the HSCA, and not prints of the originals.

Now, to be honest, the concept of "contrast" is a confusing one, and the word "contrast" is often used in contradictory ways. One radiologist e-mailed some years back after reading an earlier version of this chapter. He objected to my use of the word "contrast." He said *"To me 'contrast' means the ability to distinguish things close together in physical density and this happens in the sweet spot of the film"*

where there are lots of shades of gray. The sweet spot is not very wide and has to be placed on the area of interest. For example the area of the lateral view of the skull where the brain has been blown or sucked out is overexposed in my terminology (while the exposure toward the rear looks OK) and all the shades of gray have been wiped out up front and I would never say that view had too much contrast..."

Well, this is interesting. I had used the word "contrast" in order to be consistent with the General Electric guidebook. Perhaps, then, Mantik has at one time or another shared this radiologist's interpretation of the word "contrast." If so, however, wouldn't he have insisted from the beginning that the original x-rays showed a greater degree of "contrast" (shades of gray) than the published prints, instead of the opposite?

Yes, there's no getting around it. In his attempt to explain his repeated misrepresentation of the enhanced x-rays as the x-rays he'd measured, Mantik has either said something that simply isn't true or "enhanced" the truth by telling a big whopping lie.

Now, let's take a look at these "enhanced" x-rays...

Computer-Enhanced X-rays

When one looks at the computer-enhanced prints of the x-rays released by the HSCA (or at least the photos published of these prints), one comes to a quick realization. There is a bullet fragment visible on both the AP x-ray and lateral x-ray, in the President's forehead, above his right frontal sinus. There were two fragments removed at autopsy, one large one from behind the right frontal sinus, and a smaller one nearby. Well, if this is the larger fragment, where's the smaller one? And, if this is that fragment, what

of the even larger fragment seen on the A-P x-ray? In the sections above, I've surmised that the doctors went looking for that fragment, later determined to be on the back of Kennedy's head, and stopped when they found this club-shaped fragment in his forehead. Well, the enhanced x-rays show the two fragments to have been of radically different proportions. Could they really have been that mistaken? Or is there a better explanation?

When one reads the reports of the HSCA's radiology consultants, Dr.s McDonnell and Davis, included in Vol. 7 of the HSCA's report, one finds even more to ponder. Much of what they said fails to support the conclusions of the forensic pathology panel. In fact, if one reads closely, one can find substantive support for our operating premise that a bullet broke up on the outside of Kennedy's skull above his ear.

First of all, neither of the two doctors mentioned the large entrance hole at the back of the head described by the Clark Panel. Second of all, Dr. David Davis said he believed the fractures at the back of Kennedy's skull emanated not from the HSCA's in-shoot but from the bullet slice itself. Since it simply makes no sense for a bullet to enter half-way into a skull, break-up, and have a slice from its middle lodge within its in-shoot, (particularly as the tail of the bullet struck the windshield only a few feet from its nose), a better explanation is needed. Third, when Dr. Davis discussed what he proposed was a trail of fragments stretching from a location some 6 centimeters above and in front of the supposed entrance wound in the cowlick along the mid-line of the brain towards the President's forehead, he admitted that the largest of this supposed trail of fragments (the one high up near the crown of his head) appeared to be "*outside the intracranial space.*" This makes absolutely no sense if the large defect was solely an exit! I mean, how could bullet fragments speeding through a skull at hundreds of feet per second reverse themselves and attach themselves to the outside of the skull at a location inches back towards the entrance? Dr. Davis himself admitted: "*It is impossible to work this out entirely.*" That this fragment didn't come as a result of the impact at the in-shoot is refuted by the small size of the entrance wound, which would have been truly impossible if the bullet had exploded in half on the outside of the skull at that location. Furthermore, since the reported trajectory of these fragments within the brain doesn't follow the HSCA's trajectory of the dissolving bullet, which they believed headed 18 degrees left to right within the skull and exited en masse (in order to create the large skull fractures apparent near the temple), it's clear a better explanation is needed here as well.

Although not mentioned by the radiologists, the x-rays give us yet another reason to believe a bullet impacted on the side of Kennedy's head, above his ear. Take a close look at the lateral x-ray above. A fracture line running from the area of the supposed in-shoot in the cowlick confirms something happened in that area; this fracture line, however, comes to a complete stop after intersecting a fracture line coming from the large defect near the temple.

Well, what's the significance of this, you might ask? Well, only that the large defect preceded whatever occurred near the cowlick. Don't believe me? Then one should consider this passage by Dr.s James Messmer and B.G. Brogdon in chapter 18 of *A Radiologic Atlas of Abuse, Torture, Terrorism, and Inflicted Trauma* (2003): "*Determination of entrance and exit wounds in the skull is assisted by the rule of intersecting fractures, which states that a linear fracture from an earlier blow will stop propagation of a fracture from a second blow.*"

And should that not be clear, one should also consider this passage from *Forensic Neuropathology: A Practical Review of the Fundamentals* (2007): "*Cranial gunshot wounds produce primary (and sometimes secondary) radiating gunshot wounds that extend from the entrance wound outward. It has been established that these radiating fracture lines develop faster, and thus are already present, when a*

bullet exits the skull. Radiating fracture lines from the exit will, therefore, stop at the preexisting fracture lines caused by the entrance wound, allowing the entrance and exit wounds to be distinguished by this skull fracture pattern irrespective of beveling characteristics of the entrance and exit wounds."

When one studies other textbooks and forensics journals, moreover, one finds that the belief fractures stop when they encounter pre-existing fractures dates back to 1903, when first proposed by a German pathologist named Puppe. Puppe's Rule, as it has come to be known, has been accepted ever since. There is nothing controversial about it. The Oxford Handbook of Forensic Medicine, 2011, notes *"Puppe's Rule is that fracture lines resulting from the second injury will not cross those from the first, thereby helping identification of which fracture occurred first. The rule has been recently applied to analysis of radial fracture lines caused by multiple bullet wounds to the head."* And yet, not one of the Clark Panel, Rockefeller Commission, and HSCA's radiology consultants mentioned that, "Oh yeah, the x-rays demonstrate that Kennedy's supposed exit wound by his temple pre-existed his supposed entrance wound in the cowlick."

Now, that's not to say that no one noticed. According to notes taken by Doug Horne, Dr. Douglas Ubelaker, the forensic anthropologist consulted by the ARRB in 1996, *"observed that one fracture line occurred prior to the other, because the longer one stopped the shorter one."* While Horne's notes failed to reveal which lines intersected, and which came first, one look at the x-ray makes this pretty obvious.

Clearly, a better explanation is needed!!

So here it comes... Dr. Donald W. Marrion, in 1999's Traumatic Brain Injury, describes: *"In some instances, a bullet disintegrates when it hits the skull at an angle, sending multiple fragments into the scalp and thereby having the appearance of a shotgun wound on plain skull radiographs."* If we assume Kennedy was struck in such a manner at frame 313 of the Zapruder film, of course, it correlates Dr. Davis' observation that the fragments appeared to be in the scalp with Dr. William Kemp Clark's observation and testimony that Kennedy's large head wound appeared to be a tangential wound. It appeared to be because it was.

That Dr. Davis was agreeable to this conclusion is confirmed by a 12-22-78 letter written to the HSCA. In response to their question of whether the x-rays were consistent with a shot being fired from the grassy knoll, he wrote: *"the only possible occurrence would have required President Kennedy's head to have been tilted to the left side, that is, with the right ear elevated and the left depressed...in order to justify our potential explanation that a tangential blow might have been struck to the right top of Mr. Kennedy's skull at about the same time the posterior missile entered."* Dr. Davis then haggled about the exact trajectory needed for this to work, and concluded *"If the films of Mr. Kennedy's head at the time of the impact do not show such a tilt, I think that it is completely reasonable to assume that there was no possible head wound from the right side."* Dr. Davis had thereby confirmed that his problem with such a shot did not come from his study of the x-rays, but from the assassination films, and that the x-rays were completely consistent with the large defect's having been created by a tangential blow.

Those studying the x-rays at autopsy, in fact, suspected such a blow. On 3-11-78, the radiologist at the autopsy, Dr. John Ebersole, in testimony originally slated to be sealed for fifty years, discussed his opinions regarding the fatal head shot with the HSCA medical panel. He told them: *"In my opinion it would have come from the side...I would say on the basis of those x rays and x rays only one might say one would have to estimate there that the wound of entrance was somewhere to the side or to the posterior quadrant."* Such a wound is most assuredly not the small wound on the back of the head by

the EOP.

There were others at the autopsy who shared this assessment. When discussing the back of the head in the lateral x-ray, radiology tech Jerrol Custer testified before the ARRB *"you see the fragmentation, how it starts to get larger and larger and larger...The brain has been pushed back, and it pops the skull out."* When asked then if this meant the trauma began at the front and moved towards the back of the head, Custer clarified *"Yes, absolutely."* An HSCA report on an interview with Dr. Humes' and Dr. Boswell's assistant at the autopsy, James Curtis Jenkins, reflects a similar opinion: *"He said the wound to the head entered the top rear quadrant from the front side."*

Jenkins would later clarify his thoughts. As recounted in High Treason 2, in 1990, he told Harrison Livingstone that *"just above the right ear there was some discoloration of the skull cavity with the bone area being gray and there was some speculation that it might be lead."* When then asked by Livingstone if this might have been an entrance, he replied: *"Yes, and the opening and the way the bone was damaged behind the head (it) would have definitely been a type of exit wound."* In an interview with William Law, published in Law's book In the Eye of History (2005), moreover, Jenkins stood by this assessment. About Humes and Boswell, he related *"They were speculating about a lot of things."* When asked about what, he continued *"Well, about a hole actually above the right ear. The speculation was that it had some gray substance on it and of course the speculation at that point in time that it was from a bullet."* When asked if they came to a conclusion regarding this hole, he responded *"No, I think--from my assumption--that it was an entry wound."* He then acknowledged that *"Later on I was told there was a wound below the nuchal line on the back of Kennedy's head"* and that even so *"I came out of the autopsy that night and I was sure that the bullet entered the right side of the head and exited in this area"* (at which point he pointed above his right ear).

As none of these men noted a separate entrance and exit for the large head wound they observed, it seems clear they were describing a tangential wound impacting on the side of Kennedy's head at the supposed exit defect. It follows then from this that they were either unaware of the small entrance wound near the EOP discussed in the autopsy report or of the impression the small entrance wound near the EOP discovered at the autopsy did not correlate with the large defect more readily observed at the top of the head, and that there was more than one head wound.

While undoubtedly problematic for the single-assassin conclusion, the assumption that the shot striking Kennedy at frame 313 was a tangential blow nevertheless makes sense out of all sorts of nonsense. It explains why the President's skull fragments shot upward from above and forward of Kennedy's ear, but not from the purported entrance in the hairline, and why the four major scalp lacerations described in the autopsy report all began at the large defect, and none at the supposed entrance. It removes the messy proposition that the bullet traversing Kennedy's skull changed directions upon exit before striking the windshield, and replaces it with the far more likely assumption that the bullet was deflected after breaking up on Kennedy's skull, and then struck the windshield. It explains, moreover, why the crumpled nose of this bullet was found to have been covered with human skin, a recently-discovered fact that is completely at odds with the official theory that this bullet entered through a small hole in the back of Kennedy's head and tumbled through 4 inches of brain matter.

The "Trail of Fragments"

Should one still not be convinced, then perhaps one should look at the scalp fragments more closely. Such an inspection will reveal that the bullet fragments purportedly leading across the brain project into the upper right quadrant of the brain, an area of the brain the doctors claimed was missing. Dr. Humes, we should recall, had testified before the Warren Commission that *"The greatest loss of brain substance was particularly in the parietal lobe, which is the major portion of the right cerebral hemisphere"* and that *"The base of the laceration was situated approximately 4.5 cm. below the vertex."* More to the point, Dr. Boswell had testified: *"the top of his head was blown off. A 14-centimeter segment of it was blown off. And it was on the right side of his brain that the brain was missing."* That the supposed trail of fragments on the x-rays were not even in the brain, and appeared "to be suspended in midair," moreover, was proposed by Dr. Mantik long before I, and reported in Harrison Livingstone's 1993 book *Killing the Truth*. Got to give credit where credit is due.

When one looks real close, furthermore, it appears that some of the fragments appear to be where even skull is missing. Since the ballistics expert at the autopsy, Dr. Finck, reported to his superiors in the Army that *"many metallic fragments were seen on x-ray films, but only two were recovered,"* and that his post-autopsy examination of the removed brain revealed no metallic fragments, only bone fragments, it seems reasonable to assume that the bulk of these bullet fragments were in the President's scalp or hair, and not within his skull. As the doctors, under the reasonable impression the President was slated for an open-casket funeral, were understandably reluctant to shave his head, and as Dr. Finck, the one member of the autopsy team with experience with bullet wounds, arrived after the removal of the brain, it seems reasonable as well to assume that Humes and Boswell simply peeled back Kennedy's scalp without inspecting it, and then rushed through the unappetizing business of searching the President's skull for bullet fragments. When Humes' testified about this inspection before the Warren Commission, after all, he admitted that: *"in this area of the large defect we did not encounter any of these minute particles. I might say at this time that the x-ray pictures which were made would have a tendency to magnify these minute fragments somewhat in size and we were not too surprised in not being able to find the tiny fragments depicted in the x-ray."* So, NO particles from the supposed "trail of fragments" were found on the interior of the skull near the supposed exit.

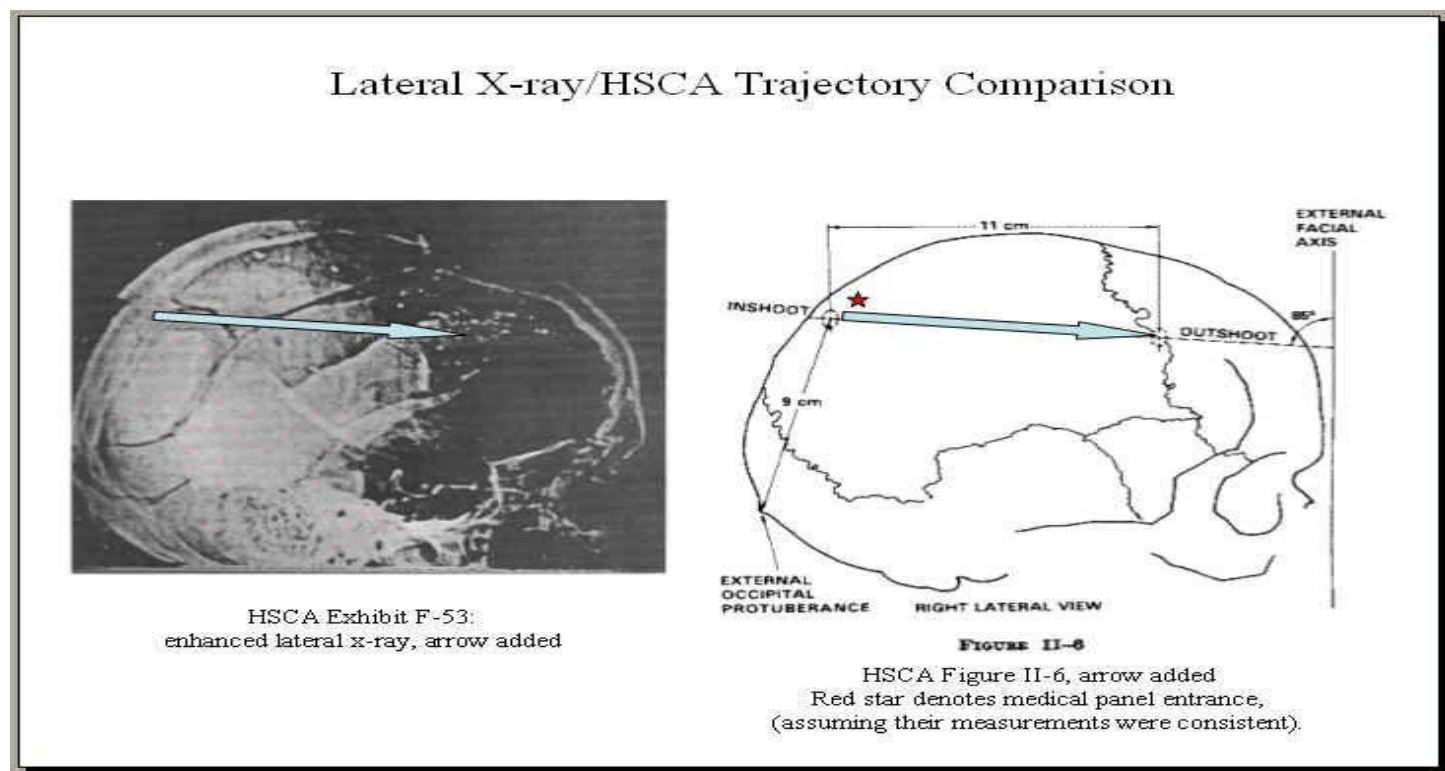

Unfortunately, Dr. Humes' inability to find these fragments failed to prevent him from citing them as support for his theories. In the autopsy report Humes claimed that a bullet entering near the hairline deposited *"minute particles along its path"* from the entrance near the EOP to the right forehead. The Clark Panel and HSCA both claimed this same trail of fragments, when projected backwards, led to the in-shoot in the cowlick. In fact, virtually all of the fragments are well above both Humes' proposed path and the path first proposed by the Clark Panel. (When asked about this by the Rockefeller Commission, Clark Panel leader Russell Fisher's co-author and pal Dr. Werner Spitz explained that the right side of the skull was displaced on the x-rays and that *"if this were all placed back in its original location...then that dispersion of metal fragments which indicates the wound track comes into perfect alignment..."* Yeah, okay. Funny how the rest of the x-ray seemed in perfect alignment, and how only the top inch or two of the right side of the skull was lifted an inch or two compared to the left side...)

Anyhow, the supposed "trail" of fragments makes little sense when one notes that the energy and particles of a disintegrating bullet are believed to fan out in a cone. Since the HSCA radiology consultant Dr. David Davis acknowledged in his report that *"the metallic fragment pattern that is present from some of the metallic fragments located superiorly in the region of the parietal bone, or at least projecting on the parietal bone, are actually in the scalp,"* we have good reason to believe a bullet broke up on the outside of the skull at a point further forward than the cowlick. In support, it should be noted that one of the men who did inspect Kennedy's scalp, mortician Tom Robinson, when asked about the fatal bullet by the HSCA staff, stated his assumption that *"It exited in many pieces,"* and then

explained, *“They were literally picked out, little pieces of this bullet from all over his head.”* In further support, moreover, we can go back to the statements of autopsy assistant James Curtis Jenkins, and recall that in the exact spot where he claimed the doctors discovered a gray discoloration of the skull, Dr. Davis saw metallic fragments, which he assumed were in the scalp. A gray discoloration of the skull of course suggests the presence of lead. Lead is of course a metal. Two plus two equals four.

When one realizes that the largest fragments of an exploding bullet travel the furthest, and that the two largest fragments discussed at the autopsy were on the opposite ends of Kennedy’s skull and equidistant from our proposed entrance, and adds this to the fact that, defying expectation, there were no small fragments surrounding the supposed in-shoot in the cowlick, then one should rightly conclude that the lateral x-ray demonstrates convincingly that a bullet broke up near the site of the supposed out-shoot, above the right ear. I’d bet everything I have on it. And have.

But there are always those who disagree. Larry Sturdivan offers an explanation as to how all the fragments from the bullet he now proposes entered low on the skull ended up at the top of Kennedy’s head. He writes: *“Many of the fragments deposited in the President’s brain were flushed out, along with the brain tissue, as the large amount of blood flowed out of the explosive wound in the side of his head, in the car and in Parkland. It is evidently some of these that were deposited in the bone flaps by clotting blood that show as a “trail” of fragments near the top of the lateral view.”* Sounds good. But does this really make sense? I mean, if these fragments were all on bone flaps, which is doubtful, and were held in place by “clotting blood,” wouldn’t these fragments slide to the back of Kennedy’s head once he lay firmly on his back? The x-rays, after all, were taken more than 8 hours after Kennedy’s head exploded. Certainly, Sturdivan doesn’t believe Kennedy’s casket was shipped on end.

Lateral X-ray/HSCA Trajectory Comparison

When one compares the lateral x-ray to the trajectory drawings of the skull prepared for the HSCA

trajectory analysis, one finds that not only is the supposed trajectory far below the purported “trail of fragments” but that the supposed outshoot, as discussed earlier, appears to be below the cluster of fragments, on bone. If this is true, of course, this means that the trajectory analysis plotted an in-shoot where there was no in-shoot, to an outshoot where there was no outshoot. I’m not kidding.

When one looks at the purported in-shoot near the cowlick on the trajectory drawing one can see that although the in-shoot was supposedly only 1.8 cm from the middle of the back of Kennedy’s head, this would still project slightly inwards from the back of Kennedy’s head when viewed laterally, due to the rounded nature of the skull. When one looks at the x-ray, however, one sees that there is no clear-cut entrance at this location. That this entrance was hard for even trained experts to locate can be revealed by reading the various reports written for the Clark Panel, Rockefeller Commission, HSCA, and ARRB. To put it mildly, they lack consensus. Here is a brief summary...

February, 1968. Dr. Russell H. Morgan, the radiologist on the Clark Panel notes in its report that *"On one of the lateral films of the skull, a hole measuring approximately 8 mm in diameter on the outer surface of the skull and as much as 20 mm on the internal surface can be seen in profile approximately 100 mm above the external occipital protuberance. The bone of the lower edge of the hole is depressed."* This places the hole in a section of parietal bone that presumably fell to the table when the doctors peeled back the scalp and NOT in the occipital bone near the hairline where the doctors claimed to have seen a beveled entrance. Morgan also notes that *"embedded in the outer table of the skull close to the lower edge of the hole, a large metallic fragment"* can be observed and that *"on the antero-posterior film"* this fragment *"lies 25 mm to the right of midline."* This suggests the fragment is in the depressed bone below the entrance. He then notes *"This fragment as seen in the latter film is round and measures 6.5 mm in diameter."* As the ammunition found in the assassination rifle measured 6.5 mm, this suggests the fragment was a cross-section of the bullet. Morgan then offers that *"Immediately adjacent to the hole on the internal surface of the skull, there is localized elevation of the soft tissues. Small fragments of bone lie within portions of these tissues and within the hole itself."*

January, 1972. Dr. John Lattimer, a urologist, becomes the first independent examiner of the autopsy photos and x-rays. He would later be asked to testify for the Rockefeller Commission. In his article on his examination, published in the May 1972 issue of Resident and Staff Physician, Lattimer presents his conclusions. These conclusions are not truly independent, however. In the article, he admits that a *"top roentgenologist, Dr. Russell H. Morgan,"* had previously reviewed the x-rays, and had *"issued a technical report about them, couched in proper medical terms."* This is a reference to the report of the Clark Panel. Lattimer then adds *"The author wishes to fully acknowledge this report by forensic experts."* Throughout the article, moreover, Morgan's influence is obvious. In his depiction of Kennedy's wounds, Lattimer depicts a bullet entrance high on the back of the head and notes *"The ovoid 'wound of entry' was fairly high up on the back of the skull, well above the hairline, where the skull was starting to curve forward, and about 10 cm above the occipital tuberosity... The bone at the lower margin of the hole was depressed slightly and the wound in the inner table was characteristically larger than the wound in the outer table (cone shaped), exactly as one would expect from a 'wound of entrance' into the back of the skull."* He then asserts *"A (6.5 mm diameter) fragment of the bullet had been shaved off by the sharp edge of the thick bone of the skull and was embedded in the margin of the wound of entrance."* That Lattimer was simply regurgitating the Clark Panel's report is suggested, moreover, by the fact Lattimer changed his opinion late in life, and ended up believing the bullet entrance on the back of the head was low on the head, as proposed in the autopsy report.

August, 1972. Dr. Cyril Wecht, a forensic pathologist, becomes the first independent forensic pathologist to view the autopsy photos and x-rays. He would later testify for the Rockefeller

Commission and function as a member of the HSCA Forensic Pathology Panel. As reported by writer David Lifton, who accompanied Dr. Wecht to the Archives, Wecht can't find a bullet entrance on the back of the head on the x-rays. For his April 1974 article on his examination, however, Wecht appears to take a cue from Dr. Lattimer, and defers to Dr. Morgan. On Wecht's depiction of Kennedy's skull, as viewed from the side, he presents *"a sizable fragment"* on the back of the head *"at the lower margin of the hole of presumed bullet entry."* In the text he then claims that from viewing the autopsy photos and x-rays *"one entry wound is definitely identifiable...high on the rear of the skull."* That Dr. Wecht was not an expert on x-rays, and was simply deferring to Morgan, is supported, moreover, by the fact Wecht later co-wrote an article with Dr. David Mantik in which they claimed that the small fragment on the back of the head in the lateral x-rays was too small to be the large fragment on the A-P x-ray.

April, 1975. Dr. Werner Spitz, a forensic pathologist closely associated with the Clark Panel's Dr. Fisher, and a member of both the Rockefeller Commission Panel and HSCA Forensic Pathology Panel, views the autopsy materials. In his report, he notes *"The missile which struck the right side of the President's head penetrated approximately 10 cm above the occipital protuberance and 2 1/2 cm to the right of the midline."* These are the exact measurements offered by the Clark Panel. As a result, it seems more than likely Spitz was yet another deferring to Morgan's opinion regarding the wound location. Even so, it's interesting that in Spitz's 6 page report for the Rockefeller Commission he never mentions the large fragment apparent on the x-rays. Instead, he claims, weakly, that *"Nothing in the evidence which I have viewed tends to conflict with my opinion that the two shots which struck the president could have come"* from the sniper's nest.

April, 1975. Dr. Richard Lindenberg, a neuropathologist on the Rockefeller Commission's Panel, and another close associate of Dr. Fisher's, views the autopsy materials. He appears to have been yet another to rely on Fisher's and Morgan's conclusions, and notes in his report that a *"circumscribed defect in the posterior parietal bone which has the characteristic of an entrance hole"* is apparent on the lateral x-ray. He then claims a bullet *"hit the right side of the head of the president approximately 2.5 cm from the midline and 10 cm above the occipital protuberance."* He notes further that the *"bullet became somewhat deformed when it entered the skull and lead was squeezed out of its base. One larger fragment lies outside and next to the lower margin of the entrance wound."* Apparently, he felt Lattimer's conclusion the fragment had been "shaved" from the bullet was inaccurate.

April, 1975. Dr. Fred Hodges, the sole **radiologist** on the Rockefeller Commission's Panel, views the materials. He notes that, although a bullet entrance is not *"readily detected,"* many *"linear fracture lines converge"* on the site of the *"small round hole...described in the autopsy report in the right occipital bone."* He notes further that *"one large metallic fragment is flattened against the outer table of the occiput."* He concludes that *"The x-rays and photographs are diagnostic of a gunshot wound in which the bullet struck the right occiput leaving a portion of itself flattened against the outer table before penetrating the bone, producing a small hole of entry largely obscured on the x-ray by the more extensive havoc caused in the brain and anterior skull represented by extensive fractures, missing bone, disrupted soft tissues and gas within the cranial cavity."* By concluding there was a bullet entrance in the location described in the autopsy report, Hodges rejects the conclusions of Dr. Morgan and the Clark Panel.

April, 1975. Dr. Robert McMeekin, a forensic pathologist on the Rockefeller Commission's Panel, views the autopsy materials. He is quite vague about what he observes, however. He reports simply that *"The evidence presented is consistent"* with the fatal bullet's being fired from the sniper's nest. He then notes that from studying the Zapruder film, he concludes that *"The motion of the President's head is inconsistent with the shot striking him from any direction other than the rear."* Note that he fails to say

the medical evidence says as much. Note that he fails to support the wound location and fragment location offered by the Clark Panel. From this it seems reasonable to assume McMeekin believed the Clark Panel and/or the original autopsists had made some mistakes, but didn't want to get in the middle of it. Intriguingly, the man running the Rockefeller Commission's investigation, former Warren Commission counsel David Belin, had presented the members of its medical panel with fourteen points that should be addressed in their reports. Not among them was the actual location of the entrance on Kennedy's skull. Not among them was the actual location of the large fragment on the A-P x-ray. Apparently, Belin had no interest in solving these mysteries.

April, 1975. Dr. Alfred Olivier, a veterinarian, and both a Warren Commission and Rockefeller Commission consultant on wound ballistics, is shown the autopsy materials. His report on his examination is also vague, and notes merely that *"It appears that the President was struck by two separate bullets that came from behind, somewhat to the right and above."* He offers no support for the entrance wound location offered by the original autopsists, nor the one offered by the Clark Panel. He never mentions the mysterious fragment readily identifiable on the A-P x-ray.

October, 1977. Dr. Lawrence Angel, a forensic anthropology consultant to the HSCA Forensic Pathology Panel, views the autopsy materials. In his report on his examination he notes that the fatal bullet's entrance *"appears to have been just below obelion and 18 mm to the right of midline."* Obelion is a point on the posterior parietal bone along the sagittal suture for which Angel gives no measurements. Angel also notes a *"radiopaque lump behind obelion with which cracks appears to mark entry."* In other words, he, like Hodges, does not see an entrance on the back of the head, but assumes the presence of one due to the fragment and fractures on the back of the skull. By claiming the entrance was below obelion and that the fragment was behind obelion, moreover, Angel also suggests that the fragment was above the bullet entrance, the opposite of what was suggested by Morgan and the Clark Panel.

February, 1978. Dr. Norman Chase, a **radiology consultant** to the HSCA Forensic Pathology Panel, is interviewed by an HSCA investigator. The memo on this interview asserts that while viewing the x-rays, Chase notes an *"entry point"* on *"upper rear head."* He reportedly claims further that a *"large metal fragment"* is *"prominent"* on the A-P x-ray, and that he *"believes it corresponds to the metal fragment in the rear of the head as evidence on the lateral view."* This suggests that he does not see an actual hole on the back of the head, and is even unsure if the the large metal fragment is on the back of the head.

February, 1978. Dr. William Seaman, a **radiology consultant** to the HSCA Forensic Pathology Panel, is interviewed by an HSCA investigator. The memo on this interview asserts that while viewing the x-rays, Seaman notes a *"possible defect"* in the *"upper rear skull,"* and that it *"could be an entrance wound and could not be a missile exit wound,"* but can not detect *"beveling of the skull at that point."* This beveling was not only supposedly detected by Morgan and the Clark Panel, it was measured down to the millimeter, and cited as proof the wound was an entrance wound. And that's not all... Seaman was a colleague of Dr. Lattimer's at Columbia University, and had assisted Lattimer in some of his experiments regarding the Kennedy assassination. (This was acknowledged in the May 1972 issue of Resident and Staff Physician, in an article on Lattimer accompanying Lattimer's article on the Kennedy medical evidence.) It seems quite likely, then, that Seaman was not an entirely unbiased party, as one should expect, but one who knew full well he was supposed to find an entrance at the *"upper rear skull."* And yet he only found a *"possible defect."* In the short report on the investigator's discussion with Seaman, for that matter, the large fragment is never mentioned.

March, 1978. Dr. John Ebersole, the **radiologist** at Kennedy's autopsy, is finally released from a military order of silence handed down within days of the autopsy. A March 9, 1978 AP article (found in the Reading Eagle) on an interview with Ebersole reports that he now admits *"I would say unequivocally the bullet came from the side or back...There is no way that I can see on the basis of the x-rays that the bullet came from anywhere in the 180-degree angle to the front, assuming Kennedy was facing forward. It looked to me like an almost right to left shot from the rear."* When, during his March 11, 1978 testimony before the HSCA Forensic Pathology Panel, Ebersole is shown Kennedy's x-rays and asked if he can identify an entrance location for a bullet, moreover, Ebersole responds *"In my opinion it would have come from the side on the basis of the films. I guess that is all that can be said about the films at this time... I would say on the basis of those x rays and x rays only one might say one would have to estimate there that the wound of entrance was somewhere to the side or to the posterior quadrant."* By saying that the x-rays only showed that the bullet came from the side or behind, Ebersole was acknowledging that he was unable to note a bullet entrance on the back of the head in the x-rays.

August, 1978. Dr. G.M. McDonnel, a **radiology consultant** to the HSCA Forensic Pathology Panel, views the enhanced images of the x-rays. He had previously viewed the originals. In his report on these examinations, he fails to note a bullet hole on the back of Kennedy's head. Instead, he notes a depressed fracture with radiating fractures 10.6 cm above the EOP. He also notes a metallic fragment 1 cm below this fracture, on the outer table of the skull, above the mid-portion of the EOP, that is *"nearly spherical"* on the enhanced A-P image. As he proceeds to describe this fragment as a *"spherical shaped contoured metallic fragment"* it seems clear he either had trouble finding it on the lateral view, and just named it in accordance with its appearance on the A-P view, or that he thought he saw a corresponding *"spherical shaped"* fragment on the back of the head in the lateral view. No one else, of course, has claimed to see such a thing.

August, 1978. Dr. David O. Davis, a **radiology consultant** to the HSCA Forensic Pathology Panel, views the enhanced images of the x-rays. In his report on his examination, he fails to note a bullet hole on the back of the skull, but says radiating fractures *"seem to more or less emanate from"* an *"imbedded metallic fragment"* 9-10 cm above the EOP on the outer table of the skull. He then notes that *"On the frontal view, this metallic fragment is located 2.5 cm to the right of midline, and on the lateral view, it is approximately 3-4 cm above the lambda."* As he later says the central point of the skull fractures is 3 cm from midline, this means that, in Davis' analysis, the large bullet fragment ended up to the left of the entrance.

1979. The Report of the HSCA Forensic Pathology Panel does not note an entrance hole apparent on the x-rays, but notes a depressed fracture as a *"sharp disruption of the normal smooth contour of the skull 10 cm above the EOP"* (which places it higher than in the Clark Panel Report, whose measurement of 10 cm was the distance to the 8 mm hole above the depressed fracture). The report also mentions *"suggested beveling"* of the inner table and radiating fracture lines. In its section on the course of the bullet through the head, moreover, it notes that *"embedded within the lower margin of this defect is a radiopaque shadow which, in the opinion of the panel, is a fragment of the missile. This shadow is 10 cm above the external occipital protuberance and 2.5 cm to the right of the midline"* in the A-P x-ray. (If one is to assume they shared the trajectory panel's belief the entrance was 1.8 cm from mid-line, this means the Pathology Panel felt the bullet fragment ended up to the right and below the bullet's entrance.) The report then notes that *"one surface of this fragment...is round. The maximum diameter of the fragment measures .65 centimeter."* This last measurement was not provided by any of the panel's radiology consultants, nor was it mentioned in the testimony of the panel's spokesman, Dr. Michael Baden, before the committee. As a result, one can only assume it was added into the report at

the last second, and was taken from the findings of Dr. Morgan and the Clark Panel.

1979. The Report of the HSCA Trajectory Panel claims the entrance high on the back of Kennedy's head was 1.8 cm to the right of midline and 9 cm above the EOP. This places the entrance 1 cm below the depressed fracture observed by the HSCA Forensic Pathology Panel, and on intact bone. This also contradicts the conclusions of the Clark Panel.

January, 1996. Dr. Douglas Ubelaker, a forensic anthropologist, is shown the autopsy materials and interviewed by the AARB. The report on this interview claims that *"No entry wound could be located anywhere on the A-P x-ray"* by Ubelaker. It notes further that he *"could not locate any entry wound to the head on the lateral x-rays,"* and that he noted a large fragment visible on the A-P x-ray, but *"could not find this object anywhere on the lateral x-rays of the head."*

February, 1996. Dr. John J. Fitzpatrick, a forensic radiologist, is shown the autopsy materials and interviewed by the ARRB. The report on this interview claims that *"No entry wound was seen on the A-P x-ray"* by Fitzpatrick. It notes further that he also claims *"No entry wound can be found on the lateral head x-rays."* It also reports that Fitzpatrick admits he's *"puzzled by the fact that the large radio-opaque object in the A-P skull x-ray could not be located on the lateral skull x-rays."*

April, 1996. Dr. Robert Kirschner, a forensic pathologist, is shown the autopsy materials and interviewed by the ARRB. The report on this interview notes that *"No entrance wound could be located on either the two lateral x-rays, or the single-A-P x-rays..."* by Kirschner. It then claims that he wonders if the supposed large fragment embedded on the back of the head was instead *"a plug of bone forced forward into the skull by an entering bullet."* This confirms that Kirschner saw no sign of this fragment or plug on the back of the head in the lateral x-rays.

The conclusions just discussed raise lots of questions.

First of all, how could the Clark Panel, using un-enhanced x-rays, "see" so much more than everybody else? Particularly when the panel's radiologist, Dr. Morgan, later complained that these x-rays were of "poor quality" and "severely over-exposed"?

The likely answer, of course, is that they didn't actually see these things, and only said they did because it helped them shut down the "junk" in Josiah Thompson's book, and build support for their argument that the actual entrance on the back of the skull was four inches higher than determined at autopsy.

But what about the other radiologists? Shouldn't an oval-shaped bullet entrance high on the back of someone's head be readily identifiable to experienced radiologists and doctors using computer-enhanced x-rays?

Why is there no consensus on what is shown in the x-rays?

It should be noted that the lack of a clearly identifiable hole on the back of Kennedy's head in the x-rays has led to some mighty strange speculation. While it was not my intent when writing these pages to go through every wrong or misguided statement made by a conspiracy theorist, Doug Horne's status within the so-called research community is of such a magnitude that I find it necessary to note some of his mistakes. Here is one such mistake...

On page 554 of his monster work, Inside the ARRB, Horne writes:

"Dr. Mantik believes that the apparent fragment trail seen in both lateral skull x-rays, high in the skull near the vertex, that appears to connect a point high in the forehead with the large displaced skull fragments high in the back of the head is real, and is evidence of a bullet's passage through the skull, as it disintegrated. If his definitive finding that there is no entry wound 1 centimeter above the so-called 6.5 mm object on the A-P x-ray is correct, and if the 3 pathologists are correct that the entry wound in the skull was really 4 inches lower than where the Clark Panel and HSCA tried to place it, then, as Mantik points out, the fragment trail near the vertex of the skull constitutes evidence of a second shot to the head, almost certainly entering high in the right front and exiting rather high in the rear of the skull, where the large displaced bone fragments are located on the right lateral x-ray. There is much evidence to support this placement of the entry for the missile which caused this fragment trail in the right front, and its exit in the rear..."

I'll give you a second to digest that. Yep, you got it... Horne is asserting that since Dr. Mantik believes there is no entrance high on the back of the head where the HSCA claimed it to be, that this then is evidence there was an entrance high in the right front and an exit high on the back of the head... Uhhh, silly question...But IF there is a hole on the back of the head--which Mantik doesn't even claim to see--who's to say that it's not the entrance described by the HSCA, only not where they said it was?

Baden's Bluff

While HSCA Exhibit F-53, Kennedy's lateral x-ray, at left, shows the fractured crown of Kennedy's skull to be contained within the scalp, the official depiction of Kennedy's wounds, Exhibit F-66, at right, depicts the crown as having been blasted from the skull. (The red star at left has been added to reveal the entrance location at right.)

Dr. Baden was so convinced the crown was missing, in fact, that he actually testified that the dark area on the A-P x-ray, Exhibit F-55, to which he is points at left, "shows the extensive loss of bone" near the "point of entrance beneath the cowlick area." This testimony was not supported by the subsequent report of his panel.

Baden's Bluff

Still, to be fair, Horne wasn't the first to speculate on large holes in the head unseen by others. I mean, at least he didn't claim to see such a hole on the x-rays. Not so, Dr. Michael Baden.

In his 1978 HSCA testimony, Dr. Baden pulled one of the all-time boners. (Excuse the pun).

If you look at the slide above, you'll see that the bone above the supposed cowlick entrance, at the crown of Kennedy's skull, is visible on the lateral x-ray. No one honestly disputes this. And yet, after entering this x-ray, Exhibit F-53, into evidence, Dr. Baden, the spokesman for the HSCA Forensic Pathology Panel, entered Exhibit F-66 into evidence. Exhibit F-66, a drawing which depicted both the location of the large defect and the skull fragments recovered from outside the skull, showed the crown to be missing.

While one might assume the artist creating this drawing had made a simple mistake, and had inaccurately placed the location of the large defect too far back on the skull, the testimony of the illustrator, Ida Dox, indicates she made these drawings under the close scrutiny of Dr. Baden. So was Baden the one at fault?

Undeniably, yes. During his testimony, when pointing to Exhibit F-55 and the bullet fragment supposedly on the back of Kennedy's head, Baden testified *"there are fracture lines radiating from the*

point of entrance marked by the relatively large fragment and the x-ray lines extending from it." He then used his pointer to encircle the large dark area on the right side of the skull in the x-ray, and continued *"This corresponds precisely to the point of entrance beneath the cowlick area and shows the extensive loss of bone in that area."* Baden had thereby supported the wound location in Exhibit F-66 and, in the process, revealed his inability to properly interpret x-rays. Although he spoke as a representative of a panel, furthermore, there is nothing to indicate his baffling conclusions were shared by anyone else. There is nothing in the Panel's report, nor in the report of any of the Panel's consulting radiologists, to indicate the dark area of the x-ray represents a loss of bone *"beneath the cowlick area"* on the back of Kennedy's skull. The autopsy photos, moreover, show that the head *"beneath the cowlick area"* remained intact. Conspiracy or no conspiracy, Baden was clearly pushing nonsense in this part of his testimony.

But it was intriguing nonsense, nonetheless. Since the lateral x-ray was darkest towards the front of the skull, and reveals a large defect in that area, it would only have made sense, should someone believe the dark area of the A-P x-ray represented an "extensive loss of bone", that the missing bone be on the forehead. Although refuted by the radiology literature, which asserts that a large dark area on a skull x-ray may only signify that there's air in the underlying tissues, this has indeed been the conclusion of many conspiracy theorists. So why did Baden take the opposite route, and testify that the dark area on the A-P x-ray was evidence of missing bone on the back of the skull by the entrance? Was he trying to refute the report of HSCA forensic anthropology consultant Lawrence Angel, and Angel's conclusion frontal bone was missing? Was he trying to cut-off speculation about a frontal entrance? Or was he just confused?

Baden's bluff, or blunder, along with his previously-discussed inability to properly orient the "mystery photo," demonstrates beyond any doubt that his credibility is questionable, and not just questionable by conspiracy theorists scratching for something, anything, to question.

The Distortion Problem

The Distortion Problem

The erratic interpretations of Kennedy's x-rays can be partially explained by the fact that Kennedy's A-P x-ray was unusually distorted. While many think of x-rays as see-through pictures, they are actually quite different. While in a photograph one is aware of perspective, that things in the background appear smaller than they really are, in a well done x-ray there is a fairly straight shot of the x-rays through the body, and each side of the body is accurately represented in proportion to the other.

This is not always true for x-rays created on portable x-ray machines, however. Researcher Joe Durnavich discovered that The General Electric machine used to make Kennedy's x-rays needed to be at least 72 inches away from the film to minimize magnification. In Kennedy's case it was only 44. This meant that the x-rays hitting the film were not heading straight through Kennedy, but were spreading outwards. This meant that the x-rays hitting Kennedy's face, by spreading outwards before they hit the film, magnified his face in comparison to the back of his head. Durnavich estimates that Kennedy's forehead was magnified 22% when compared to the back of his head. I've seen similar calculations in radiology textbooks and Durnavich's calculations appear to be accurate.

Adding to the confusion over Kennedy's x-rays, however, is that the x-ray techs couldn't figure out how best to prop up Kennedy's badly damaged skull. So they just sat it on the film cassette. As a result, his skull is tilted back approximately 14 degrees in the x-ray. While Jerrol Custer has said it was

tilted back as much as 30 degrees, this seems much too much. Joe Durnavich's slightly smaller estimate of 23 degrees fails to take into account that the x-rays were not framed with the skull in the anatomically upright position (The skull was tilted 10 degrees forward.) Larry Sturdivan, using measurements of Kennedy's teeth taken from the original x-rays, concluded the "net upward tilt of the head in the A-P view would be 11.5 degrees." When one lays flat on the floor, moreover, one's head tilts back 20 degrees or so even under normal conditions. Since this 20 degree backwards tilt comes with the occipital bone as the pivot, and Kennedy had a depressed fracture on the back of his head, it only makes sense his head would tilt back *less* than normal when laying flat on the table. (Dr. Joseph Riley is another who disputes that Kennedy's head was tilted back 30 degrees in this x-ray.)

On this slide, I have attempted to match up the relative positions of Kennedy's face and back of his head in order to figure out the exact locations of the skull fragments in the x-rays. On one side, I aligned the temporal region of his skull, once adjusted for magnification, with the A-P x-ray. This confirmed that the "trail of fragments" on the x-ray matched up perfectly with the large defect of the skull, and is apparently on the scalp. On the other side, I placed an adjusted-for-magnification photo of Kennedy's face (an inverted image of the left lateral photo), and placed it directly behind an adjusted-for-magnification back of his head. As I'd previously determined that the head in this photo was tilted back approximately 5 degrees, I tilted it back an addition 9, to reproduce the 14 degree backward tilt of Kennedy's skull in the x-ray, and then matched up the top of the A-P x-ray against this larger face. It seems to be fairly accurate. The forehead fragment projects right onto the forehead. The large fragment or slice projects right up near the crown of the head by the mysterious red spot...

Believing is Seeing

Satisfied with the results of my distortion analysis, I decided to try to do a comparison between the A-P x-ray and the lateral x-ray. While I had initially planned on copying the proportions and angles used by Joe Durnavich in his article, I quickly realized that you could not accurately project the distorted image of the A-P x-ray onto the lateral x-ray. I thought about cutting up the lateral x-ray into 10 slices, and then make each one progressively shorter than the first one, and then try to line them up to get a concept of how they would appear in the A-P x-ray. I started with the forehead. I decided to line up the exact heights of the forehead fragment. And then I had another breakthrough...

For when I lined up the forehead fragment in the A-P x-ray with the identical-sized forehead fragment on the lateral x-ray, I found the location of the "slice" on the back of the head. And it wasn't on the back of the head. And it wasn't even a "slice."

I noticed that just above the right eye socket there were a number of fragments, and that the largest of these fragments had the identical height of the supposed slice. I noticed also that it was at a slight angle, whereby it would appear to be thicker in the A-P and more radio-opaque than when viewed upright. I then spotted a small fragment just below it. And found that just below the "slice" supposedly on the back of the head in the A-P view there was a similar fragment. In short, I realized that the Clark Panel's statement that "there is, embedded in the outer table of the skull close to the lower edge of the hole, a large metallic fragment... Immediately adjacent to the hole on the internal surface of the skull, there is localized elevation of the soft tissues. Small fragments of bone lie within portions of these tissues," was, in fact a description of an area just above Kennedy's right eye socket, the very area from which Dr. Humes had testified to removing two fragments, one measuring 7 by 2 mm, and one measuring 3 by 1 mm.

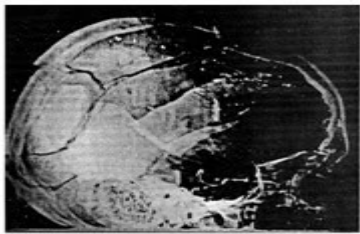

I then looked back at the un-enhanced x-rays used by the Clark Panel, and realized that the fragment I'd identified behind the eye was not visible on the lateral view, only on the A-P view, and that the small fragment in the forehead, believed by many to be the fragment recovered at the autopsy, was only barely visible on the lateral view, and completely invisible on the A-P. This led me to believe that Clark Panel radiologist Dr. Russell Morgan had made an honest mistake. He saw a fragment on the A-P view, couldn't find it on the lateral, convinced himself it was at the back of the head by the bullet hole "discovered" by Dr. Russell Fisher, and moved the fragment much as Fisher had moved the bullet entrance. The autopsy protocol used by The Clark Panel to help with their report, it should be noted, stated only that *"From the surface of the disrupted right cerebral cortex two small irregularly shaped fragments are recovered."* As a result, there is no evidence that Morgan or anyone else on the panel was aware that Humes had testified the largest fragment was behind the right eye. From this, then, it follows that the Clark Panel never even considered the possibility that the fragment on the x-rays was behind the right eye, and that the mistake of one expert--Morgan-- had become official government doctrine.

I was dazed by this revelation, and a bit saddened. I knew I would have an uphill battle trying to get people to believe a layman as myself could notice something overlooked by so many "experts". And so I decided to double-check Kennedy's post-mortem x-ray against his pre-mortem x-ray, to make sure what I presumed to be a bullet fragment did not pre-exist the assassination.

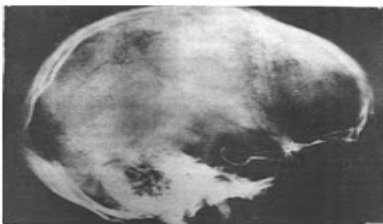

P.S. In his 2011 review of this website, published on the CTKA website, Dr. Mantik misled his readers by pointing out the small fragments below the large fragment on the A-P view, and claiming *"Metallic debris (claimed by Speer not to exist) just inferior to the 6.5 mm object, is identified by a horizontal lavender arrow. Some of these (lavender) fragments may have correlates on the lateral x-ray, which would then mark them as authentic metal debris."* When discussing the lateral x-ray, he then added *"Two tiny metallic-like fragments (invisible here--lavender arrow) can be seen on the x-rays at NARA."* The lavender arrow, no surprise, pointed to the back of the head. Well, this was yet another self-inflicted blow to Mantik's credibility. Mantik was purportedly reviewing this website. The above slide

has been a part of this website since it was created. I showed it at the COPA Conference in 2009, with Mantik in the audience. He mentions this slide in his review. Mantik is either lying or 100% in error to claim I said these fragments don't exist, when I have repeatedly and consistently shown where they are on the lateral view and have repeatedly and consistently presented them as compelling evidence the large fragment was behind the right eye. That he not only hides this from his readers but simultaneously claims the fragments are on the back of the head, where, by his own admission, no one else has seen them, smells to high heaven.

Seeing is Believing

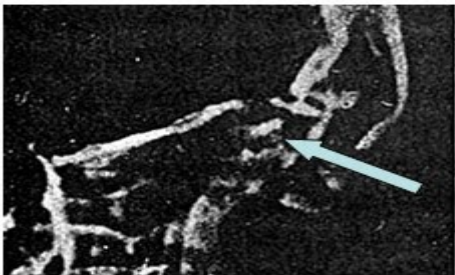

HSCA Exhibit F-53: Kennedy's right lateral x-ray

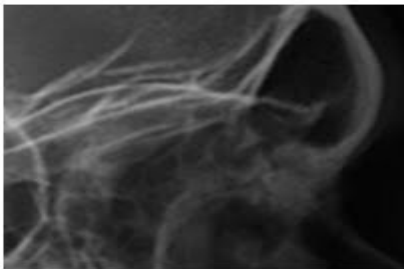

HSCA Exhibit F-297, Kennedy's pre-Mortem x-ray

Skull x-ray found online

Blow-up from Exhibit F-53 showing fragment location

Blow-up from skull x-ray showing normal eye socket

Although the fragment behind the eye apparent on HSCA Exhibit F-53 (at above left) seems obvious, the possibility exists that this opacity pre-existed the assassination. Unfortunately, the face was removed from HSCA Exhibit F-297, Kennedy's pre-mortem x-ray, (at above center), preventing a proper comparison. As x-rays found online, such as the one at above right, show nothing in the location of the presumed fragment, however, we can feel fairly certain that the white shape on the lateral x-ray is indeed a fragment. This is demonstrated at left.

Seeing is Believing

Although my alignment of Kennedy's A-P and lateral x-rays had led me to believe I'd found the location on the lateral x-ray of the supposedly 6.5 mm fragment easily observed on the A-P x-ray, I decided to study Kennedy's pre-mortem x-rays to confirm that what I saw was not a piece of bone. When I went to compare HSCA Exhibit F-297, the pre-mortem x-ray, against Exhibit F-53, the lateral x-ray, however, I was reminded that Kennedy's face had been cropped off the pre-mortem x-ray, and that a thorough comparison would therefore be impossible.

And so I did the next best thing. I studied dozens of skull x-rays online, to see if any of them had a white shape in the eye socket comparable to the one found in Kennedy's eye socket.

None of them did. Not even close. As a result, I came to feel quite sure that I had actually identified the true location of the supposedly 6.5 mm fragment on the lateral x-ray, and that it was in fact behind the eye.

This led me to reflect on everything I'd read about this fragment, how it was faked, how it was proof of forgery, how it was proof the head shot struck Kennedy in the cowlick. I thought of the HSCA's forensic pathology report and how it over-ruled the autopsy doctors on the head wounds. I thought

about some of the statements in the report, such as how when discussing the A-P x-ray they claimed the “missile fragment to be slightly to the right of the midline and in approximately the same vertical plane as in the above mentioned lateral view.” Approximately? They were given two years to solve the mysteries of Kennedy’s head wounds, and that’s the best they could do?”

I thought about this some more. And then I got mad.

The “Missing” Missile

I got mad on behalf of Dr. James J. Humes. Not only did he accurately depict the position of the large fragment in Warren Commission Exhibit CE 388, but he was right about its angle within the skull. And yet, even so, everyone believed the Clark Panel when they said the largest fragment on the x-rays was on the back of Kennedy’s skull. Why did they believe them? (Heck, for that matter, why did I for the longest time believe them?) Were we pre-disposed to disbelieve Humes because of his military background? Or was it his Warren Commission experience in particular that destroyed his credibility? Were the autopsy doctors the boy who cried wolf and the Clark Panel a wolf in sheep’s clothing?

I re-read every reference to the large fragment I could find. The autopsy report written by Dr. Humes states: *“There is edema and ecchymosis (bruising) diffusely over the right supra-orbital ridge (the eye socket) with abnormal mobility of the underlying bone”* and that *“roentgenograms (x-rays) of the skull reveal multiple minute fragments along a line corresponding with a line joining the above described small occipital wound and the right supra-orbital ridge... From the surface of the disrupted cerebral cortex two small irregularly shaped fragments of metal are recovered. These measure 7 x 2 mm and 3 x*

1 mm.” While these statements supported that the fragments were behind the eye, one might stretch them to support they were just behind the forehead as well. Perhaps then Humes' testimony was more specific.

Indeed, it was. Before the Warren Commission, Humes testified that while studying the x-rays taken at the beginning of the autopsy, he'd observed *"A rather sizable fragment visible by x-ray just above the right eye"* and that the majority of the fragments visible on the x-rays were *"dustlike...with the exception of this one I previously mentioned which was seen to be above and very slightly behind the right orbit."* After being shown Exhibit 388, on which this fragment was depicted behind the right eye, he then explained: *"We attempted to examine the brain, and seek specifically this fragment which was the one we felt to be of a size which would permit us to recover it."* Arlen Specter then asked: *"When you refer to this fragment, and you are pointing there, are you referring to the fragment depicted right above the President's eye?"* To which Humes replied: *"Yes, sir. Above and somewhat behind the President's eye."* He then continued: *"We directed carefully in this region and in fact located this small fragment, which was in a defect in the brain tissue in just precisely this location."*

Humes tried to get through to the HSCA as well. Dr Petty: *"the least distorted and least fuzzy portion of the radiopaque materials would be closest to the film, and we would assume then that this peculiar semilunar object with the sharp edges would be close to the film and therefore represent the piece that was seen in the lateral view"* Dr. Humes: *"Up by the eyebrow."* Dr. Petty: *"no up by the—in the back of the skull."* Petty returned to the topic later: *"we're trying to establish whether this particular sharp-edged radiopaque defect is close to the back of the skull or close to the front of the skull."* Dr. Humes: *"I can't be sure I see it in the lateral at all, do you? Do you see it?"* Dr. Petty evaded Humes' question and turned to Dr. Boswell: *"Were these fragments that were recovered at all?"* To which Boswell, obviously trusting Petty that the fragments were where he said they were, replied: *"No. They were not."*

When asked about the large fragment by the ARRB, Humes similarly relented: *"I don't remember retrieving anything of that size."* Later, however, when asked if he could spot any fragments on the lateral x-ray, he said: *"Well, you see, there's nothing in this projection that appears to be of the size of the one that appeared to be above and behind the right eye on the other one."* Wait. He claimed not to recognize the fragment, and yet he still knew exactly where it was—and it just so happened to be in the exact location where he'd found a fragment during the autopsy??? From this strange slip-up, one might assume Humes suspected all along that the Clark Panel's fragment on the back of the head was in reality the fragment he'd found near the forehead. By the end of his ARRB interview, in fact, he admitted as much, telling Jeremy Gunn that the large fragment *"that you saw in the first AP view of the skull could be the 7 by 2 millimeter one that we handed over to the FBI."*

Well, at least Humes tried to tell the truth. Unfortunately, no one believed him... that is, except Dr. Boswell, who shared his faith the fragment was the one removed at autopsy. In 1994, when asked about the largest fragment on the x-rays by Dr. Gary Aguilar, Dr. Boswell asserted *"The largest piece was up along the frontal sinus, right."* When shown the lateral x-ray by the ARRB, moreover, Dr. Boswell told Gunn *"I think we dug this piece out right here,"* and then explained *"right here"* as near the *"right eye...right supraorbital area."* He later told Gunn that the large semicircular fragment he'd initially had trouble identifying on the A-P x-ray might very well be *"the same as the one that appears to be in the frontal bone in the lateral."* Well, which part of the frontal bone? In any event, he was on the right track.

And he wasn't alone. While the radiologist at the autopsy, Dr. Ebersole, died years before he could be

called to testify before the ARRB, his two assistants at the autopsy, x-ray technicians Jerrol Custer and Edward Reed, who actually took the x-rays, were called to testify, and both confirmed that the large fragment on the x-rays was found behind the right eye. When asked in a series of questions if he could see the large fragment visible on the A-P x-ray on the lateral x-ray, Reed told Gunn, *"Yes, I can...In the frontal lobe...Right above the supraorbital ridge...Supraorbital rim. It is right impregnated in there."* Even more telling, when asked the same question a week later, Reed's boss on the night of the autopsy, Custer, testified that the large bullet fragment was located in the *"Right orbital ridge, superior."*

Their statements, moreover, echo what Secret Service Agent William Greer told the Warren Commission someone told him on the night of the autopsy. Greer testified: *"I looked at the X-rays when they were taken in the autopsy room, and the person who does that type work showed us the trace of it because there would be little specks of lead where the bullet had come from here and it came to the--they showed where it didn't come on through. It came to a sinus cavity or something they said, over the eye."* As Custer and Reed were but technicians, and not officially qualified to interpret the x-rays, we can only assume the "person" who claimed this was Ebersole.

So here we have the men most intimately involved with the skull x-rays ALL stating that the large fragment on the A-P x-ray was in the supraorbital ridge or that the trail of fragments came to an end behind the right eye. But can anyone else confirm this location? Perhaps someone who, unlike Custer and Reed, actually saw the large fragment removed?

Amazingly, yes. On the night of the autopsy, FBI agents James Sibert and Frank O'Neill took custody of this fragment. The receipt said: *"I hereby acknowledge receipt of a missile removed by Commander James J Humes."* These agents were therefore intimately involved in the recovery of this fragment. One might think then that they'd be sure to remember from where it had been recovered. While an 11-22-63 memo from their boss, Alan Belmont, written during the autopsy, claimed a bullet was *"lodged behind the president's ear,"* we can only assume this was a misunderstanding of what the agents had actually told their superiors over the phone. Sure enough, Sibert and O'Neill's 11-26 report on the autopsy asserts *"The largest section of this missile as portrayed by x-ray appeared to be behind the right frontal sinus."* As the right frontal sinus is just above the eyebrow and is an inch or so lower than the club-shaped fragment widely believed to have been the fragment recovered at the autopsy, this would put the bullet fragment, not an intact bullet as implied by Belmont's memo, behind the eye, and not the ear, as claimed in Belmont's memo. (The club-shaped fragment, it should be noted, was simply in the middle of the forehead, and not lodged behind anything, let alone another body part beginning with the letter "E".)

Lest that not be convincing, Sibert and O'Neill's subsequent statements further confirmed that the largest fragment recovered at autopsy was recovered from behind the eye, and not from the middle of the forehead. Although a 10-24-78 affidavit signed by Agent Sibert for the HSCA said merely that the fragments were recovered from the head, a report on an 8-25-77 interview with James Sibert notes *"Sibert believes that both fragments came from the head, probably from the frontal sinus region."* An HSCA Report on a 1-10-78 interview with his partner Frank O'Neill, moreover, confirmed that this fragment was recovered from just behind the eye. It states: *"O'Neill believes the doctors recovered a piece of the missile from just behind an eye and another one from further back."* On 11-8-78, O'Neill even put this in writing; his signed affidavit declares *"I saw the doctors remove a piece of the missile from just behind an eye and another one from further back in the head."* (P.S. It seems likely O'Neill thought the second fragment recovered was the second largest one noted on the x-rays. This is an understandable mistake. He noted two fragments in his report and the doctors recovered two fragments. Problem is they weren't the same two. The second fragment recovered by the doctors was found right

next to the frontal fragment while the second largest fragment observed on the x-rays was, according to O'Neill's own report on the autopsy, observed *"at the rear of the skull at the juncture of the skull bone."*)

And Sibert and O'Neil weren't the only autopsy attendees to recall the fragment's being removed from behind the eye. Roy Kellerman, the Secret Service agent in charge of Kennedy's detail in Dallas, also attended the autopsy, and was tasked with collecting the autopsy materials after its completion. In 1977, when discussing his role in the autopsy, he confirmed what Agent Greer had told the Warren Commission, and told the HSCA's investigators that the x-rays showed *"...a whole mass of stars, the only large piece being behind the eye, which was given to the FBI agents when it was removed."*

An Inconvenient Truth

So, why haven't researchers proposed that these men--the nine men most intimately involved with the taking of the skull x-rays and the collection of the bullet fragments--were correct, and that the largest bullet fragment was behind the right eye? Well, unfortunately it appears that in this instance we're at a rare cognitive confluence of single-assassin theorists and conspiracy theorists, where they both want the same thing, and claim the same thing is true, for entirely different reasons. Single-assassin theorists want to believe Dr. Morgan and the HSCA radiologists' claim the fragment was on the back of the head because it feeds their hope that the medical evidence is a closed book, with no more surprises. Conspiracy theorists, on the other hand, believe the claim because Dr. Mantik, among others, has long noted that the large fragment visible on the A-P x-ray is not visible on the back of the head in the lateral x-ray, and this suggests to them that the fragment was added later... which to them proves a conspiracy... (Ironically, this amounts to them wanting to believe it is there because they can then claim it's not there. Hmmm...)

Well, there are several problems with the thinking behind this "the fragment is fake so it's all a fraud" theory. One is that those adopting this position fail to adequately explore the possibility this fragment or white spot could have an innocent explanation. Limited Radiography (1999) provides a list of *"Common Problems"* in the *"Handling and Processing of X-Ray Film."* Among the common problems listed is the existence of *"white circular spots"* on the film. The cause of these spots? *"Fixer on film before development."* In all the discussion of the white spot on Kennedy's x-rays, I've yet to see anyone rule out that the spot could be a drop of fixer.

And two is that those pushing this position are overly in love with their theory, and prone to grossly exaggerating its merits...

By way of example, Doug Horne, in his 2009 opus Inside the Assassination Records Review Board, presents the ARRB testimony of Humes, Boswell, Reed, and Custer on this fragment, and interjects after each one that they were wrong about the location, without once noting that they were unanimous in their recollection. At one point, he explains: *"Everyone I know of who is qualified to interpret the A-P x-ray--the Clark Panel, the HSCA Forensic Pathology Panel, and Dr. David Mantik--agrees that the large, bright, 6.5 mm wide semi-circular fragment corresponds in location (if not in density and corresponding brightness) with a very small metallic fragment on the exterior surface of the rear of the skull about 100 mm above the external occipital protuberance."*

This is bizarre, to say the least. Horne can't claim Mantik, who insists the large fragment is not visible on the back of the head, as support for his supposition the Clark Panel and its colleagues on the HSCA

Panel, which both claimed it was visible on the back of the head, were indisputably correct in their conclusions, and that therefore Humes, Boswell, Reed, and Custer are wrong. Or, rather, he can, but not without coming across as someone with a blind spot as wide as Manhattan is tall.

This blind spot is brought further into focus by studying the appendices to Horne's book. Appendix 43, 44, and 45 are reports written by Horne on behalf of the ARRB, summarizing the findings of three outside consultants hired by the board to help them understand the medical evidence. Intriguingly, the substance of these reports was largely unknown to the public before Horne's book was published, some 13 years after the fact. While Forensic Anthropologist Douglas Ubelaker, after being shown the autopsy evidence, noted that the large fragment he saw in the *"vicinity of the orbit of the right eye"* on the A-P x-ray could not be located *"anywhere on the lateral x-rays of the head,"* and Forensic Pathologist Robert Kirschner speculated that the fragment *"near the right eye"* on the A-P x-ray *"might possibly be a plug of bone forced forward into the skull"*, thereby acknowledging that it could be somewhere other than on the back of the head in the x-ray, these men, in Horne's eyes, might not be qualified to interpret x-rays.

The third consultant, Dr. John J. Fitzpatrick, a Forensic Radiologist, however, most certainly was so qualified. According to Horne's own notes on his meeting with Fitzpatrick:

"No object directly or clearly corresponding to the bright 6.5 mm wide radio-opaque object in the A-P x-ray could be identified by the consultant on the lateral skull x-rays. Although there is a mere trace of some additional density near the fragment location at the vertex of the skull, the consultant did not feel this object was anywhere near the density/brightness required for it to correspond to the bright, radio-opaque density on the A-P x-ray. After briefly speculating that the small metallic density behind the right eye in the lateral x-rays might correspond to the bright radio-opaque density in the A-P x-ray, this idea was abandoned because neither the locations nor the density/brightness of the 2 objects are consistent."

Thus, contrary to Horne's assertion that *"Everyone I know of who is qualified to interpret the A-P x-ray...agrees that the large, bright, 6.5 mm wide semi-circular fragment corresponds in location (if not in density and corresponding brightness) with a very small metallic fragment on the exterior surface of the rear of the skull"*, the fact is that not one of the three consultants hired by the ARRB said as much, and that Dr. Fitzpatrick, a Forensic Radiologist, instead looked for this fragment behind the right eye--where he found a fragment previously not discussed in the medical literature--before deciding it didn't match up.

FWIW, I hope to contact Dr. Fitzpatrick in the future to see if the fragment he pointed out and rejected as the large fragment was the very fragment discussed on this slide. If it is, well, I suspect he is incorrect in his conclusion the location was incorrect. It bears repeating that I only came to notice this fragment after spending many hours time trying to match up the A-P and lateral x-rays. There is no evidence Fitzpatrick did this. It is incredibly ironic, moreover, that the fragment I'd observed is directly in line with the small fragment Mantik sees on the back of the head--suggesting the two overlap. Perhaps this overlap explains why the "density/brightness" of the fragment fails to match on the A-P and lateral x-rays.

On the other hand, there is no real reason to think the *"density/brightness"* of the fragment should match on the A-P and lateral x-rays. As pointed out by Jerrol Custer in his 1997 ARRB testimony, the lateral x-ray had *"much greater"* density than the A-P x-ray, and that, as a result, the fragment may have been *"burnt out"* of the x-ray by the increased exposure. Custer had, by 1997, been an x-ray tech for 28

years. He was, furthermore, well familiar with Dr. Mantik's theories. And yet, despite the fact he'd helped push conspiracy theories for years, and had obviously been unconcerned his testimony would be used against him, he firmly rejected Mantik's theories--all of 'em--in his ARRB testimony.

This hasn't gone unnoticed, by the way. In his epic Inside the ARRB, Doug Horne chooses to ignore the elements of Custer's testimony at odds with Mantik's theories. Horne claimed he did this, moreover, because Custer had been inconsistent, and that those trying to understand his inconsistent statements should go by his earliest statements. But this is ludicrous upon its face... I mean, think of it, in Horne's analysis, the initial opinions of someone shown published photos of cropped and computer-enhanced x-rays are more reliable than the opinions of this person after studying the un-cropped originals. This is the very definition of foggy thinking.

The 7 x 2 Confusion

At left: a blow-up from HSCA Exhibit F-56, showing the relative size of the supposedly 7 x 2 mm fragment in the forehead, at top, and the supposedly 6.5 mm fragment supposedly on the back of Kennedy's head, below. If the bottom fragment is really 6.5 mm wide, then the top fragment gives the appearance of a fragment 7.5 mm long. As the forehead on the x-ray was magnified 20% in comparison to the back of the head, however, we can assume the supposedly 7 x 2 forehead fragment was actually 6 mm long, not 7.

HSCA Exhibit
F-53, Lat. x-ray.

HSCA Exhibit
F-56, A-P x-ray.

HSCA Exhibit
F-56, A-P x-ray

HSCA Exhibit
F-53, Lat. x-ray

When one further compares the two fragments, one finds even better reasons to doubt the forehead fragment was the 7 x 2 fragment removed at autopsy. First of all, 7 x 2 is a two-dimensional measurement for what was undoubtedly a three dimensional object. This means one of the measurements is missing. When one looks at blow-ups of the forehead fragment on HSCA Exhibits F-53 and F-56, the second and third photos from left, it is obvious this fragment was of an unusual shape, more reminiscent of a piece of drift wood than something 7 x 2 (as depicted by the blue rectangles). When one looks at blow-ups of the supposedly 6.5 mm fragment, the 4th and 5th photos from left, moreover, one realizes that, while the fragment appeared crescent-shaped on the A-P view, it appeared roughly 7 x 2 on the lateral view. This suggests the possibility that the 7 x 2 measurement was meant to signify that the fragment was a crescent-shaped object roughly 7mm in diameter, and 2 mm thick. That this fragment can be seen behind the right eye—where the doctors claimed they'd retrieved the 7 x 2 mm fragment, moreover, seals the deal. The "6.5 mm" fragment is actually the "7 x 2" mm fragment!

The 7 x 2 Confusion

Horne's blindness when it comes to Mantik and the supposed fragment on the back of the head becomes even more clear when one realizes that, within Volume 2 of his book, he uses the consultants he ignores regarding the supposed fragment on the back of the head in the x-rays to help debunk that there was a bullet hole apparent on the back of the head in the x-rays. Well, one should ask, if these three consultants were "expert" enough for Horne to quote them regarding a lack of a bullet hole high on the back of the head in the x-rays (and thereby use them to contradict the conclusions of the Clark

Panel and HSCA Pathology Panel), why does he disregard their opinions when they fail to support that there is a fragment on the back of the head in this very same x-ray? I mean, how can he, after spending so much time discrediting the Clark Panel and HSCA Pathology Panel's conclusions, turn around and defer to their expertise regarding this fragment supposedly on the back of the head?

The answer, almost certainly, is that Horne couldn't care less what the Clark Panel and HSCA Pathology Panel had to say about anything, and was using their presumed expertise as a smokescreen to disguise that his belief there was a bullet fragment on the back of the head in the lateral x-ray stems solely from his trust in Dr. Mantik, and Mantik's near religious belief the fragment in the A-P x-ray has been added atop a much-smaller pre-existing fragment...

As stated, Horne needs it to be there, so he can say it isn't there...

As does the man he blindly trusts, Mantik... Despite Humes' repeatedly claiming that the bullet he removed was in the supra-orbital ridge behind the right eye, Mantik, in his articles discussing the fragment removed at autopsy, misrepresents the statements of those present at the autopsy, so that he can claim the fragment removed at autopsy was the fragment in the forehead. In *Assassination Science*, published 1998, he actually claims that the forehead fragment is seen on the A-P view above the 6.5 mm fragment and that *"The pathologists always refer to this one when asked about the largest fragment"* and that, furthermore, this fragment *"can also be seen on the lateral view where it does indeed lie just above the right frontal sinus--exactly where the pathologists described it."*

Well, this is quite a load. Having taken that route, however, Mantik follows it to the end. After misrepresenting what the doctors said, he correctly quotes the FBI report claiming the fragment was behind the right frontal sinus, but then interjects *"It should have said above."* He then uses his re-interpretation of the location of the fragment removed at autopsy as a broad description of this fragment, even reporting that when asked about the largest fragment recovered during the autopsy, Humes immediately *"referred to the fragment above the right frontal sinus."* This completely disguises that Humes' actual testimony was that it was *"up by the eyebrow."*

And this was no one-time thing, mind you. In his 2009 appearance at the JFK Lancer Conference in Dallas, Mantik presented a number of slides in which the forehead fragment was identified as the *"7 x 2 Fragment Removed by Humes,"* even though, as we've seen, 1) there was no mention of a forehead fragment in any of the reports on the autopsy, 2) Humes never claimed this was the fragment he'd recovered, and 3) Humes claimed instead that the fragment he'd recovered was found behind Kennedy's eye.

To be fair, it certainly seems possible Mantik's slipperiness on this issue is not a deliberate ploy to mislead his audience, but is instead a byproduct of his unwarranted acceptance that the 7 x 2 mm fragment removed at the autopsy is the 6 mm long club-shaped fragment visible on the forehead in the x-rays. Apparently, it never occurred to him that a three dimensional crescent-shaped object such as the purportedly 6.5 mm fragment might be described by the length across the crescent, approximately 7mm, by the thickness of the fragment, approximately 2mm, and that, accordingly, the 6.5 mm fragment "discovered" by the Clark Panel could be the 7 x 2 fragment removed at autopsy.

In this, he was far from alone. In fact, I may have been the first to make this observation...

But, apparently. it never occurred to him that the *"6.5 mm fragment"* could be elsewhere in the skull.

And...apparently, it also never occurred to him to look for this fragment where the autopsists actually said it was: behind Kennedy's right eye, where what Mantik now claims is *"probably a bone fragment"* is readily apparent...

This mistake is less understandable...particularly in that the autopsists had claimed to have recovered a 3 by 1 mm fragment from the same location as the 7 by 2 fragment recovered at autopsy, and there are no fragments anywhere near this size by the club-shaped forehead fragment Mantik claims was recovered at autopsy...

Yes. You got it. This inconvenient truth offers us a possible explanation for Mantik's utterly false claim I deny the existence of the small fragments beneath the large fragment on the A-P x-ray. As previously discussed, and demonstrated, these fragments are apparent on the lateral x-ray as well, right behind the eye. By claiming I deny their existence, and then claiming he (and he alone) has seen these fragments on the lateral x-ray, only by the back of the head, he hides from his readers that my location for the fragment recovered at autopsy--behind the right eye--is consistent with the autopsy report's description of a second fragment being found at this location, while his location (the middle of the forehead) is not.

And that's not all he seeks to hide. In his 2011 review of this website, Mantik not only refused to acknowledge his mistake regarding the location of the fragment recovered at the autopsy, (I mean, this was no surprise), he also failed to present the eyewitness support for my belief the fragment was really behind the eye. Instead, he insisted *"No expert has ever identified that site as a piece of metal...The discussion that follows from his misidentification should just be ignored--totally. The reader should simply ask himself a simple question: Who is likely to be correct--an amateur who has viewed only prints or zillions of experts, who have seen the x-rays? It is true that phrases (some by Humes, but others have contributed, too) have imprecisely located the 7 x 2 fragment...but the bottom line is simple: despite the semantic fog, there is really only one large metallic fragment under discussion--and it's not the 'slice' cited by Speer. His 'slice' is just a bone spicule, certainly not metal. It has nothing to do with the case, except that it might have resulted from trauma. The only authentic large fragment involved in the autopsy is the 7 x 2 mm one...which Humes removed."* (NOTE: whenever Mantik writes "7 x 2 fragment" he means the club-shaped fragment in the middle of the forehead.)

Well, this is horse droppings of the smelliest kind. By claiming that some *"phrases"* uttered by unnamed people have *"imprecisely located the 7 x 2 fragment"* Mantik hides from his readers that ALL the autopsy witnesses suggested that the large fragment was removed from where I claim it was and NONE of them suggested it was where he claims it was. This is particularly ironic in that Mantik has in both his study of the autopsy photos and Zapruder film upheld the recollections of the eyewitnesses over the filmed evidence. By pitting my observations against those of *"zillions of experts,"* moreover, he proves himself a total hypocrite, as these same "zillions" have failed to acknowledge the bulk of his own observations.

Oh, wait... What "zillions"? While one can not deny that some of those studying the x-rays have asserted the large bullet fragment I propose was behind the eye was really on the back of the head, the most recent experts to study the x-rays, including Mantik himself (if one wishes to consider him an expert), have not. This suggests that at least a few of these "experts" would be open-minded to my identification of the fragment, should they ever become aware of it. Even worse, and even more embarrassing to Mantik, none of the radiology experts noting the club-shaped fragment on the x-rays, beyond Mantik himself of course, have claimed it was the fragment recovered at autopsy.

Don't believe me? Well, then, let's go through them...

The Clark Panel, who "saw" much more than everyone else, made no mention of the forehead fragment. None of the Rockefeller Commission's experts mentioned it, either.

And the HSCA's consultants weren't much better. Dr. Angel mentioned a *"radiopaque mark"* near a bullet exit on the frontal bone--a bullet exit Mantik justifiably fails to acknowledge--but never claimed this "mark" represented the fragment recovered at autopsy. Dr. Chase mentioned a *"frontal fragment"* that was slightly higher than the largest fragment on the A-P view, and may have been discussing this in connection with its being recovered at autopsy, or not... Dr. William Seaman failed to note any bullet fragments. Dr. McDonnell noted a fragment above the sinus, but never claimed this was the fragment recovered at autopsy. Dr. David Davis never even once mentioned this fragment in his report. The report of the pathology panel, on the other hand, asserted that there were a number of missile fragments apparent on the x-rays, with a number of them between 2 and 6 mm, with the largest of these present *"beneath the skin in front."* That's right. They noted the fragment. But nevertheless failed to claim this was the fragment recovered at autopsy. As they claimed this fragment was but 6 mm, moreover, it seems possible that they'd doubted it was the 7 mm fragment recovered at autopsy. I mean, who knows? Certainly not Mantik.

The ARRB's three consultants, in closing, never mentioned this fragment.

So what was Mantik thinking about? While I at first was at a loss, I later realized that the first two independent examiners of the autopsy materials, Dr. John Lattimer and Dr. Cyril Wecht, discussed the forehead fragment in their articles on their examinations, and suggested this was the fragment recovered at autopsy.

Lattimer actually went further than that. In the May 1972 article on his examinations, he depicted a *"bullet fragment in front of brain"* and asserted *"The second largest fragment (7 mm x 3 mm, but crescentic) had come to rest in the front margin of the brain just above the top of the frontal sinus on the right."* As the largest fragment collected at autopsy was reportedly 7 x 2, and adjacent to the frontal sinus, this undoubtedly fed the suspicion that the largest fragment on the x-rays--the one Lattimer claimed was on the back of the head--was not the one collected at autopsy.

And Wecht built upon this suspicion. In the caption to Wecht's depiction of the lateral skull x-ray, published in the April 1974 issue of Forensic Science, he described a *"sizable fragment at the rear of the skull"* and then asserted *"Another sizable fragment is seen in the supraorbital region. A fragment from this location is reported to have been removed surgically and later subjected to spectrographic analysis."* As Wecht's report followed Lattimer's by almost two years, moreover, it seems reasonable to assume Wecht got this from Lattimer. Yep, irony of ironies, Dr. David Mantik has attacked me for not going along with what he claims to have been the conclusion of "zillions" of experts, when the actual provenance of this "conclusion" appears to have been the muddled mind of Dr. John Lattimer, not exactly a reliable "expert" on the Kennedy assassination medical evidence.

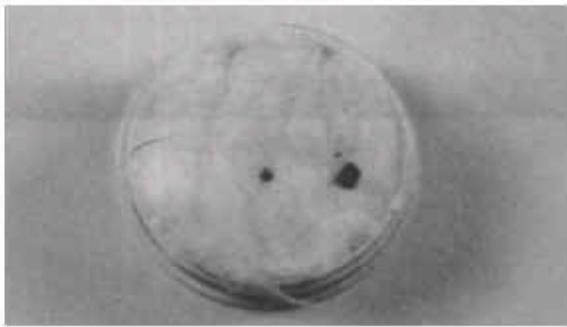

Well, what can I say? Although Mantik's writings on the x-rays undoubtedly provoked my interest in this aspect of the assassination, many of his claims have not stood the test of time, and I have found his attempts at sidestepping my conclusions pathetic and embarrassing. His assertion that Humes removed the club-shaped fragment, when Humes never said as much, and in fact suggested otherwise, is nonsense, pure and simple. And he should stop repeating this falsehood.

I mean, it's not as if I'm the first or only person to conclude the fragment placed in the archives--the one

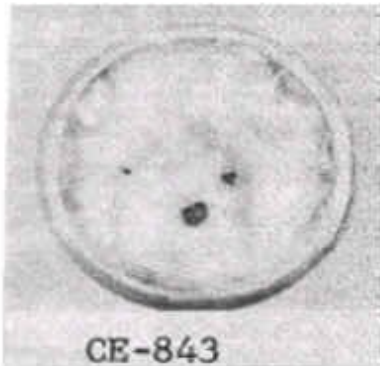

purportedly recovered at autopsy--is not the club-shaped fragment on the x-rays. The man who's visited the archives and viewed the x-rays more than any other has concluded that they, in fact, are not the same.

The name of this man? You guessed it. It's David Mantik...

The Fragment Fragment

Warren Commission Exhibit CE 843

CE-843

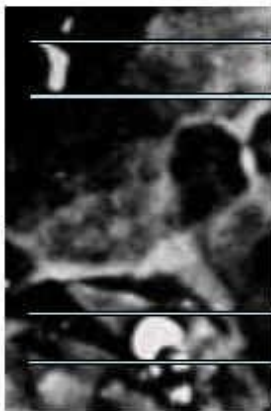

Across the top: three faces of CE-843.

Above: an FBI photo uncovered by John Hunt of the fragment that would eventually be designated CE-843. This is how it appeared before testing.

The Fragment Fragment

Now, to be clear, on this particular point I concur with Dr. Mantik. He was apparently the first to notice it, he deserves credit for it, and he is absolutely correct--CE 843, the fragment Humes claimed he'd removed from behind Kennedy's eye, bears no resemblance to the club-shaped fragment so many assume he'd recovered from the forehead.

In his essay *20 Conclusions After Nine Visits*, Mantik writes that this is “*One of the most shocking contradictions in the entire case. The shape of the larger piece of metal is nothing like the supposedly identical piece seen on the x-rays. No measurements taken on this piece can explain its bizarre transformation in shape. Most likely, it is not the piece taken from the skull...I saw only two, not three, at NARA. The largest, however, bears no resemblance to the corresponding image on the x-rays. The larger piece shown here is pancake shaped and was 107 mg. On the other hand the x-rays show a club shaped object—on both x-ray views. The studies done by the FBI on this object—spectrographic analysis and neutron activation analysis, required only a tiny amount at most, about 1 mg, according to*

one of the FBI experts...No one has offered an explanation for this flagrant discrepancy in shape of the largest piece. Sampling of the material is not an explanation. The possibility of substitution of fragments, an issue actually raised by the neutron activation expert (Dr. Vincent Guinn), remains wide open."

While it might seem strange my quoting Mantik on this issue, seeing as I've repeatedly demonstrated his lack of credibility, it's not half as strange as Mantik's insisting the 7 by 2 fragment removed at autopsy is the fragment on the forehead on the x-rays, and then turning around and admitting that the fragment in the archives is not the fragment one sees on the forehead. Hmmm... I mean, before insinuating some sort of switcheroo had been performed, shouldn't it have occurred to him that maybe, just maybe, the fragment removed at autopsy was not the fragment on the forehead, but was a fragment removed from somewhere else? Hmmm... Perhaps even from where the doctors claimed it had been removed, from behind the right eye? I don't know. Just a thought...

In any event, Mantik was correct to mention Guinn. Guinn testified before the HSCA that the fragment he tested, and the fragment subsequently seen by Mantik, was much smaller than the original fragment. While the fragment entered into evidence by the FBI was 107 mg, the one tested by Guinn 15 years later was only 41.9 mg. Robert Frazier, the FBI ballistics expert, described the fragments to the Warren Commission as follows: *"These fragments consisted of two pieces of lead, one weighed 1.65 grains. (107 mg) The other weighed .15 grains. They were examined spectrographically so their present weight would be somewhat less since a very small amount would be needed for spectrographic analysis."*

HSCA Chief Counsel Robert Blakey, however, followed up on Guinn's comments and was able to find out that the size of the fragment used in the spectrographic tests was 32.045 mg, not as large as the original fragment, and not as large as the remaining fragment. This means the FBI broke up the fragment and destroyed or lost more than 60% of its mass! The reasons for this are not clear. Since these spectrographic tests were done before Frazier's testimony, moreover, this means the photographs of CE 843 entered into evidence during his testimony showed only the remaining fragment. This, then, explains the discrepancy noted by Mantik.

But not really. When one reflects back on Mantik's description of the fragment as *"pancake-shaped,"* and considers the size and shape of the fragment apparent in the forehead, it seems likely that the original-full-sized CE 843 looked nothing like the fragment apparent in the forehead, and is, if only by default, most likely the fragment seen behind the eye on the x-rays.

This feeds back into the possibility that the 7 by 2 measurement given for this fragment represented an irregular 7 mm pancake that was 2mm thick, and not a thin pole 7 mm long by 2 mm in diameter, as so many assume. Perhaps the rounded edge of this fragment, then, represents the rounded edge of the lead missing from CE 569, the hollow base of a bullet found beside the front seat of the limousine.

One finds support for this possibility, in fact, in the most surprising of places. In Larry Sturdivan's 2005 book *The JFK Myths*, he recounts his 2004 visit to the Archives to view the Kennedy autopsy materials. When discussing the supposed 6.5 mm fragment on the x-rays, which Sturdivan believes is an artifact, he offers *"The disk was not as nearly circular as it appears on the view printed in the HSCA report. The edges are irregular, with the 'bite' being merely the largest indentation in the irregular, jagged margin."* This irregularity of the edges would appear to be more consistent with the edges being lead from the inside of the bullet, than of their being the outer margin of a smooth copper jacket.

And we can see this for ourselves. At the 2003 assassination conference put on by Dr. Cyril Wecht,

researcher John Hunt displayed photos he'd recently uncovered at the National Archives, including photos taken by the FBI of the bullet fragments prior to testing. These photos revealed a much larger fragment than the one entered into evidence by Frazier, with a rounded edge on the far side of the fragment, and a bite out of the near side. Intriguingly, the shadow of this bite approximates the shape of the bite visible on the x-ray fragment. Intriguingly, when one rotates the fragment in one's mind, so that the bite appears in the 5 o'clock position of the bite apparent on the x-ray, a small shelf of lead is lifted towards the top of the fragment when seen from the side, precisely where such a shelf is visible on the lateral x-ray. When one looks at the fragment in the photo, and compares it to the shape of the forehead fragment apparent on the A-P x-ray, moreover, it's clear that the fragment in the photo is too thick to be the club-shaped fragment on the x-ray. As a result it seems almost certain that this fragment is the large fragment seen on the x-ray, and that it was found behind the right eye, exactly as claimed by Humes.

Not that Mantik will acknowledge this, of course. In his 2011 review of this website, Mantik asked himself *"Has Speer explained the discrepancy between the 7 x 2 mm fragment (seen on the x-rays) and the quite different fragment in evidence at NARA?"* He then responded by claiming that John Hunt has *"discovered that only 2 mg was actually taken for spectroscopy. This is only a tiny fraction of the original mass (106.92 mg) of the larger fragment."* Well, beyond his continuing to call the club-shaped fragment the 7 x 2 fragment, when this fragment was not in the location of the 7 x 2 fragment recovered at the autopsy, Mantik misled his readers on a crucial point. The fragment at NARA is not 104.92 mg, as suggested by Mantik, but 41.9 mg. The fragment used in the spectrographic tests was 32.05 mg. This suggests that the 106.92 mg fragment was broken into pieces. The break-up of this fragment, irregardless of the reason, offers us a reasonable explanation for why the bullet fragment in the archives photos fails to match its appearance on the x-rays.

It's Only Make Believe

LOCATION OF HEAD WOUNDS IN PRESIDENT KENNEDY

Below: a blow-up from Exhibit F-56, with red and blue lines added to demonstrate the relative widths of the bullet fragment and skull.

At left, HSCA Exhibit F-147, presenting the conclusion that Kennedy's skull was 17.5 cm wide. At right: HSCA Exhibit F-56, Kennedy's A-P x-ray, featuring a bullet fragment purported to be 6.5 mm in diameter.

When one measures the diameter of the fragment on the x-ray, and divides it by the apparent width of the skull on the x-ray, one receives a numerical expression of the size of the fragment in relation to the widest part of the skull. When one multiplies this number by 17.5, one finds this to be about 7.4 mm. If one accepts that this 17.5 measurement was the actual width of the skull, prior to the magnification of the x-ray, moreover, one finds that the fragment, should it actually have been on the back of Kennedy's head, would have to have been about 8.9 mm in diameter. In short, the 6.5 mm measurement was only make believe, no matter how you slice it.

It's Only Make Believe

It was not until 2010--years after I'd first concluded the supposedly 6.5 mm fragment on the back of the head was really the 7 by 2 fragment removed from behind the eye, that I finally realized the obviousness of it all. It was while looking through a presentation by, no surprise, Dr. David Mantik. In this presentation-- while arguing that the fragment had been added to the x-rays, Dr. Mantik had repeatedly argued that the supposedly 6.5 mm fragment must have been added on, as it made no sense for an actual fragment 6.5 mm in diameter to end up on the back of the head, and it made no sense for an accidental artifact to be precisely 6.5 mm, the width of the bullets fired in the rifle found in the book depository.

Well, I thought, how do we know it was precisely 6.5 mm? Ding. Ding. Ding. Alarm bells sound. Hmmm...

We don't! The Clark Panel, the same experts who incorrectly re-located the entrance on the back of Kennedy's head...and the same experts who misrepresented the level of Kennedy's back wound in comparison to his throat wound...and the same experts who claimed there were two left lateral x-rays in the archives, but no right lateral x-ray, said so. That is all.

While the report of the HSCA's forensic pathology panel also noted that the "*maximum diameter*" of the "*radiopaque shadow*" on the back of the head "*measures 0.65 centimeter*," it made no mention of where they got this measurement, and it seems clear they simply pulled this from the report of the Clark Panel.

To refresh, that report claimed: "*On one of the lateral films of the skull (#2), a hole measuring approximately 8 mm. in diameter on the outer surface of the skull and as much as 20 mm. on the internal surface can be seen in profile approximately 100 mm. above the external occipital protuberance. The bone of the lower edge of the hole is depressed. Also there is, embedded in the outer table of the skull close to the lower edge of the hole, a large metallic fragment which on the anteroposterior film (#1) lies 25 mm. to the right of the midline. This fragment as seen in the latter film is round and measures 6.5 mm in diameter immediately adjacent to the hole on the internal surface of the skull, there is localized elevation of the soft tissues. Small fragments of bone lie within portions of these tissues and within the hole itself. These changes are consistent with an entrance wound of the skull produced by a bullet similar to that of exhibit CE 399.*"

Well, as we've seen, these conclusions are far more precise and far more detailed than the conclusions of ANY expert or panel of experts to look at the x-rays, before or since...even AFTER the x-rays had been enhanced by a computer. NO other expert to study the x-rays, beyond those on the Clark Panel, ever gave an exact measurement for the large fragment, let alone claimed it was 6.5 mm in diameter, the exact diameter of a cross-section of the ammunition purportedly used in the shooting. It follows then, that, sure as snow in Minneapolis in January, the Clark Panel were blowing smoke. I mean, let's get real, they found a fragment on an x-ray and claimed the size of this fragment suggested the use of the presumed assassination weapon. The books on radiology I've studied have virtually all warned against this, and have claimed instead that you can not determine with precision the bullet caliber of a bullet on an x-ray...and are better off not even trying.

Should one doubt me on this, well, here's another passage by Dr.s James Messmer and B.G. Brogdon from chapter 18 of A Radiologic Atlas of Abuse, Torture, Terrorism, and Inflicted Trauma (2003):

"There is a great temptation, always to be resisted, to estimate the caliber of a bullet or size of a shot by eyeballing the projectile on a radiograph. Any missile contained within the body will be magnified to some degree upon radiography, and only a small degree of magnification destroys any hope of accuracy. The actual difference in dimension between the caliber of weapons commonly used in both military and nonmilitary weapons is really quite close together in size. Moreover, the common designations of caliber are not really precisely accurate."

Let's recall here that the Clark Panel studied the photos and x-rays over the course of two days... in secret. They did not talk to the x-ray techs who created the x-rays, nor to the radiologist and autopsy doctors who'd studied them. As a result, there's no reason to believe they'd acquired the information necessary to even approximate the actual size of the bullet fragment.

But we can give it a shot, if only just to see if they were even in the ballpark. In 1978, during the testimony of trajectory expert Thomas Canning, drawings of Kennedy were entered into evidence that included the claim Kennedy's head measured 17.5 cm at its widest point. When one measures the supposed 6.5 mm fragment, and divides it by the measurement of the widest point of the skull on the x-rays, however, and then multiplies this by 17.5, one discovers that the fragment would be about 7.4 cm wide...

Or so it would seem... Let's see if we can get to the bottom of this...

According to Joe Durnavich's article on the x-rays, published on the website of John McAdams, the face on Kennedy's A-P x-ray was magnified by 22% in comparison to the back of the head. This means that the widest point on the skull would not be above the ear, as one would normally expect, but at the side of the forehead. It follows then that, if the large fragment on the x-rays was behind the eye, as I propose, it was about 7.4 mm in its longest dimension.

If this fragment was on the back of the head, as purported by the Clark Panel, however, the fit is not so nice. You see, the fragment gives the appearance of being 7.4 mm wide when one assumes the fragment is at the widest part of the skull. For this fragment to appear so wide, when it is actually on the back of the head, then, it would have to be wider than 7.4 mm. By a rough guesstimate (feel free to conduct your own tests on this matter) what appeared to be the widest part of the skull was magnified around 20% over the back of Kennedy's head. If so, this means that the supposed 6.5 mm fragment, if it was on the back of the head as purported, was actually about 8.9 mm in diameter, and not precisely 6.5 mm, as so widely believed.

That's right. If the 17.5 cm measurement for Kennedy's skull provided by the HSCA is correct, the supposedly 6.5 mm fragment supposedly on the back of the head was not 6.5 mm wide.

So where did this measurement come from? Did the Clark Panel just make it up?

Maybe. On the other hand, as the 17.5 measurement provided by the HSCA is far larger than what one would expect for a human skull, and would seem to be the measurement of the skull on the x-ray, on which magnification is apparent, the Clark Panel may have simply thought that "Heck, the skull on the x-ray has been magnified about 20% over its actual size" and then adjusted their measurement of the fragment to account for this magnification. This would reduce the size of the fragment down to about 6.2 mm wide, which they may have considered close enough to 6.5 mm wide.

If they did this, of course, they were incorrect. There was no magnification at the back of the head, and

no adjustment was necessary.

Mantik Rides Again

On October 12, 2010, Dr. David Mantik, responding to my writings on this subject through Dr. James Fetzer, replied: *"The 6.5 mm object lay at the very rear of the skull, so it should have been very close to the film. That means magnification was minimal. For the actual size of the 6.5 mm object on the film, my OD graphs are best: measurements were to within 0.1 mm. Is that precise enough?"*

Now, at first I took this as a claim that Dr. Mantik's measurements showed the fragment to be within 1 mm of 6.5 mm wide, and that the fragment therefore was most logically 6.5 mm in diameter.

This led me to claim that, if this was true, then the skull on the x-ray was not 17.5 cm, as claimed by the HSCA. Because the proportions just aren't right. $6.5\text{mm} / 17.5\text{ cm} = .0371$, while the skull fragment on the x-ray represents .0422 the apparent width of the skull. For the fragment to be 6.5 mm on the x-ray, moreover, the skull would have to be 15.4 cm wide on the x-ray. Since the skull was magnified on this x-ray, by about 20%, this would mean the skull was about 12.8 cm in width before magnification--too small. Still, perhaps the magnification was not as great as I've been led to believe. But if the skull was actually 14-15 cm wide, and appeared to be 15.4 cm wide on the x-ray, then from where did the trajectory panel pull this 17.5 cm measurement? Hmmm... Either Mantik is incorrect or the HSCA trajectory panel pulled this measurement from its collective rump.

But then I re-read Mantik's words. He is clearly deferring to his OD graphs. These graphs were published in Assassination Science.

Here is his OD Graph for the A-P x-ray.

Figure 5. JFK AP skull X-ray: 6.5 mm object.
Horizontal scan: right to left.

Now, even by a conservative interpretation of the data, whereby the fragment starts around the 2 mm position and ends around the 9.5 mm position, the fragment is larger than 6.5 mm, and is about 7.5 mm. As Mantik believes the magnification of this fragment was minimal, moreover, it certainly appears that he is acknowledging that the supposedly 6.5 mm fragment was really not 6.5 mm, and is more in line with the 7.4 mm fragment I'd proposed.

Thank you, Dr. Mantik.

Or not. In June 2011, in the by-now much-mentioned article published on the CTKA website, Dr. Mantik responded to my many criticisms of his research and analysis. This article, sadly, was filled with a multitude of dubious boasts and claims, some of which we've already discussed. Among these claims was Mantik's strange assertion the fragment on the x-ray was really 6.5 mm even though his measurements showed it to be 7.4 or so. When asking himself if the 6.5 mm object was actually that size on the A-P x-ray, Dr. Mantik actually claimed *"of course it was. This size was cited by both the HSCA and the Clark Panel."* Well, I could stop right there. For Mantik to claim these panels as unimpeachable sources on anything was strange enough. But from there things only got stranger.

Yes, welcome to Strangeland. Although Mantik failed to dispute my 7.4 mm measurement for the shape on the OD graph above, he nevertheless insisted that my *"measurement technique"* was *"highly unorthodox"* and that *"Most scientists would measure from the halfway point (between minimum and maximum ODs) at either end of the curve."*

What silliness! If, for some reason, it was known that the object on the x-rays was flat and directly facing the x-ray, this might make sense. But since the object was believed to be a 3D fragment, whereby its edges would most likely be less thick than its center, and where its center would therefore have the greatest OD, measuring from the halfway point between minimum and maximum ODs would

only serve to under-report the true size of the fragment.

P.S. Since Dr. Mantik's measurements suggest that the fragment was roughly 7.4 mm wide on the x-ray, we can go ahead and assume the HSCA's 17.5 measurement was taken from the A-P x-ray, with its magnified skull. This means then, that, should the fragment be behind the right eye, as I presume, then the fragment would not be its apparent size of 7.4 mm, but be about 6.2 mm. Since the fragment behind the eye would, in my correlation, be angled away from the film, moreover, it follows that its actual size would be a bit more than 6.2 mm, and approximately that of the 7 mm fragment removed at autopsy.

Chapter 18b: More Fun with X-rays

In Search of the Great Red Spot

For the longest time, I suspected that the “slice” on the x-ray was embedded at the back of Kennedy’s head in the location of the red spot. With my discovery of the “slice” on the lateral x-ray, however, I avoided making such a sorry claim on this website presentation. (Only time will tell how many other sorry claims remain.) Anyhow, when you align the A-P x-ray with the back of the head and mystery photos, it becomes clear that the bullet “slice” was in fact, considerably to the right of the red spot. This is in keeping with the HSCA radiologists who said the fragment was to the right of the purported cowlick entrance.

So what was the red spot? For a brief period, I was tempted to conclude the red spot was merely the dried blood Dr. Humes suggested it was. But then I remembered that, when I matched up the neck lines in the back of the head photo with those in the mystery photo, the hairline wounds were suddenly

in the same position as the one measured at the autopsy, and the red spot suddenly aligned with the beveled exit on the mystery photo. This seemed way too much a coincidence. This led me to conclude the red spot represented an impact location on the inside of Kennedy's skull created by an exploding bullet fragment. Close-ups of the scalp reflected from the beveled bone in the mystery photo reveal a small dimple on the underside of the scalp, far too small to represent the exit of a full-sized bullet.

Ironically, the possibility exists that the fragment causing all this damage was the one found by Humes in Kennedy's frontal lobe. Perhaps it landed in the lobe only after ricocheting off the inside of the back of Kennedy's skull, leaving a line of macerated brain stretching from the far back of Kennedy's head to his eyebrow, perhaps shedding small fragments along its way. This would certainly help explain the purported "channel" of brain damage observed on the brain photos.

Should one think that this fragment would have been likely to break through the skin at the point of the red oval, one should be reminded that books on the human skull acknowledge that it takes 30% more energy to pierce a skull when it's covered with skin, and that skin is therefore much stronger than most believe. The bullet that killed Oswald, by curious example, cut through his entire body, including a number of organs, only to come to a sudden stop beneath the skin of his back.

Still, if the red spot overlay a hole in the skull caused by the large fragment removed at autopsy, it might appear that Humes lied to the HSCA. After all, when asked about the red spot in the cowlick, he answered: "I don't know what that is. Number one, I can assure you that as we reflected the scalp to get to this point, there was no defect corresponding to this in the skull..." It remains possible, though, that he wasn't lying. When he said "there was no defect corresponding" he may have been thinking in terms of the entrance he described to the Warren Commission, that is, a round hole completely surrounded by bone. Since so much of the skull collapsed as he reflected the scalp, and since he had such limited experience with gunshot wounds, it seems entirely reasonable that Humes would overlook what we now interpret as beveling, especially as it was some distance from what he'd determined to be the entrance and exit on the scalp.

X-ray/Ida Dox Drawing Comparison

X-ray/Ida Dox Drawing Comparison

When testifying before the HSCA, medical illustrator Ida Dox declared that the depiction of the skull fractures in the HSCA's medical exhibits was determined after "studying very carefully the x-rays...in close consultation with the medical panel, particularly Michael Baden." As noted elsewhere, Baden had pressured her to change her drawing of the back of the head to make the red smudge in the cowlick look more like a bullet entrance, and thus sell that the bullet entered near the top of Kennedy's head, at not near the bottom, as noted at autopsy. This alone should give us pause and make us double-check the accuracy of the fractures in these drawings.

Sure enough, when one compares the Dox illustration that details the skull fractures on Kennedy's head, Exhibit F-66, to Kennedy's x-rays, one can't help but notice another one of Baden's "improvements." While there is a diagonal fracture heading towards the right at the back of the head on the Dox drawing, this fracture doesn't appear on the x-ray. Although lateral x-rays are not expected to give clear images of fractures along the very back of the head, due to the density of the skull when looked at on edge, this fracture winds its way far enough to the side where it should be visible. So where is it? And, just as importantly, if it's not on the x-ray, why is it on the drawing?

And why are there fractures on the x-rays not depicted on the drawing? The large fractures originating near the President's temple and running towards the back of his head were apparently overlooked by

Dox and Baden. The intersection between the fracture originating near the purported in-shoot in the cowlick and the fracture coming from the wound near the temple, where it is made obvious that the temple wound pre-dates the cowlick wound, was also overlooked, apparently. But isn't it a bit ridiculous to think that they also overlooked the two fractures running horizontally across the lower back portion of the skull? (The occipital region).

That these last fractures are troublesome is made clear when one reads the Clark Panel and HSCA reports and realizes that these fractures are never explained and are barely even acknowledged. While the Clark Panel, for instance, made the dubious claim that there was a hole 100 mm above the EOP and that "Immediately adjacent to the hole on the internal surface of the skull, there is localized elevation of the soft tissues", they didn't once mention the obvious and easy-to-distinguish fractures running horizontally across the back of the skull.

These fractures were ignored by most everyone, in fact, until radiologist Randy Robertson attempted to write about them in Radiology Magazine. Editor Stanley Siegelman submitted Robertson's article for peer review to at least two doctors who'd staked their reputation on their belief that there was only one headshot. He then violated standard protocol and publicly rejected Robertsons's submission, stating that these fractures were concentric fractures from the in-shoot in the cowlick, as per an article by Smith et al in the September, 1987 Journal of Forensic Sciences. When one reads the referenced article, however, one finds that concentric fractures are created slightly after a bullet's impact as a result of increased intracranial pressure in the skull. This couldn't have happened in Kennedy's skull, however, because there were purportedly multiple exits created by its fragmenting bullet, which would immediately release the pressure. Similarly, the article demonstrates that concentric fractures have long spokes which are linked together by smaller fractures, as internal pressure builds and radiates outwards from the in-shoot. Accordingly, the smaller fractures connecting the spokes are not found at the end of the spokes, like a bicycle tire, but are lower in the spokes like a spider web. This is simply not the case with Kennedy's fractures, where the spokes coming from the bullet fragment appear to end at the transverse fracture in the occipital region. This indicates that the occipital fractures pre-date the fractures purportedly coming from the bullet slice.

Adding to the likelihood that the troublesome features on the x-rays were deliberately excluded from the Dox drawing is the fact that, on exhibit F-66, the bullet is depicted traveling straight through Kennedy's head, down towards the seat in front of him. This would be Connally's seat, where NO bullet fragments were found. This drawing also fails to depict how the nose of this bullet raced across the car at the level of Kennedy's head and struck the windshield, and how the tail of this bullet struck the windshield frame nearby. That this last deception was deliberate is borne out by the pathology panel's report, which states "in the experience of the members, the estimated size of the principal exit defect is consistent with the size of *a single exiting missile representing the mass of the two major fragments recovered outside the body*". Since the "two major fragments" were the nose and the tail of the bullet, and were missing large sections of the middle and were thus not able to comprise a "single exiting missile," the HSCA medical panel was as much as admitting that the large skull fractures by the supposed exit made no sense! Not surprisingly, F-66, created under Dr. Baden's supervision, fails to depict these fractures.

That the panel tried to hide the lack of logical support for their conclusions is further evidenced by their description of the bullet's path through the head. The report notes "The x-ray evidence indicates that the missile fragmented on impact, produced a number of outwardly radiating fractures, and proceeded in an essentially straight and forward path and to the right, paralleling the upper surface of the head. This type of missile fragmentation is consistent with a jacketed missile. *The main core mass probably existed in a single fragment that remained intact until striking the automobile, causing it to fragment into several pieces.*" This is one of the most preposterous passages in the whole report. First, how does

a bullet fragmenting upon impact with a skull remain intact until after exiting the skull, and then break up on a windshield or metal strut? It doesn't. Second, how does a "main core mass" entailing the nose and base of a bullet leave the contents of its middle in a skull, but exit intact? It doesn't. And third, since the largest recovered fragment was deformed and folded over on itself to a greater degree than one would expect from its merely striking a windshield, how does one conclude that this fragment "probably" exited the skull as part of a much larger fragment? One doesn't. Thus, the panel's conclusion regarding the fragments is absolute garbage, indicative of either the panel's own confusion, or its desire to confuse or mislead others.

As Dr. Baden himself, in his book *Unnatural Death*, repeats this nonsense about the bullet exiting intact and breaking up on the windshield frame, it seems likely he either actually believed or actively pushed this silliness. It seems mighty convenient for Dr. Baden and his contention of a cowlick entry that the exhibits created under his supervision not only failed to depict the occipital fractures on Kennedy's skull and the large fractures by the supposed exit, but the bullet's presumed exit trajectory to the windshield, which made little sense for the supposedly intact bullet needed to create the large exit fractures. It kinda makes one wonder whether Dr. Baden is a scientist or a salesman.

On the other hand, the errors and omissions might just be an honest mistake. For the life of me I can't figure out any reason the Dox drawing would show the bullet descending at 20 degrees when the reported degree of declination from the sniper's nest is 16 degrees. Maybe Baden and Dox were in way over their heads.

“Wing” Analysis

Above: crop of Z-323, displaying the shadow of the bony “wing”

At right, above and below: Groden autopsy photos.

Bone

Scalp

“Wing” Analysis

Another aspect of the medical evidence which has convinced many of fakery or deception is the “wing” of bone visible in the autopsy photos. It seemed to move from photo to photo and change shape. After much thought, however, I believe I have an explanation for these changes.

When one looks at the Zapruder film, one can't help but notice the large opening on Kennedy's skull apparent in the frames after 313. This opening appears to begin just in front of his ear. When one looks at the right lateral autopsy photo one sees exposed bone behind his ear, however, and in a location where there was reportedly no missing bone or scalp. This is a clear indication that this bone was dislodged from someplace else. And yet it's still attached to scalp... Hmm...

After some consideration I realized that when the scalp exploded downwards, the skull bones that were attached to it began to peel away. One large fragment peeled all the way and crashed to the floor. (It can be seen flying down in the frames after 313.) A section of bone lower down on Kennedy's skull, however, possibly including his sphenoid bone, didn't finish peeling away from his scalp. It was, instead, left dangling by a thread of scalp by Kennedy's ear. (The shape of this bone can be seen in shadow in frame 323.) When Jackie Kennedy tried to close her husband's head wound, moreover, she failed to flip this “wing” of bone back around to match up with the scalp, and left this “wing” dangling inside out back behind Kennedy's ear. This is apparent in the right almost-lateral autopsy photo. Not

surprisingly, the shape of this wing matches the shape of the shadow in frame 323.

When one looks at the back of the head photo, obviously taken a few minutes later, as Kennedy is now lying on his side, however, one can see that the “wing” of bone has suddenly changed. It is now far forward of the ear and of different proportions. I believe this is because it’s no longer a “wing” of bone, but a “wing” of scalp, the stubborn scalp that held the wing in place for so long. The dimensions of this scalp flap can be seen in frame 337.

It seems likely, then, that the wing of bone had either fallen to the table or been removed when the scalp and skull were more closely examined. This is not pure speculation, for that matter, as Dr. Humes testified that, early in the autopsy, when he and Dr. Boswell "moved the scalp about" while looking for metal fragments within Kennedy's skull, bone "fragments of various sizes would fall to the table..."

This so-called "wing of bone" becomes important when interpreting the x-rays. If the x-rays are Kennedy's, and were taken before the photographs, as purported, then the wing should be readily visible.

So where is it?

Where is the “Wing”?

Does the location of the “wing” on the analysis below (between the red lines) match its location in the photo at right?

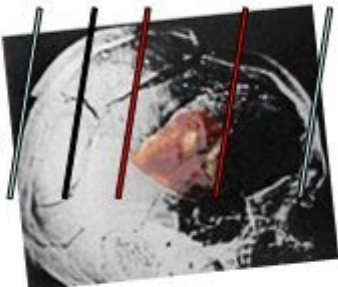

Groden Autopsy Photo

When one projects the location of the head rest in the autopsy photos (the black line) onto the x-rays, the answer is clearly a “NO.” The “wing” is much closer to the back of the head.

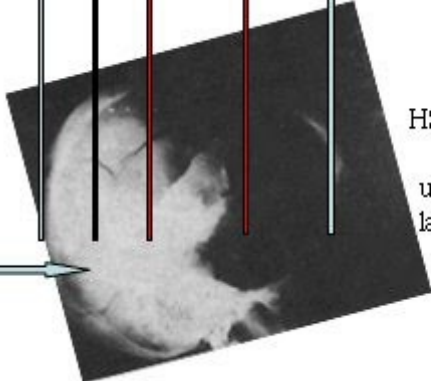

Fox autopsy photo: left profile, image inverted

The light blue lines represent the position of the back of the head and forehead on the x-rays.

At left: the “wing” analysis of Joe Durnavich, using the enhanced x-ray, with lines added.

Actual tip of “wing” →

HSCA Exhibit F-52, the un-enhanced lateral x-ray.

Top and bottom images matched by position of the ‘wing’.

Where is the "Wing"?

Before I began this project I knew virtually nothing about x-rays. After reading about some of the controversies involving the Kennedy assassination, I eventually decided it was time to get my feet wet and learn a thing or two. The first thing I read was an online article by Joe Durnavich entitled “Making Sense of the Head X-rays,” available on Professor John McAdams’ JFK site. I was extremely impressed with this article, particularly its identification of the “wing” of bone on the lateral x-ray. When I tried to use Durnavich’s location on a comparison between the x-ray and right lateral autopsy photo for this presentation, however, I learned something unexpected. Durnavich, and just about everybody else who’s written on the x-rays, was wrong.

When one matches the wing of bone in size and angle in Durnavich’s analysis with the wing of bone on the right lateral autopsy photo one is at first amazed. Holy smokes, that’s the bone alright. When one aligns the wings in the x-ray and photo vertically, however, it becomes apparent that the x-ray extends way behind the skull in the photo. Even though the photo is at a slight angle, when one turns the face in the photo to be in perfect profile in one’s mind one can see the back of the head does not align with the x-ray. A closer look and one realizes, moreover, that the wing on Durnavich’s analysis is in front and above the spongy-looking bone on the x-ray; this is the mastoid process and it signifies the location of the ear. The photo, on the other hand, demonstrates that the wing is above and *behind* the ear.

When one uses an inverted view of the left lateral photo and matches it with the un-enhanced x-ray this becomes even more apparent. When one finds the right tilt for the skull, and lines up the skull dimensions, and depicts the position of the wing on Durnavich’s analysis on Kennedy’s profile, one can see that Durnavich’s “wing” begins almost on Kennedy’s face, when the actual wing is at last an inch and a half back in his hair. When one looks at the un-enhanced x-ray, moreover, one finds that Durnavich’s wing is located over a considerable amount of black space. When one considers that the wing of bone overlay intact skull, and that this means the x-rays penetrating it would have to penetrate three skull walls instead of two, then it’s really hard to understand how the wing could show up as black.

When one looks on the x-ray where the wing is on the photo, however, it all becomes clear. For the location of the wing on the autopsy photo--draping down behind the ear almost to the table—is the very location of the mysterious white area we discussed on the optical density slide. The “wing” is the white area!! This makes perfect sense as it represents three walls as opposed to two. As Custer and Reed did not allow for this extra level of density in the skull—it’s doubtful they even discussed it since the doctors had not yet examined the body—they would have set the levels as if they were x-raying a skull with only two walls. The area with three walls would therefore go un-penetrated, and remain white. This unexpected overlay of bone, furthermore, distorted the relative density of the entire x-ray.

Ironically, Dr. David Mantik, who was to conclude that the white area “was almost certainly added in the dark room. Its purpose was to emphasize the resulting dark area in front, which suggested that a bullet had exited from the front,” was on the verge of figuring out this mystery before his suspicious nature got the best of him. In *Assassination Science*, he discussed the white area in less paranoid terms. He said: “On close inspection, this remarkable white area is distinctly wider on one lateral view than the other. *This implies that it was located closer to the right side of the skull.*” He was so close and yet so far. Apparently, he never realized that the range of optical density measurements he’d derived from normal skull x-rays bore little relation to the range one would expect on an x-ray of a badly damaged skull with over-lapping skull fragments.

Until it was too late, and he was wed to his mistake... On November 21, 2009, I saw the concluding question and answer session of Mantik’s presentation at the JFK Lancer conference in Dallas. As I struggled toward the back of the room, I was stunned to see half the audience turn to look at me. As I sat down and looked up, moreover, I saw that Mantik, too, was looking at me. As the questioner in the front row resumed his question, however, I realized why. Someone had asked Mantik if the overlapping

bone and missing bone on the x-ray could significantly alter the density range. He called it "Speer's theory." Mantik, however, refused to acknowledge that this would have much of an effect, and summarily dismissed "Speer's theory" with the claim I was a layman and didn't know what I was talking about, and that my theory was so unscientific that he felt testing the density range of a skull damaged as badly as Kennedy's to be a total waste of time.

But it wasn't the theory of a layman. Oh no, far from it. On 10-21-97, Edward Reed, one of the two x-ray techs to assist in the autopsy of President Kennedy, testified before the Assassination Records Review Board (ARRB). When examining the lateral x-rays, Reed noted *"The dark spot that I am pointing to right now is a less dense area. There's hardly any bone there. And there's only one side intact. Whereas here, posteriorly, where I'm pointing to now is--the white area--is where the bones overlap."*

Reed's words presented a serious challenge to Mantik's theory. Not only did they pre-date my development of "Speer's" theory by seven years or so, but they show that one of Mantik's biggest supporters, Doug Horne of the ARRB, knew of my argument against Mantik's theory before I'd even stumbled on it.

So how does Horne deal with this in his book? In Volume 2 of his five volume opus Inside the Assassination Records Review Board, Horne devotes 33 pages to a discussion of Reed's testimony. Curiously, however, while he skips right over Reed's common sense explanation for the "dark spot" and "white area" of the x-rays, he finds the space to point out repeatedly that Reed was just an x-ray tech, and not qualified to interpret any x-ray, let alone the x-ray of a gun shot victim. This overlooks that Mantik, to whom Horne frequently defers, is but a radiation oncologist, and has almost certainly never worked with x-rays like the ones made of Kennedy, let alone interpreted them.

It's actually worse than that. In September, 2010, I finally took a look at the Power Point presentation Mantik delivered in Dallas the year before. On one of his slides, The White Patch: Evidence of Its Absurdity, it is noted that "No such white patch was seen in 19 cases of death due to gunshot wounds to the head, in x-rays collected by Douglas DeSalles, MD from forensic files." If I'm reading this correctly, it means that the OD measurements Mantik boasts prove the lateral X-ray a forgery were established not through his own intensive study of hundreds of x-rays, as one might guess, but through the study of but 19 x-rays collected by Dr. Doug DeSalles, a fellow researcher. Well, were these x-rays taken with the same kind of portable x-ray machine used to make the x-rays of Kennedy? Did they depict high-velocity gunshot wounds to the head? Did they depict skulls with missing fragments, set side by side with overlapping skull? I'd bet the farm they did not.

And you should, too. On another one of his slides entitled The White Patch: Impossible to Explain via Overlapping Bone, Mantik further revealed his lack of credibility. He claimed "that the Dark Area contains two layers of skull bone, one from each side, yet this area is astonishingly dark. One more layer of bone will not turn the Dark Area into a white patch." Yikes. How could he have missed that Reed and myself had argued that the White Patch was three layers of bone, and that the Dark Area was one layer of bone, and that the White Patch had therefore represented 300% as much bone, and instead claim that we believe the White Patch was three layers, and the Dark Area two, and that the White Patch had therefore represented but 50% more bone?

While I'd prefer to believe Mantik was above blowing smoke, I must admit that if I'd discovered a single-assassin theorist misrepresenting my theory in such a manner I'd have stood up from the crowd and corrected him. Hmmm... Maybe this explains Mantik's nervousness when I approached him after his presentation. I don't know.

On October 12, 2010, however, Dr. Mantik responded to some of my claims, and gave me reason to believe that he just isn't in touch with the facts. In a post on the Education Forum, Dr. James Fetzer

related some comments from Mantik. One of these comments dealt with Mantik's "white patch," and my assertion it did not overlay the wound location proposed by most conspiracy theorists. To this, Dr. Mantik responded: *"The original lateral X-ray probably showed missing BRAIN in the current area of the WHITE PATCH. It was the missing brain, not missing skull, that likely led to the WHITE PATCH. This is one of my older points: on the lateral X-ray, it is missing brain that typically produces obvious dark areas, not missing bone!"*

Well, heck, there it is. Mantik thinks the dark areas on the x-ray reflect missing brain. He fails to appreciate the obvious--that the un-enhanced x-rays show skull fractures on the intact skull that have nothing to do with missing brain and everything to do with missing skull. He simply fails to understand that, should one of the skull fragments on the back of the head be absent, the dark lines designating the fractures on the skull would be expanded to fill the gap, and become a "dark area." I mean, this isn't exactly rocket science. If losing a layer of bone would not make the skull appear much darker on an x-ray, as Mantik claims, then the skull fractures we all see on the x-rays are some sort of illusion.

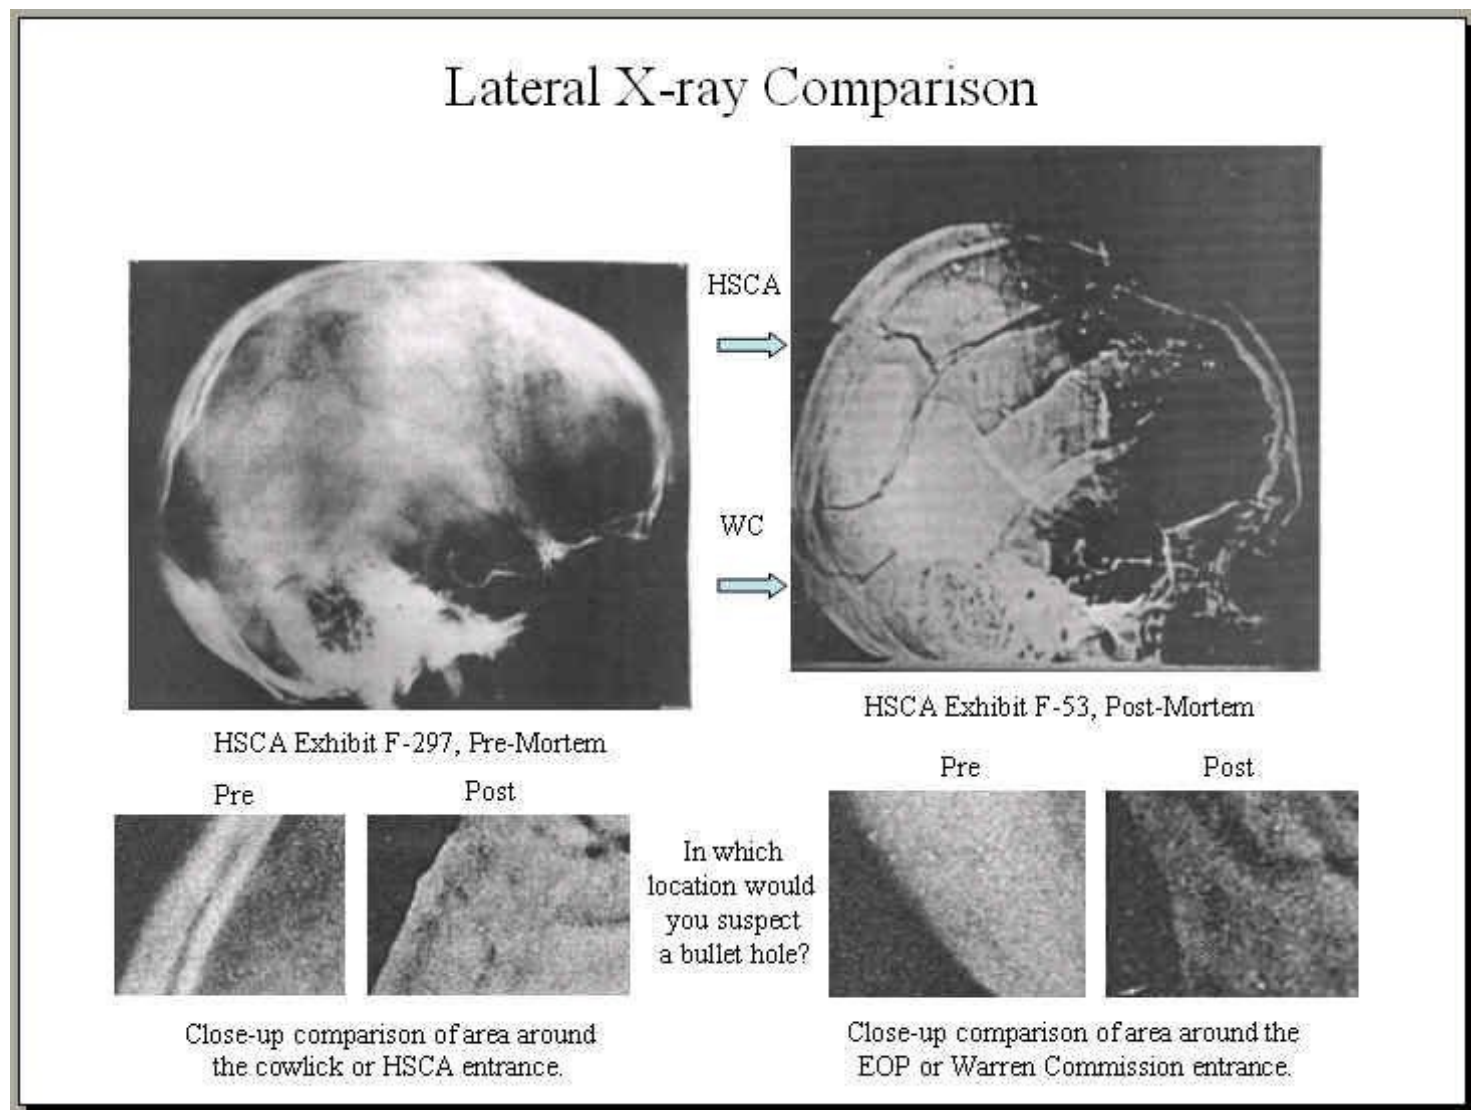

Manual of Roentgenological Technique (1947) obliterates Mantik's claim missing brain "typically produces dark areas" on x-rays, and "not missing bone!" On page 134, it informs: "The thickness of the skull varies in different localities and since the density of the bony structures is in large part the determining factor in the production of the roentgenogram, those variations in thickness cause a pronounced difference in the density of the shadow produced. Owing to this localized thinning of the bone, five normal dark areas are seen in the skull corresponding to the thinner parts." It then lists these five "normal dark areas": Number one on this list is the "frontal bone on its lateral aspect just anterior to the coronal suture." This is the location of the "dark area" on Kennedy's x-ray Mantik finds so puzzling.

But no matter. We'll discuss Mantik in more detail later. We were discussing the deleterious effect of Mantik's mistakes on Horne. Such an impact becomes clear when one reads Horne's book's appendices. Yep, once again, the reports Horne wrote on his 1996 meetings with the ARRB's three consultants on the medical evidence undermine his subsequent conclusions. Forensic Anthropologist Douglas Ubelaker, upon viewing the lateral x-rays, noted "overlapping bone fragments" in the "temporal-parietal region of the lateral x-rays." This is almost certainly a reference to the white area noted by Mantik. More specifically, however, Forensic Radiologist John J. Fitzpatrick, a man with far more expertise on these matters than Mantik, confirmed that "overlapping bone is clearly present in the lateral skull x-rays" and that "the red flap above the ear" in the autopsy photos "equates with the overlapping bone in the lateral skull x-rays." (Although Mantik summarized the findings of Ubelaker and Fitzpatrick in his presentation, he failed to report that they'd both foreshadowed and offered strong support for what he preferred to call "Speer's theory." It's hard to believe this was an oversight.)

And from there it only gets worse... Near its conclusion, Horne's report on Fitzpatrick admits: "after reviewing some brief summaries of the independent research efforts of...Dr. Mantik...He did not find the work...to be persuasive, and did not concur with (his) findings..." (While Mantik did report Fitzpatrick's lack of approval, he presented it to his audience as a mystery, and failed to discuss the reasonable probability that Fitzpatrick did not concur with his findings at least in part because he believes Mantik's White Patch to be overlapping bone... what Mantik prefers to call "Speer's theory.")

In any event, I'm not the first to make the observation that the wing of bone or red flap on the autopsy photos represents the white area on the x-rays. Fitzpatrick had done so in 1996 and Edward Reed had done so in 1997. When one goes back to 1978, in fact, one can see that HSCA radiology consultant William Seaman, working with the un-enhanced x-rays, had also noted "overlapping skull pieces," much as the ARRB's anthropology consultant Ubelaker. That only makes sense. But what does not make sense is Doug Horne's being told, as far back as 1996, of a common sense explanation for the white area on the lateral x-ray...and then failing to raise this issue with Mantik...

Oh, wait, it does make sense. Perfect sense. Sometimes even the best of us are so stuck on our theories -- or so enamored with our favorite expert or witness -- that we fail to look beyond them.

Lateral X-ray Comparison

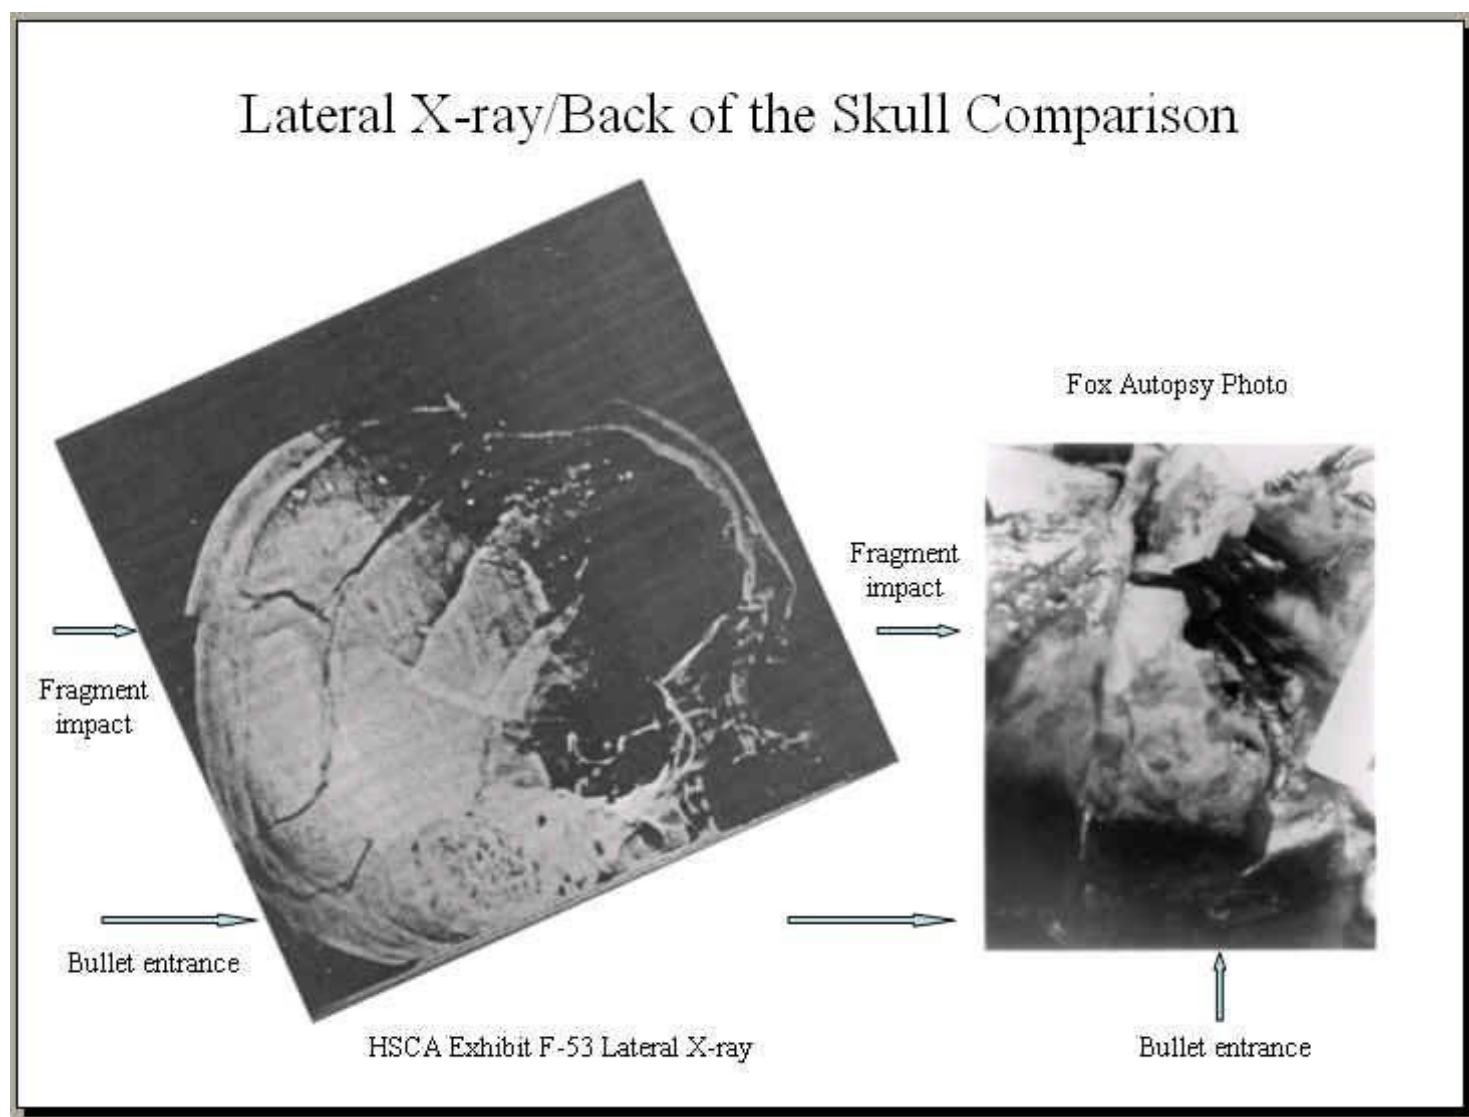

Newly armed with this information that the “white area” on the lateral x-ray was in fact the “wing” of bone, we can look at the lateral x-ray with a fresh perspective. One thing one notices immediately is that the lower occipital fracture leads directly into the white patch, and appears to re-emerge on the far side of the “wing.” This is a strong indication that these two fracture lines are really one, only with a short distance of its length blocked off by the “wing.” This, of course, means that Dr. Randy Robertson was wrong, and that the occipital fractures did not derive from an occipital entrance. Since much, much earlier we noticed that the lowest of these fractures seems to run right up to the entrance in the hairline, and then veer away, it seems clear that the EOP entrance pre-dated the huge fractures coming from the temple. This is in keeping with our analysis of the angle of entry.

When one compares the lateral x-ray to the pre-mortem x-ray of President Kennedy, moreover, one can find that some of the whiteness in the “white area” pre-dated the wing. In other words, the wing overlapped an area already demonstrating dense bone. This makes it difficult to isolate the exact shape of

the wing. One can also find through such a comparison the location of some of the sinuses—air pockets-- in the bones of Kennedy's skull. Since one of the pre-existing air pockets has a fracture running out of it on the autopsy x-ray, some might try to convince themselves this signifies the location of the EOP entrance. But they would be wrong, as this point is well above the EOP.

When one compares the location of the HSCA in-shoot to this same location on the pre-mortem x-ray, however, one can see a previously unseen dark shape on the bone, almost assuredly a result of a fragment's impact on the interior skull. This leads one to wonder what can be noticed at the EOP entrance location. Despite the HSCA's insistence that there were no signs of this entrance to be found, a dark shape almost certainly signifying this entrance, and one that is far more prominent than the shape in the cowlick, is precisely where Humes said it was! And no, it's not an artifact...

Should one be skeptical that an entrance wound in the occipital bone could create so few fractures, one should remember that the test skull submitted by Larry Sturdivan to the HSCA demonstrated just that.

Lateral X-ray/Back of the Skull Comparison

Since there are so many who believe the open-cranium photograph and the lateral x-ray are in complete disagreement, I decided to put them side by side and size them, to see if this was so. After careful study,

I have concluded they represent the same skull at different points of an autopsy. Apparently, the source of the confusion lies in Dr. Boswell's measurements of the head wound, which are quite large and stretch from the back of Kennedy's head to its front, and are in accordance with the photograph, but in disagreement with the x-ray and the other photographs with Kennedy's scalp intact. What people seem to miss is that Boswell's measurements were performed on the skull *after* the scalp was peeled back and the brain removed. This was some time after the lateral x-ray was taken, and before any incisions were performed on the body. That the wound changed shape when the scalp was peeled back is confirmed by Dr. Humes' testimony, both before the Warren Commission and afterwards, where he recounts how large chunks of skull fell to the table when he peeled back the scalp, and how he had to break off even more pieces of skull to remove the brain. When one compares the x-ray and photograph, one can even make out these large chunks of skull.

Should one believe that the measurements were taken before the scalp was peeled back, one should ask oneself how accurate measurements could have been taken with Kennedy's long blood and brain-matted hair in the way. That the hair was not shaved is confirmed by everyone present.

Especially remarkable when one makes this comparison is that the bullet hole visible on the autopsy photo appears to match up perfectly with the shadow apparent on the x-ray. This shadow almost certainly represents the small entrance in the occipital bone described by Humes. But is it apparent on the A-P?

A-P X-ray Comparison

Above: HSCA Exhibit F-55, before "enhancement"

Below: blow up of area "enhanced" into oblivion.

What did it show?

Above: HSCA Exhibit F-56, the "enhanced" x-ray, which is missing the bottom portion of F-55, the very area they were supposed to be inspecting.

A-P X-ray Comparison

According to the report of the HSCA radiology consultant Dr. G.M. McDonnell, he inspected the x-rays on March 7, 1978, and made suggestions to Aerospace Corporation, El Segundo, California, as to what portions should be digitized and enhanced for further analysis.

One of the reasons cited for this procedure was that "enhancement permitted analysis or elimination of artifacts on the images." (This makes me nervous already. Since so many of the mysteries of the x-rays have been interpreted as "artifacts", one can't help but wonder what "artifacts" were "eliminated" in this "enhancement," and whether any valuable information was lost in the process.)

His report goes on to say he re-examined and discussed the (now-enhanced) x-rays on April 6 and 7 with the photographic evidence panel and again on his own at the National Archives on June 2. What is suspicious about this whole sequence of events, however, is that when one compares the un-enhanced and enhanced x-rays it is startlingly obvious that the lower back of the head has disappeared from the enhanced x-ray! While one might say that McDonnell simply didn't find that area relevant, this would be akin to calling McDonnell a moron. The area in question is where the autopsy doctors said there was an entrance. The area in question was closely studied on the photographs. While the area on the x-rays may well have revealed nothing, the failure to enhance this area revealed all. To me it is a clear indication the HSCA's panelists and consultants had a pre-disposition to support the

conclusions of the Clark Panel and assert the president was killed by a shot entering near his cowlick. Even if this meant damaging the reputations of the autopsy doctors. Even if this meant ignoring the truth...

A-P/Lateral X-ray Comparison Comparison

HSCA Exhibit F-55, A-P x-ray

HSCA Exhibit F-52, right lateral x-ray

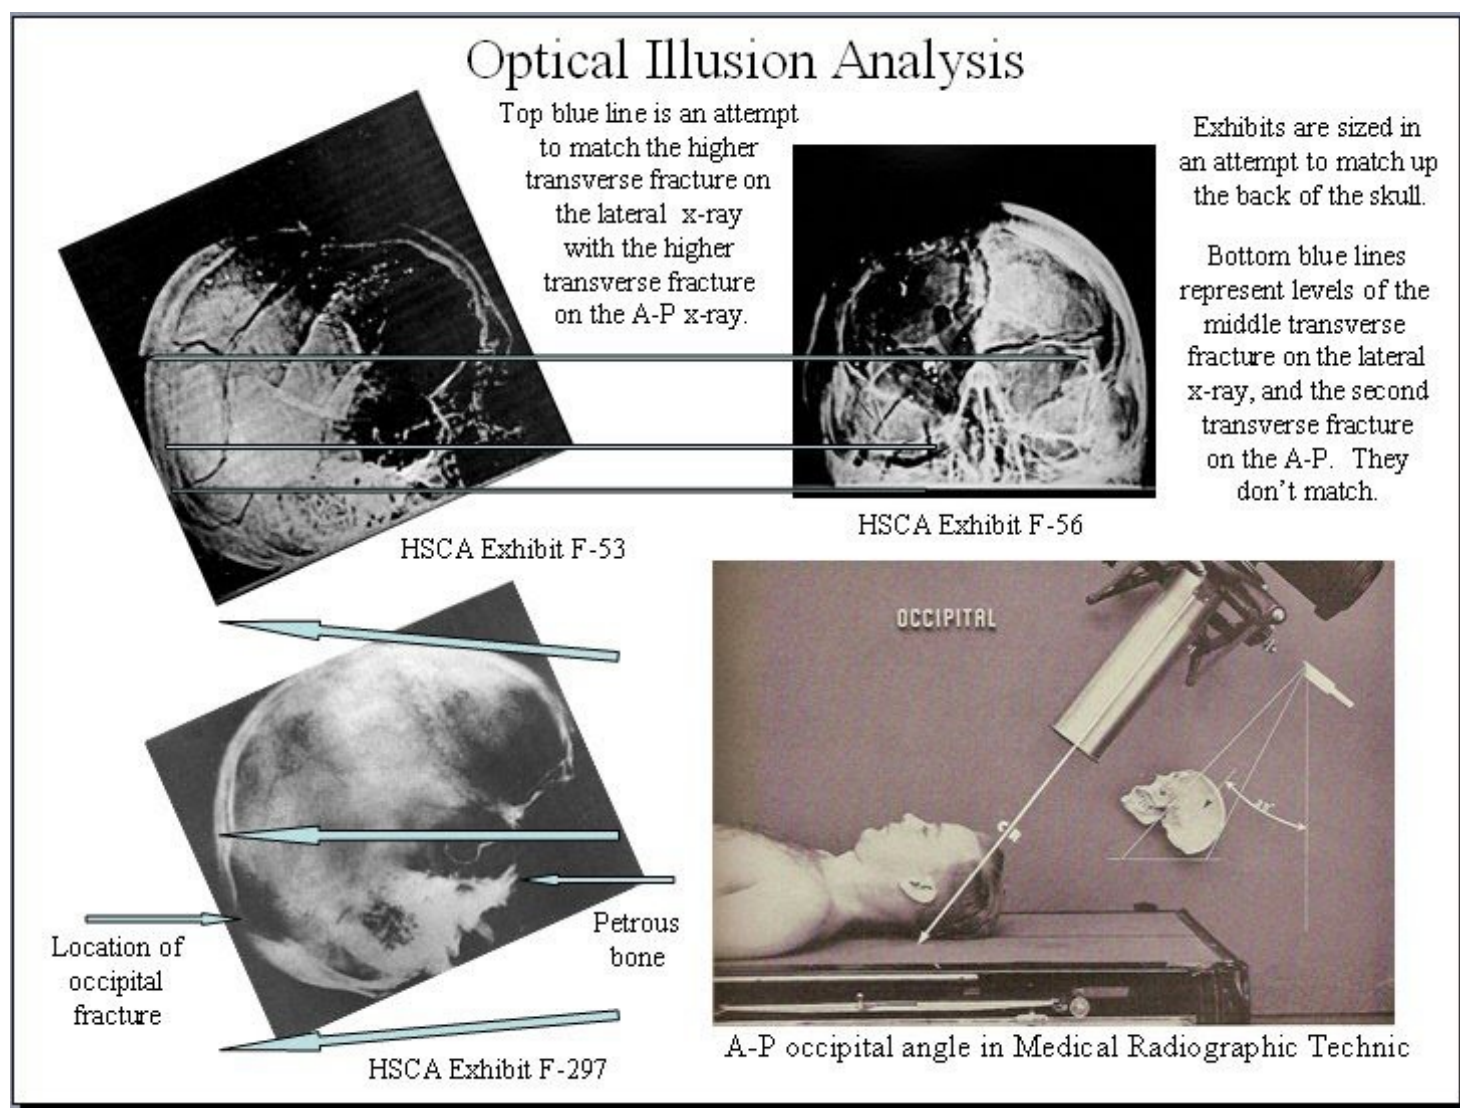

At left and right: A-P and lateral x-rays of an infant. Note that the fractures at the rear of the skull in the lateral view are unseen in the A-P view.

A-P/Lateral X-ray Comparison Comparison

It was while comparing the un-enhanced and enhanced A-P x-rays that I noticed something mighty peculiar. The transverse fracture line presumed to have been in the occipital bone was wider on the un-enhanced x-ray than on the enhanced x-ray. Since the fracture itself would have to be the same in both exhibits, I gathered from this that there was air surrounding the fracture, and that this air became less apparent in the enhanced version. This puzzled me a bit, in part because this fracture seemed like a very sharp line in the lateral x-ray, but even more so because I couldn't figure out what tissue was holding this air. I couldn't imagine the President's brain, as devastated as it was by the bullet striking him near his temple, to have the consistency necessary to contain the air by the occipital fracture. It was then that I realized the transverse fracture was significantly wider in the A-P view than in the lateral view. This made no sense, as a fracture at the back of Kennedy's head should, due to the substantial magnification of Kennedy's face in the A-P view, appear smaller than the lateral fractures when the skulls were made to match.

This led me to roam the internet for a night or two in search of lateral and A-P x-rays of fractures at the back of the head. And I found what I should have suspected all along--that fractures of the occipital region do not show up clearly on A-P x-rays. That is why there are different views of the skull. According to the chapter Skull Trauma, by Bergeron and Rumbaugh, in Radiology of the Skull and Brain, "Most radiologists obtain, at a minimum, right and left lateral views, anteroposterior and posteroanterior views in the Caldwell projection, and anteroposterior and posteroanterior Towne views." The view prescribed for identifying fractures on the occipital bone is the Towne view, which was not attempted with President Kennedy. The Skull Trauma chapter was also educational in that it included a number of A-P and lateral x-rays taken of the same skulls. As suspected, there wasn't one instance where a posterior fracture was larger in proportion on the A-P view than on the lateral view. In several instances, large fractures across the back of the skull could not even be seen on the A-P view. I probed further in order to verify my suspicions.

Optical Illusion Analysis

I looked through the old General Electric guidebook on x-rays I'd found to see if it described the use of A-P views to inspect the occipital bone. I found that yes indeed there was such a projection, but it entailed the patient tucking his chin while x-ray beams were sent through his skull at a 35 degree angle

from above. The portable machine used on Kennedy was not capable of such a maneuver. Neither was Kennedy.

Even so, the HSCA radiologists insisted the fractures visible on the A-P view were on the occipital bone. Dr. G.M. McDonnell stated that from the metal fragment he believed to be on the back of Kennedy's head "stellate type fractures "radiate" into both occipital bones, the right parietal bone and the right temporal bone." Since he was wrong about the fragment, perhaps he was wrong about the fractures as well. But he wasn't alone. Dr. David Davis told the HSCA: "There is a sharply defined linear fracture extending laterally from the metallic fragment into the left side of the calvarium, around the parietal bone to the lateral aspect of the skull." He continued: "two linear fractures extend inferolaterally from the metallic fragment, one into the occipital bone, about 3 cm from the midline, and this fracture crosses the lambdoid suture. The other one is more lateral, and extends down toward the lateral sinus, probably above the lambdoid suture."

The report of the HSCA Forensic Pathology Panel agreed with their consultants on this point: "there is a sharp disruption of the normal smooth contour of the skull...with fracture lines radiating superiorly and inferiorly....at this point there is an irregular, radiopaque, sharply outlined bullet fragment...The location of the missile fragment and transverse fractures of the occipital region of the skull is also apparent in the anterior-posterior x-ray view of the skull...The defect in the skull and the inward beveling thereof provide definite evidence of an entrance wound of the head at a point corresponding to that noted by the panel in the upper back of the scalp."

I decided to match up the back of the head with the A-P view as best I could. Since I'd already matched up the forehead fragment (on the Believing is Seeing slide) and since Joe Durnavich had convinced me the forehead in the A-P x-ray was 20% larger than the back of Kennedy's head, due to magnification, I increased the comparative size of the A-P x-ray in that comparison by 1.2 in order to match up the occipital regions on the two x-rays. I then compared this larger skull to the lateral x-ray and I found what I was afraid I'd find. The transverse fracture in the A-P x-ray is not low enough on Kennedy's skull to be the transverse fracture in the occipital bone on the lateral x-ray. Even worse, when I projected the relevant angles onto Kennedy's pre-mortem lateral x-ray, I saw that the dense petrous bone by Kennedy's ear would be likely to obscure most of his occipital bone in the A-P projection. I concluded that the fractures apparent on the A-P view were almost certainly not in the occipital bone. This would explain why the fractures along the back of Kennedy's head in the A-P view were either invisible or in the wrong place on the lateral view.

The more I thought about it, the more I accepted this possibility. While the fracture in the lateral view disappears into a sinus at the back of Kennedy's head, this sinus is inexplicably invisible in the A-P view. Upon closer examination, the fracture heading into the left side of the skull also fails to match. Along with the other fractures supposedly radiating from the fragment in the A-P view, where are these fractures in the lateral view? The transverse fracture nearest the level of the depressed fracture seems to be on the right side, as it ends at a fracture coming from the large defect by the right temple. The angle that this fracture heads forward seems wrong as well. While it curves downwards in the lateral view it soars upwards in the A-P view. If one is to argue this fracture is not seen on the lateral, because it is on the far side of the skull, then one should explain why the occipital fracture would be so clear on the A-P view. Finally, as this fracture is reportedly a depressed fracture, shouldn't there be a white line reflecting the overlap of bone? According to Skull Trauma by Bergeron and Rumbaugh "the roentgenographic characteristic of the depressed fracture is the line or shadow of increased density caused by overlapping of bony margins or fragments." Keep in mind that when talking of x-rays, white areas are often called shadows. Black is white and white is black.

In February, 2006, I decided to take my findings on the x-rays to an online radiology forum. While my online presentation received hundreds of hits as a result, I received very few comments, positive or

negative. (I took this as a positive; if my findings had been totally off-base, I think these professional radiologists would have told me about it, or at least recommended a book I should read so I could learn what the heck I'm talking about.) Anyhow, I did receive a confirmation for one of my claims—that Kennedy's A-P view would not show his occipital fractures. This confirmation came from a medical radiation technologist. He/she agreed with the official interpretation that Kennedy's head was tilted back considerably in the A-P view but responded to my prodding by stating: "I don't think that a modified Waters view would help with a view of the occiput. You would probably throw the jaw and the teeth over the structures in the occipital region. The cervical spine would also be superimposed on top of the midline of the occiput. The best view would have been the angled down Towne's view...as shown in your photograph. That would toss the face below the level of the occiput and showed the entire bone. In clinical radiography that view is almost always taken. In forensic or autopsy radiography, usually only two views are done--the AP and lateral." I received an e-mail response from a radiologist which offered additional insight. He said "much of the theory about how to shoot AP or PA plain films of the skull and facial bones is designed to get the dense petrous pyramids out of the way... The occipital view for example is designed to throw the petrous pyramids below the foramen magnum."

Years later, when re-reading Harrison Livingstone's book *Killing the Truth*, moreover, I realized that Livingstone had been in contact with Dr. Donald Siple, Chief Radiologist at Maryland General Hospital, and that Siple had told him much the same thing. In an April 16, 1993 letter, reprinted in the book, Siple told Livingstone that a large defect visible on an A-P view would have to be in front, as occipital defects "did not shine through."

This is further confirmed by *Manual of Roentgenological Technique* (1947), which, while listing the prominent features to be studied on an A-P x-ray, listed only features of the front of the skull, such as the orbits (aka the eye sockets), the frontal sinus, and the frontal bone; it failed to even mention the occipital region.

So there you have it. There are good reasons to believe the fracture line low on the A-P view is not on the occipital bone.

Fractured Orbit Analysis

Blow-out fracture of left orbit.

X-ray depicting a blow-out fracture of left orbit.

HSCA Exhibit F-55, A-P x-ray

Fractured Orbit Analysis

So where were the fractures in Kennedy's eye socket on the A-P view actually located? Well, since they appear to be in his eye socket, I thought I'd start by checking there. Once started, I decided to look no further.

Let's recall the words of the doctors in the autopsy protocol (I'll do my best to translate): "There is edema and ecchymosis of the inner canthus region of the left eyelid measuring approximately 1.5 cm in greatest diameter. There is edema and ecchymosis diffusely over the right supra-orbital ridge with abnormal mobility of the underlying bone." (There is swelling and bruising on the inner part of the left eyelid. There is swelling and bruising and a noticeable bone fracture above the right eye socket.) Let's recall that Boswell's drawing of Kennedy's skull on the back of the face sheet, entered into evidence as part of HSCA exhibit F-44, depicts a shattered eye socket with the notes "Globe rt. Eye" and "fracture through floor." (A globe fracture is a structural collapse of the eye.) These are indications that the President's eye sockets were fractured. When asked by the ARRB to explain his notes on the skull drawing, Boswell stated: the "fracture through the bone extended from the frontal bone and through the floor of the orbit." Case closed. Kennedy had fractured orbits (eye sockets).

So why didn't the HSCA's chief radiology consultant, Dr. G. M. McDonnell, mention any fracture lines visible in the orbits on the A-P view? After all, the A-P view portrayed the face 20% larger than the

back of the head and the fractures should have been readily apparent.

They were certainly apparent to others. In a March 1993 defense of the single-assassin theory published in the Journal of the American Medical Association, Dr. Robert Artwohl, while trying to refute those believing the X-rays showed the right side of Kennedy's face to be missing, claimed "The swollen and ecchymotic right orbit seen in the autopsy pictures and Humes' description of the instability of the face in this area correspond precisely to the extensive right orbital fracture and frontal bone fractures seen on the available roentgenograms." He later expanded on these comments in a September 11, 1994 e-mail to a JFK assassination newsgroup, reporting that "The right orbit is fractured in *several* places." Similarly, a 1977 HSCA contact report with one of their consultants, Dr. Norman Chase, entered into evidence as Exhibit F-34, claims that when shown the x-rays, Dr. Chase "noted fracture of the right orbit." Chase's appraisal, moreover, supported the analysis of the other radiologist contacted by the HSCA in 1977, Dr. William Seaman, who told them that "Fractures were evident through the upper part of the right eye, including the top and bottom of the right orbit," and that, in addition, "The bottom of the frontal sinus was fractured." Even further back, Dr. Fred Hodges, in his 1975 report to the Rockefeller Commission, observed "multiple extensive fractures involving the cranial vault and orbits" and then specified that fracture lines "reached" into the left orbit, implying that these fractures started elsewhere, like the right orbit.

These statements led me to wonder if what McDonnell thought was a transverse fracture on the occipital bone in the A-P view could instead be the fractured right eye socket noted at autopsy, and then subsequently noted by Dr.s Hodges, Chase, Seaman, and Artwohl.

My wondering came to an end with the discovery of an x-ray depicting a blow out fracture of a man's left orbit. This fracture created the wide air-filled shape apparent in Kennedy's original A-P x-ray in the exact same place on the skull. The Merck Index defines a blow-out fracture as: "fracture of the orbital floor caused by a sudden increase of intraorbital pressure due to traumatic force; the orbital contents herniated into the maxillary sinus so that the inferior rectus or inferior oblique muscle may become incarcerated in the fracture site, producing diplopia on looking up." That air had filled the maxillary sinus (a sinus—cavity—below the eye socket) would seem to explain the air surrounding the supposed occipital fracture apparent when one compares the un-enhanced x-ray to the enhanced x-ray. That air was in this sinus, and that this proved the orbit was damaged, and this "fracture" on the face, was not just my opinion, moreover, as the head radiology tech at the autopsy, Jerrol Custer, claimed as much in his ARRB testimony.

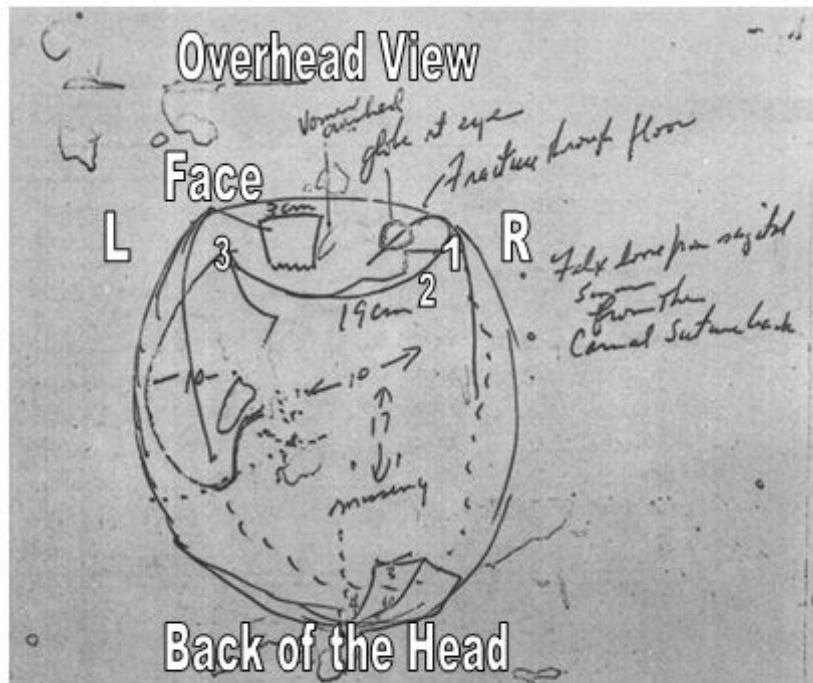

But what of the other fracture lines apparent in the A-P view? While reading about blow-out fractures, I found a number of drawings depicting what are known as Le Fort fractures. These fractures appeared similar but not identical to Kennedy's fractures. An online article by the Skull Base Institute entitled Craniofacial and Skull Base Trauma states: "forceful impact to the skull can cause a fracture along the weak points of the orbit....Le Fort III fractures....progress laterally along the entire orbital floor and extend to disrupt the zygomaticofrontal suture...Le Fort III fractures result in complete craniofacial dysjunction because the facial bones and structures of the middle third of the face become totally separated from the cranium...Since most facial trauma consists of blows from the side or slightly off center, ideal, symmetric Le Fort I, I, or III patterns are rarely followed. Most Maxillary fractures are more comminuted on one side than the other. Thus Le Fort fractures may be seen in any combination." I took from this article that a Le Fort fracture would help explain the "abnormal mobility of the underlying bone" discussed in the autopsy report. It also convinced me that Kennedy's fractures need not look exactly like the drawings of Le Fort fractures, and, in fact, shouldn't look exactly like these drawings, due to the fact his fractures came from behind and were created in part by an actual impact of a missile on the orbital rim. But I needed a second opinion.

Another online article, Orbit Fractures, by Antonio Pascotto on the eMedicine website, discussed Le

Fort III fractures in a similar manner: “This fracture rarely results in a single segment of bone; more commonly, the break is comminuted, with varying combinations of zygomatic, nasoethmoid, and orbital fractures. (Translation: fractures involving the cheek bone, nose, and eye sockets.) The fractures may not be symmetric on both sides, and minimal mobility may be present... Orbital emphysema, when detected on plain images, is frequently from a blow fracture of the medial wall...an air-fluid level in the maxillary antrum suggests an orbital floor injury...Unilateral base opacification of the ethmoid air cells would suggest a medial wall fracture.” While I still haven’t figured out exactly how to detect “unilateral base opacification of the ethmoid air cells” the line about orbital emphysema intrigued me, as both of Kennedy’s eye sockets appear to be darkened in the A-P view. In *Radiology of the Skull and Brain* I found an x-ray depicting such emphysema (air) in the eye sockets and found that, as on Kennedy’s x-rays, the air collects at the top of the eye socket.

Another eMedicine article entitled *Facial Trauma, Maxillary and Le Fort Fractures* by David W Kim confirmed much of what I’d already read: “In reality, the Le Fort classification is an oversimplification of maxillary fractures. In most instances maxillary fractures are a combination of the various Le Fort types. Fracture lines often diverge from the described pathways and may result in mixed type fractures, unilateral fractures, or other atypical fractures. In addition, in very high energy blows, maxillary fractures may be associated with fractures to the mandible, cranium, or both.” (Maxillary fractures are, by the way, fractures involving the Maxilla, the bone stretching from the upper jaw to the lower eye socket.) In Kim’s discussion of Le Fort III fractures I noticed something new, however: “Intanasally, a branch of the fracture extends through the perpendicular plate of the ethmoid, through the vomer, and through the interface of the pterygoid plates to the base of the sphenoid.” What I noticed was this reference to the Vomer bone, a small bone underlying the nose. Included in Dr. Boswell’s notes on the back of the face sheet are two words that have always intrigued me: “Vomer *crushed*.”

Crash Go the Consultants

A comparison of Dr. Boswell's drawing of JFK's skull on the autopsy protocol (CE 397, at left) and President Kennedy's enhanced X-ray (HSCA Exhibit F-56, at right), confirms that the only fracture line starting low on the right side and crossing over to the left side began in the fractured floor of his right eye socket, at the top of the drawing. (For ease of comparison, three points along this fracture line have been added.)

Did any of the radiologists subsequently consulted even consult Boswell's drawing? Were they even aware of its existence?

Crash Go the Consultants

A look at Dr. Boswell's drawing of Kennedy's skull further supports that the supposedly occipital fractures on the A-P x-ray were actually fractures of the right orbit. In the forehead area of this drawing, created during the autopsy, there is a notation reading "19cm." When asked in his ARRB testimony if this notation referred to the length of a scalp laceration, Boswell replied "there was an incised wound up there that extended into the right eye socket and then back across his temporal and frontal bone" and then explained further "The bone was all fragmented for that distance, 19 centimeters across the frontal bone." When one follows the line from the fractured floor of the eye socket on the drawing, furthermore, one can see that it rises up and curls over to the left side of the skull. This mirrors the fractures on the x-ray supposedly radiating from an entrance wound on the back of the skull. That the fractures purported to be on the back of Kennedy's head were in fact in his eye sockets is further supported by the not surprising fact that, in Boswell's drawing, there are NO fractures starting low on the back of the skull and curling over to the left side.

Let's recall here the precise words of chief HSCA radiology consultant Dr. G. M. McDonnell. He concluded there was: "A metallic fragment on the outer table of the right occipital bone 9.6 cm above the mid-portion of the External Occipital Protuberance (EOP). 1 cm above the metallic fragment is a depressed fracture from which stellate type fractures "radiate" into both occipital bones, the right

parietal bone and the right temporal bone. *These are vividly and convincingly displayed in the enhanced images, specifically the "anteroposterior" (AP) projection of the skull.*" From this it seems clear his incorrect belief the fragment was on the back of the head fed into his belief these fractures were on the back of the head. He'd compounded his mistake by twisting the evidence to support it.

Or maybe he was just covering up. In any event, he was not alone. The other HSCA radiology consultant shown the enhanced x-rays, Dr. David O. Davis, also came to the conclusion there was a bullet fragment on the back of the head and that fractures radiated outwards from this fragment. While McDonnell had noted "fracture lines through the anterior and posterior aspects of the right frontal sinus," moreover, Davis noted that the right orbit was fractured in the roof, right side and inferior rim. One can only wonder then which fractures on the A-P x-ray they'd connected with the occipital fracture and which ones with the sinus and orbital fractures. Still, it seems likely Davis associated the fracture lines around the outside of the orbit with fractures of its roof, right side and rim, and the fractures cutting across the orbit and heading to the left side of the skull with fractures in the occiput. If so, then one can only wonder if he'd ever been shown the drawing made by Boswell at the autopsy, which clearly depicts the fracture just below point 2 on the slide above in the eye socket, and the fracture line connecting point 2 with point 3 on the left front of Kennedy's head, and no fractures radiating from the cowlick area.

And, should one continue to doubt that the HSCA's radiology consultants were pressured or deceived into concluding that the large fragment and transverse fractures on the A-P x-ray were on the back of Kennedy's head, when they were really behind Kennedy's eye, one need only read the ARRB reports on their meetings with their own consultants. Dr. Douglas Ubelaker, their forensic anthropology consultant, could not find an entrance on the back of the skull on either the A-P or lateral x-rays, and noted no fracture lines on the A-P x-ray, but nevertheless related that "the orbit of the right eye appears displaced on the A-P x-ray." Dr. John J. Fitzpatrick, their forensic radiology consultant, also saw no entrance on any of the x-rays, and also failed to note fractures on the back of the head in the A-P x-ray, and similarly noted that "the orbit of the right eye is cracked and displaced." And, finally, Dr. Robert Kirschner, their forensic pathology consultant, completed the trifecta--he noted no entrance wound on any of the x-rays, noted no fractures in the A-P x-ray, and related instead that "The rear of the right orbit was observed to be missing."

That's three for three. Three consultants, all of whom failed to note fractures on the back of the head in the A-P x-ray, and all of whom offered that the damage visible in the A-P x-ray was in the orbit.

And oh, by the way, on this point, I am not at odds with Dr. Mantik. In an unpublished manuscript written before he was allowed to view the x-rays, and measure their optical density, Dr. Mantik discussed other aspects of the x-rays which he considered of interest. This manuscript was excerpted in Harrison Livingstone's 1993 book *Killing the Truth*. Even so, in 2011, while looking back through the book, I was astounded to find that Mantik had observed, long before I, that the fracture lines the HSCA's panel thought derived from the cowlick entrance did not actually come from that location, and that "On the contrary, based on the radiographs and on Boswell's diagram, several of these obvious fracture lines may lie in the inferior orbital rim and not on the posterior skull at all." He then proceeded to quote Dr. Seaman in support of this analysis.

And so, yes, surprisingly, on this point, Dr. Artwohl, Dr. Mantik, and myself, agree. As do the far more qualified and presumably impartial consultants hired by the ARRB...

Anyone out there still convinced these fractures were on the back of the head, and not in the orbit, should feel free to chime in... But you're wrong.

Lincoln/Kennedy Comparison

Abraham Lincoln,
The 16th President.

Lincoln/Kennedy Comparison

When one compares the deaths of President Lincoln and President Kennedy, there are many striking similarities. Some of these similarities involve the wounds themselves. In both cases there were controversies about the direction that the bullet passed through the skull. Dr. Joseph Woodward performed Lincoln's autopsy and reported that the round bullet lodged above Lincoln's left eye. Surgeon General Joseph Barnes reported that it lodged above the right eye. Lincoln's family physician Robert King Stone took notes at the autopsy; these notes were published almost a hundred years later; they largely backed up Woodward.

Another similarity is that, as a result of the bullet's impact, both men suffered fractures of both of their eye sockets. This is a frequent occurrence in severe head wounds. The bones at the back of the eye sockets are particularly thin and prone to collapse from increased intra-cranial pressure. Dr. Vincent J.M. Di Maio writes "The production of secondary fractures of the skull in gunshot wounds of the head is dependent on two factors: the range at the time of discharge and the kinetic energy possessed by the bullet. The most common sites for secondary skull fractures are the paper-thin orbital plates. These are extremely sensitive to a sudden increase in intra-cranial pressure such as that produced by a bullet entering the cranial cavity." Let's compare... The bullet striking Lincoln in the back of his head and causing his eye socket fractures weighed approximately 6.7 grams or 103 grains and was traveling at

approximately 400 fps. The bullet purportedly striking Kennedy at the back of his head weighed approximately 10.4 grams or 160 grains and was traveling at approximately 1800 fps. Since the basic formula for estimating energy release in tissue is mass x speed x speed, this means that Kennedy's skull was subjected to an impact over 30 times as great as Lincoln's. (While the actual amount of energy released into Kennedy's skull would be substantially less than this amount, as pieces of the fatal bullet exited the skull before depositing all their energy, it remains clear that the amount of energy deposited in Kennedy's skull was substantially larger than the amount of energy deposited in Lincoln's.)

So where are these orbital fractures on Kennedy's x-rays? Until these fractures or lack thereof are adequately explained, there is no reason to believe that the fractures on the A-P x-ray supposedly on the back of Kennedy's head are anywhere but his eye sockets.

While some might say "case closed", the fact is that, for me, the case will remain open. I have created this webpage, in part, to encourage a more open and intelligent discussion of the medical evidence related to the assassination of President Kennedy. I don't pretend to be an "expert" on any of the topics discussed in these chapters. And yet it seems I've uncovered many issues not addressed by the so-called experts. I await the response and criticisms of those more familiar with this subject matter than myself, and will update this webpage accordingly.

Chapter 18c: Reason to Doubt

Why I can't buy what so many others are selling

Who to Believe?

to Dr. Robert McClelland.

Who to Believe?

When I first started presenting my evidence for a new perspective on the President's wounds in 2004, I expected there to be a tremendous amount of resistance from single-assassin theorists, and a moderate amount of acceptance from conspiracy theorists. Boy, was I wrong. The single-assassin theorists I've encountered refuse to deal with the evidence beyond repeating what they've read in books by the Warren Commission, Lattimer, Posner, and Bugliosi, or the website of John McAdams. Anything outside of that they pretty much tell you you are lying, and ignore. No, the most resistance I've received has not been from those opposed to my conclusion more than one shooter fired on Kennedy on 11-22-63, but from those who agree with that conclusion.

You see, many conspiracy theorists are, in the words of Bono, "stuck in a moment and they can't get out of it." That moment, to be clear, is the one in which they first realized the majority of those observing Kennedy's wounds at Parkland Hospital claimed to see an open wound on the back of Kennedy's head. Such a wound, of course, is not shown in the autopsy photos, nor reported in the autopsy report, which details a number of significant scalp lacerations, but none on the back of the head. My suspicion is then that the majority of those experiencing this moment,--an epiphany as Doug Horne calls it--have come to believe either that the autopsy photos showing no wound on the back of the head are fake, and the autopsy a lie, or that someone altered Kennedy's body between Dallas and the beginning of the official

autopsy at Bethesda.

Many doing so claim the autopsy face sheet supports their conclusion, and note that Dr. Boswell's description of a 17 by 10 cm wound encompassing the majority of the right side of the President's head is far larger than the wound observed in Dallas, and suggests the wound as seen at Bethesda included the back of the head wound seen at Parkland. Those doing so, however, are engaged in self-deception. As stated, no large scalp lacerations in the occipital region of the skull were noted at autopsy. The autopsy protocol signed by Boswell, moreover, explains: *"Upon reflecting the scalp multiple complete fracture lines are seen to radiate from both the large defect at the vertex and the smaller wound at the occiput. These vary greatly in length and direction, the longest measuring approximately 19 centimeters. These result in the production of numerous fragments which vary in size from a few millimeters to 10 centimeters in greatest diameter."*

Note that the large defect is at the vertex--the top of the head. Note also that the *"multiple complete fractures lines...result in the production of numerous fragments."* In other words, the right side of Kennedy's head was smashed to pieces. The 17 by 10 measurement is therefore most obviously the measurement of the large head wound after the scalp was reflected, and numerous bone fragments stripped from the skull. The inability of so many to grasp something so obvious is a bit maddening, to say the least.

In any event, while still others believe the autopsy photos of the back of the head are not fake, but reflect instead the appearance of the body at the end of the autopsy and not the beginning, the fact is that all of these theories--which are collectively held by the vast majority of conspiracy theorists--are built around a core belief: the Parkland witnesses COULD NOT be mistaken. This belief is, in my opinion, a mistaken one.

To best explain my lack of faith in the accuracy of the Parkland witnesses, we need to go back to the beginning...

At approximately 12:45 P.M., within 15 minutes of Kennedy's being shot, assassination witness **William Newman**, who was less than 30 feet to the side of Kennedy when the fatal bullet struck, was interviewed live on television station WFAA. This was 45 minutes before the announcement of Kennedy's death. Newman told Jay Watson: *"And then as the car got directly in front of us, well, a gun shot apparently from behind us hit the President in the side, the side of the temple."* As he said this, he pointed to his left temple, with his only free hand. (This image is reversed on the slide above.)

At 1:17, about a half hour later, Watson interviewed **Gayle Newman**, who'd been standing right beside her husband and had had an equally close look at the President's wound. She reported: *"And then another one—it was just awful fast. And President Kennedy reached up and grabbed--it looked like he grabbed--his ear and blood just started gushing out."* (As she said this she motioned to her right temple with both of her hands. In 1969, while testifying at the trial of Clay Shaw, Mrs. Newman would make the implications of this even more clear, and specify that Kennedy *"was shot in the head right at his ear or right above his ear..."*)

Okay so that's two for two. Two witnesses, BOTH of whom saw the bullet impact by Kennedy's ear. But they only saw Kennedy for a second. Maybe they were mistaken. If they were correct, certainly someone seeing Kennedy at Parkland Hospital would have noticed the wound they describe by Kennedy's temple, and have mentioned it on 11-22-63.

Someone did. At 1:33 p.m. on November 22, 1963, Assistant Press Secretary Malcolm Kilduff announced President Kennedy's death from Parkland Hospital. He told the country: *"President John F. Kennedy died at approximately one o'clock Central Standard Time today here in Dallas. He died of a gunshot wound in the brain...Dr. Burkley [Kennedy's personal physician] told me it is a simple*

matter...of a bullet right through the head. (At this time, as shown on the slide above, he pointed to his right temple) . . . *It is my understanding that it entered in the temple, the right temple.*” As Dr. Burkley had seen Kennedy in the Dallas emergency room and was later to tell the HSCA that Kennedy’s wounds didn’t change between Dallas and Bethesda, the site of the autopsy, Kilduff’s statements are a clear indication that the large head wound depicted in the autopsy photos is in the same location as the large head wound seen at Parkland Hospital. That no one at the time of Kilduff’s statement had noted a separate bullet entrance anywhere on Kennedy’s head, moreover, suggests that Burkley had seen but one wound, a wound by the temple, exactly where Newman and his wife had seen a wound.

But wait, there’s more... Less than forty minutes after the announcement of Kennedy’s death, eyewitness **Abraham Zapruder** took his turn before the cameras on WFAA, and confirmed the observations of Burkley and the Newmans. Describing the shooting, Zapruder told Jay Watson: *“Then I heard another shot or two, I couldn’t say it was one or two, and I saw his head practically open up, all blood and everything* (at this time, and as shown on the slide above, Zapruder grabbed his right temple), *and I kept on shooting. That’s about all, I’m just sick, I can’t...”*

This means that there were four witnesses to comment on the location of Kennedy’s head wound prior to the approximately 2:16 press conference at Parkland Hospital, in which Dr. William Kemp Clark claimed the wound was on the "back of his head," and all of them had specified the wound to have been on the side of Kennedy’s head, where it was later shown to be in the autopsy photos and Zapruder film. Now ain’t that a humdinger!

Now, I know what some of you are thinking. You’re thinking, "but Pat you’re cherry-picking witnesses to support your silly notion that the Parkland witnesses were wrong and that the bullet striking Kennedy at frame 313 did not exit the back of his head." Well, first of all, I don’t believe my noting that the earliest witnesses all said that a bullet hit Kennedy by the temple is silly, particularly in that three participants to Kennedy’s autopsy--radiologist Dr. John Ebersole, radiology technician Jerrol Custer, and autopsy assistant James Curtis Jenkins--all left the autopsy with a similar impression a bullet struck Kennedy by the temple. And second of all... Well, have it your way. Let’s go through the statements of the best witnesses to the shooting.

By Way of Illustration

When one studies the photos of the tattoo at far right it becomes clear that the line of missing skull on Groden autopsy photos 1 and 2, are also consistent with photo 3. The line of missing skull aligns with the top of Kennedy's ear. The photos of the tattoo demonstrate that this line would be just out of sight in autopsy photo 3, just where Dr. Boswell's bloody thumb has hooked the opening in the skull.

Above and below: photos found online of a tattoo taken from above and behind.

By Way of Illustration

But first, a confession. I was once one of you... Yes, that's right. When I first began my personal investigation of the evidence, I suspected much of the medical and photographic evidence had been altered. But this passed with time. It just didn't make any sense to me that if the Zapruder film, the autopsy photos and the x-rays were faked, that they would so clearly demonstrate that Kennedy was killed by a conspiracy. I mean, if the conspirators were slick enough to kill Kennedy and get away with it, wouldn't they be slick enough to create autopsy photos that show a brain with damage consistent with an entrance by the EOP? Wouldn't the doctored x-rays show the trail of fragments where Dr. Humes said it was, corresponding with a line joining the entrance by the EOP and the right supra-orbital ridge? I mean, wouldn't they?...Then why didn't they?

This led me to take a much closer look at the back of the head photo, the one photo I felt positive had been faked. Not only did this photo not jive with the Parkland doctors' description of Kennedy's head wounds, it didn't appear to jive with the other photos. It was then that I realized this photo was taken after the establishing shots of Kennedy on the table, and after the wing of bone had been pulled from the scalp flap by his temple, and after the blood had been rinsed from his hair. I still suspected that the large defect in the photo was in a different location than the other photos, however. I tried to think of ways to compare the large head wound's location with its location in the other photos. I ended up looking at photos of tattoos on the top of the head when taken from different angles, to see if a wound above the ear would even be seen in a photo taken from the angle of the back of the head photo.

In time, I concluded the large defect in the back of the head photo was in the same location as in the other photos.

I still had questions, though. Big ones. Why didn't this photo show the large head wound on the back of the head described by the Parkland witnesses?

Were ALL the photos faked to show the large head wound described by the doctors at a point higher up

on the skull? And, if so, why did the very first witnesses to describe the wound place it where it is on the autopsy photos, in front of and above Kennedy's right ear? Were these witnesses lying?

The Invisible Hole

Below: a crop from a photograph taken by Mary Moorman about 1/10 of a second after the right side of Kennedy's head exploded. At right: a crop from frame 317 of the Zapruder film, taken about 1/10 of a second after the Moorman photo was taken.

At right: the "back of the head" autopsy photo, presumably of Kennedy, in which the large hole missing scalp and bone described by Kennedy's emergency room doctors fails to make an appearance at its purported location on the back of his head. As this hole failed to appear in this location on any of the photos of the shooting itself, moreover, it seems reasonable to assume that the hole was not in this location, but where the photos show it to be, above and in front of Kennedy's right ear. This possibility is further supported by the strange coincidence that none of the doctors noting a wound on the back of the head saw one in front of the ear.

Of course, some refuse to accept that these doctors could be so mistaken, and instead choose to believe that the entire photographic record has been faked. They overlook, however, that the statements of those witnessing the shooting support the accuracy of the photos, and not the doctors.

The Invisible Hole

I think not. Not only did the earliest witnesses to describe the location of the large wound on Kennedy's head seem to believe it was on the side of his head, the vast majority of the witnesses seeing the bullet's impact would continue to claim it struck Kennedy on the side of his head, and fail to note any explosion whatsoever from the back of his head.

As we've seen, the Newmans and Zapruder, standing on Kennedy's right side, all thought the bullet struck Kennedy on the right side of his head, by his right temple. But they weren't the only witnesses on the right side of Kennedy to note an impact on the side of his head.

Dealey Plaza groundskeeper **Emmett Hudson**, who was standing on the steps to the right and front of Kennedy at the moment of the fatal head shot, also discussed its impact. In his testimony before the Warren Commission, Hudson asserted: *"it looked like it hit him somewhere along a little bit behind the ear and a little bit above the ear."* While this is a few inches back of the location described by the Newmans and Zapruder, it is more significantly not a description of a bullet exit on the far back of

Kennedy's head, where most conspiracy theorists have long held the large head wound was located.

"Well, wait a second"--I'm sure some of you are thinking--"maybe Hudson, along with the other witnesses, saw the bullet's entrance, and missed seeing the exit of this bullet from the back of Kennedy's head due to their being slightly in front of Kennedy." Well, no, that doesn't work, either.

In 1966, **Marilyn Sitzman**, Abraham Zapruder's secretary, who'd stood beside him on 11-22-63, confirmed his observation of the wound location. To writer Josiah Thompson, she related: *"And the next thing that I remembered correct ... clearly was the shot that hit him directly in front of us, or almost directly in front of us, that hit him on the side of his face ..."* When asked then by Thompson to specify just where she saw the large head wound, she continued: *"I would say it'd be above the ear and to the front...Between the eye and the ear...And we could see his brains come out, you know, his head opening. It must have been a terrible shot because it exploded his head, more or less"*. Hmmm... Sitzman, as Zapruder, was almost directly to the right of the President at the moment of the fatal bullet's impact. This put them in perfect position to note an explosion from the back of Kennedy's head. And yet neither of them saw such an explosion.

Even worse, at the moment of the fatal bullet's impact, the Newmans were approximately 6-8 feet behind the President, and about 20 feet to his right. Kennedy, at this time, was turned slightly left. This means the Newmans were looking directly at the back of Kennedy's head at the moment of the fatal bullet's impact... And yet both of them noted that this impact was by his ear!

Still, that's just four witnesses in a strong position to note whether the bullet exploded from the side or back of Kennedy's skull, all of whom said "side." What about the closest witnesses in the motorcade behind Kennedy? Didn't any of them see an explosion from the back of his head?

Uhhh...nope. Motorcycle officer **James Chaney**, riding just a few yards off Kennedy's right shoulder, was interviewed by WFAA on the night of the shooting. He reported: *"We heard the first shot. I thought it was a motorcycle backfiring and uh I looked back over to my left and also President Kennedy looked back over his left shoulder. Then, the, uh, second shot came, well, then I looked back just in time to see the President struck in the face by the second bullet."* Wait... What? Struck in the face? Apparently, Chaney, as Sitzman, considered the space between the eye and the ear the side of the face. While some might wish to believe Chaney was describing the impact of a bullet entering Kennedy's face and exiting from the back of his head, this in fact makes little sense, as Chaney said in this same interview that he thought the shot had come from *"back over my right shoulder."* We should also consider that WFAA's interview of Chaney took place on the night of the assassination...in the hall of the Dallas Police Station as Oswald was being questioned. By that time, Chaney had to have been told a rifle had been found in the depository behind Kennedy's position at the time of the shooting. If Chaney believed Oswald had fired the shots, as one would suspect since he thought the shots came from behind, and had seen an explosion of any kind from the back of Kennedy's head--entrance or exit--wouldn't he have said so?

And shouldn't the motorcycle officer riding directly to his right, **Douglas Jackson**, also have reported such an explosion? Jackson's notes, written on the night of the assassination and published in 1979, relate: *"I looked back toward Mr. Kennedy and saw him hit in the head; he appeared to have been hit just above the right ear. The top of his head flew off away from me."*

Well then, what about the officers riding on the other side, unable to see the right side of the President's face? If there had been an explosion from the back of Kennedy's head, entrance or exit, they would not have been distracted by an entrance or exit by Kennedy's ear. So what did they see?

While the motorcycle officer on the far left of the limo, B.J. Martin, said he did not even see the head shot, the officer to his right, **Bobby Hargis**, riding off Mrs. Kennedy's left shoulder, was not so lucky. In an 11-24-63 eyewitness account published in the New York Sunday News, he wrote: *"As the*

President straightened back up, Mrs. Kennedy turned toward him, and that was when he got hit in the side of the head, spinning it around. I was splattered by blood." In 1968, in an interview with Jim Garrison's investigators, Hargis would later confirm: *"If he'd got hit in the rear, I'd have been able to see it. All I saw was just a splash come out on the other side."*

Okay, now, that's eight witnesses, all of whom said the kill shot impacted on the side of the President's head, and none of whom noted an explosion or wound on the back of his head.

We now move to the witnesses directly behind Kennedy, in perfect position to note an explosion from the back of his head. These witnesses rode in the Secret Service back-up car, trailing the limousine by just a few yards. **Sam Kinney**, the driver of this car, wrote a report on the night of the assassination which asserted *"At this time, the second shot was fired and I observed hair flying from the right side of his head..."* Sitting next to Kinney was **Emory Roberts**, sitting directly behind Kennedy. If a bullet hit Kennedy on the back of the head, or erupted from the back of his head, he would have been the one to notice. Instead, in an 11-29-63 report, he wrote *"I saw what appeared to be a small explosion on the right side of the President's head, saw blood, at which time the President fell further to his left."*

On the left running board of the back-up car were two agents, neither of whom commented on the bullet's impact or wound location in their initial reports.

One of the agents on the right side of the limo, **Paul Landis**, however, described the impact in a graphic manner. In a report written 11-29-63, he noted *"I heard a second report and saw the President's head split open and pieces of flesh and blood flying through the air."* While vague, this might indeed suggest a bullet's exploding from the back of Kennedy's head.

But between the agents on the left and right sides of the limo sat four more witnesses, two on the jump seat, and two on the rear seat. While Kennedy's close aide **Kenneth O'Donnell** failed to describe the impact of the fatal bullet or head wound location in his Warren Commission testimony, he and the man sitting next to him on the jump seat, **Dave Powers**, would in 1970 publish a book on Kennedy, which described: *"While we both stared at the President, the third shot took the side of his head off. We saw pieces of bone and brain tissue and bits of his reddish hair flying through the air..."* These were Kennedy's friends, both of whom felt one or more shots came from the front, and yet neither of them claimed to see an explosion from the back of Kennedy's head. Years earlier, in fact, Powers had provided a statement to the Warren Commission, which described: *"there was a third shot which took off the top of the President's head..."* Thus, O'Donnell and Powers felt the explosion was on the top and side of the President's head--and not on the far back of his head, where so many conspiracy theorists fervently believe the wound was located.

Their impression was shared by **George Hickey**, one of the two Secret Service agents on the rear seat of the back-up car. On the night of the assassination, he wrote a report on what transpired in Dallas, and noted: *"it seemed as if the right side of his head was hit and his hair flew forward."* Next to Hickey sat **Glen Bennett**, who noted, in a handwritten 11-22-63 report, that the fatal bullet *"hit the right rear high of the President's head."* While some might take Bennett's statement to indicate he saw the entrance of a bullet near Kennedy's cowlick, the entrance location later "discovered" by the Clark Panel, a more logical assessment would be that he saw an explosion of brain and blood from the right side of Kennedy's skull, to the rear of his head, as in not on his face, and high, as in the highest part of his head visible from behind. This, not coincidentally, would be the top of Kennedy's head above his ear, the location of the impact shown in the Zapruder film. (Should one not agree with this assessment one should feel free to explain how Bennett could have seen an impact at the small red shape seen in the autopsy photos, and fail to note the massive explosion from the gaping hole on the right side of Kennedy's head seen in the Zapruder film, especially when no blood can be seen exploding from the back of Kennedy's head in the film.)

In sum, then, none of the closest witnesses to the side or back of the President saw a bullet impact on or explode from the back of his head. So why is it, again, that so many believe there was a wound on the back of his head? Oh, that's right. ALL those who saw Kennedy at Parkland Hospital said the wound they saw was on the back of his head.

Well, not all... As we've seen, Dr. Burkley, long before the Dallas doctors convened their press conference and told the world the large head wound was on the back of Kennedy's head, had already explained to press secretary Malcolm Kilduff that the wound was in fact by the temple.

And he wasn't the only one at Parkland to make this assessment. **Hurchel Jacks**, the driver of Vice-President Johnson's car in the motorcade, arrived at the hospital just moments after the limousine, and witnessed the removal of the President's body from the limo. On 11-28-63, less than a week after the assassination, he filed a report (18H801) and noted: *"Before the President's body was covered it appeared that the bullet had struck him above the right ear or near the temple."*

And Smith wasn't the only one viewing the President at this time. While I've yet to find a direct description of Kennedy's head wound from **Senator Ralph Yarborough**, a passenger in the car driven by Jacks to Parkland Hospital, reporter Charles Roberts, who arrived just a few minutes after Jacks and Yarborough, was later to describe Yarborough's response to his questions about the nature of Kennedy's head wound. In his 1967 book *The Truth About the Assassination*, Roberts recalled that as a horrified Yarborough responded *"I can't tell you,"* he unconsciously held *"his hand to the right side of his head, where he had seen blood streaming from the President."*

And, should one wish to write-off Roberts' reporting on Yarborough as unreliable, seeing as he was by 1967 a vocal defender of the Warren Commission, one should take into account that **Merriman Smith**, who won a Pulitzer Prize for his reporting on the assassination, actually saw Kennedy outside Parkland, and had a similar appreciation of his wound. Now, to be clear, he never saw the wound, and his initial reporting that *"President Kennedy was shot in the right temple"* undoubtedly came from Kilduff. But his early reports--sent across the wires before he arrived at Air Force One about 2:30--nevertheless made clear where the wound was not. In papers such as the *Milton Evening Standard*, Smith reported that as he approached the limousine outside Parkland *"The President was slumped over in the backseat of the car face down. Connally lay on the floor of the rear seat. It was impossible to tell at once where Kennedy was hit, but bullet wounds in Connally's chest were plainly visible, indicating the gunfire might possibly have come from an automatic weapon."* If the President was lying face down, and there was a gaping wound on the back of his head, as so many have come to believe, well then why didn't Smith see it, and report it? That Smith was just reciting an official lie he'd been told doesn't hold water. He had, within this same paragraph, after all, suggested that Connally had been wounded by someone firing an automatic weapon. That someone, it follows, could not have been Oswald.

And Smith wasn't alone when he observed the President's wounds. Standing near him, if not beside him, was his competitor, **Jack Bell** of the Associated Press. So how did Bell describe the wound? Much as Smith, he didn't. Not directly. Instead, the AP's earliest articles on the assassination, such as that found in the 11-23-63 *Spokane Spokesman-Review*, reflect that *"At the hospital emergency entrance, AP reporter Jack Bell saw the President stretched out, face down at full length, motionless on the back seat of the car. His suit still looked neat--but there was blood on the floor."* Well, if he was willing to conjure up the gruesome image of blood pooling up on the floor, wouldn't he have been willing to say he saw a hole on the back of Kennedy's head, should he actually have seen one? The article also reports: *"As the shots reverberated, blood sprang from the President's face."* Hmm... By claiming blood sprang from Kennedy's face, and then indicating there was no wound apparent on the back of Kennedy's head, Bell and the AP had clearly suggested that the fatal bullet had entered from in front of Kennedy, and had failed to exit. Well, would they have done that if they were part of some grand conspiracy to hide that Kennedy had a large wound on the back of his head? I suspect not.

And then there's the driver. When testifying before the Warren Commission on 3-9-64 (2H112-132), **William Greer**, the driver of Kennedy's limousine, also claimed to have seen Kennedy's head wound upon arrival at the hospital. He even pointed out its location. Since this gesture would not show up on the record, however, counsel Arlen Specter asked *"Indicating the top and right rear side of the head?"* To which Greer responded *"Yes, sir; it looked like that was all blown off."* They later discussed the wounds observed at the autopsy. There, Greer reiterated that the wound was on the *"upper right side"* of the head and that the skull in this location was *"completely gone."* The wound proposed by many if not most conspiracy theorists is, of course, not even partially on the upper right side of the head, but entirely on the far back of the head below the top of the ear.

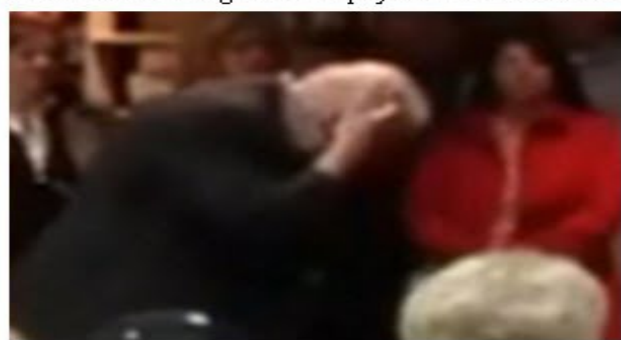

There is still another witness confirming the impressions of Jacks, Yarborough, and Greer. As we've seen, the 11-22-63 diary entry of motorcycle officer Douglas Jackson reflects that he saw Kennedy hit in the head above the right ear. Well, he also saw Kennedy's body as it was removed from the limo at Parkland Hospital. He wrote *"I got off my motor, stepped over to the presidential limousine. An agent opened the car door and started to get Mrs. Kennedy out but Mrs. Kennedy said no. It's no need she said and raised up from over Mr. Kennedy. I could see the **top** of his head was gone, his left eye was bulged out of socket. The agent said 'Oh no!' and started crying, pulled his coat off and placed it over Mr. Kennedy's head."*

Well, then, what gives? Didn't *any* of the closest witnesses to the shooting or Kennedy's body before it entered the hospital say *anything* suggesting they saw a large wound on the far back of Kennedy's head?

The Fog of War

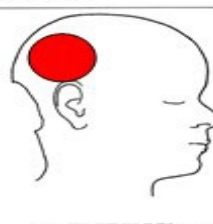

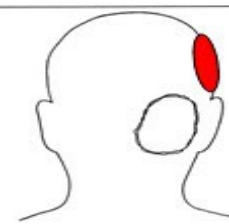

When asked about the head wound in a 12-3-10 appearance at Warwick's bookstore, moreover, he once again depicted it above the right ear (as seen below), and NOT on the far back of the head at the level of the right ear, where many conspiracy theorists--including Parkland physician Charles Crenshaw--have long placed the wound

At left: two stills taken from an 11-20-10 Book TV appearance by Clint Hill. While Hill's depiction of Kennedy's large head wound location varied slightly between his two attempts (performed approximately 30 seconds apart) he was consistent on one key point: the head wound was ABOVE Kennedy's right ear.

So WHY do some conspiracy theorists continue to claim Hill as a "back of the head" witness, whose statements are consistent with Dr. Crenshaw's? (The red ovals at right--representing Hill's recollections--have been added to a 1993 drawing depicting Crenshaw's recollections.)

Drawing found in Assassination Science, 1998.

The Fog of War

Yeah...one did... **Clint Hill**, the Secret Service agent riding to the hospital on the back of the limo, while making no initial comment on the impact location of the fatal bullet, would later describe the

appearance of Kennedy's head wound both en route to the hospital in Dallas, and then later, after the autopsy in Bethesda. An 11-30-63 report written by Hill relates: *"As I lay over the top of the back seat I noticed a portion of the President's head on the right rear side was missing and he was bleeding profusely. Part of his brain was gone. I saw a part of his skull with hair on it lying in the seat."* Hill returned to this later. When describing the aftermath to Kennedy's autopsy in his report, Hill relates *"At approximately 2:45 A.M., November 23, I was requested by ASAC to come to the morgue to once again view the body. When I arrived the autopsy had been completed and ASAC Kellerman, SA Greer, General McHugh and I viewed the wounds. I observed a wound about six inches down from the neckline on the back just to the right of the spinal column. I observed another wound on the right rear portion of the skull."* Well, this once again, is vague. A wound, whether on the "right rear side" of the head, or simply in "the right rear portion of the skull," could be most anywhere in back of the face, including the area above the ear.

So what about Hill's testimony, you might ask? Did he clear this matter up when testifying before the Warren Commission? Some would say so. In testimony taken nearly four months after the shooting, Hill told the Warren Commission: *"The right rear portion of his head was missing. It was lying in the rear seat of the car. His brain was exposed. There was blood and bits of brain all over the entire rear portion of the car. Mrs. Kennedy was completely covered with blood. There was so much blood you could not tell if there had been any other wound or not, except for the one large gaping wound in the right rear portion of the head."* Hill's testimony, then, first reflects that the wound was not on A portion of the right rear side, or merely ON a right rear portion of the skull, but instead covered THE entire right rear portion. It then reverses course, and reflects merely that it was IN the right rear portion, which could, of course, be anywhere in back of the face.

So, despite the widespread claims that Hill's testimony is proof the wound was on the back of Kennedy's head, it is, in reality, a confusing mess. With his statements and testimony, Hill had made four references to Kennedy's head wound--three that were unduly vague, and one that was overly expansive, as not even the looniest of conspiracy theorists believes the entire right rear portion of Kennedy's skull was missing. Perhaps Hill, then, when claiming *"THE right rear portion"* was missing, meant simply to repeat his earlier statement that *"A portion of the right rear side was missing,"* and mis-spoke. While this may be stretching, it explains Hill's subsequent claim, in a 2004 television interview, that, when he first looked down on the President, he saw *"the back of his head, And there was a gaping hole above his right ear about the size of my palm"* better than that he had forgotten what he had seen, or that he had suddenly, for the first time, more than forty years after his original testimony, decided to start lying about what he saw.

(In 2010, while promoting *The Kennedy Detail*, a book written by his fellow agent Jerry Blaine, Hill would repeat many more times that the wound was above Kennedy's right ear. Sometimes he would add-in that it was *"to the rear."* In the book, it said it was *"fist-sized."* Well, this was all some conspiracy theorists, including James Fetzer, needed. In January 2011 Fetzer started pretending that Hill's comments supported not only that the Zapruder film and autopsy photos are fake, but that Hill's description supported the wound as described and depicted by Dr. Charles Crenshaw in Fetzer's 1998 book *Assassination Science*. Apparently, it never registered with Fetzer that Hill had also pointed out exactly where he meant when he said the wound was above the ear to the rear, and that, as shown on the slide above, the location pointed out by Hill was much closer to the wound depicted in the autopsy photos than the wound on Crenshaw's drawings...)

"But the men behind Kennedy were all government employees!", some might claim. "What about the witnesses in back of Kennedy on the south side of the street? Certainly, they saw an explosion from the back of his head..." No, no such luck. There were three witnesses behind Kennedy on his left who would have been in a position to see an explosion from the back of his head, should a shot from the

grassy knoll truly have exploded from the back of his head, as so many believe. **Mary Moorman**, whose photo of Kennedy taken just after the shot's impact shows no evidence for such a wound, was interviewed numerous times on the day of the shooting, and would say only that she saw Kennedy grab his chest and slump down in the car. Her friend, **Jean Hill**, moreover, the woman in red in the Zapruder film, said much the same thing on the day of the shooting. Four months later, however, after much more spectacular reports had been printed, Hill claimed to have seen *"the hair on the back of President Kennedy's head fly up."* Note that she still was not claiming to have seen an explosion from the back of his head. No, she didn't even claim such a thing when tracked down and interviewed decades later by conspiracy writer Jim Marrs. Instead, she told Marrs simply that *"a bullet hit his head and took the top off."* "Top." Not "back." Ms. Hill, in fact, made no claims of seeing the explosion from the back of Kennedy's head so many conspiracy theorists assume she saw until her book *The Last Dissenting Witness* appeared in 1992. It related *"The whole back of his head appeared to explode and a cloud of blood-red mist filled the air."* That this was "poetic license" inserted by her co-writer, Bill Sloan, should be readily apparent. If not, one should take into account that by 1992 Ms. Hill was still so confused by what she saw that she told interviewer James Earl Jones and a national television audience that, as *"shots rang out"*, Kennedy *"grabbed his throat, and that was the horrible head shot."* Kennedy, of course, grabbed his throat long before the head shot.

Well, what of the third witness, then? Well, in his earliest interviews, **Charles Brehm** claimed to see Kennedy really get blasted and get knocked down in the car. No mention of an explosion from the back of his head. A few days later, however, newspaper accounts of the shooting quoting Brehm claimed he saw *"the President's hair fly up."* In 1966, when interviewed by Mark Lane, moreover, he filled in the details, and claimed *"When the second bullet hit, there was—the hair seemed to go flying. It was very definite then that he was struck in the head with the second bullet...I saw a piece fly over in the area of the curb...it seemed to have come left and back."* While some might wish to take the flight of this one piece of skull as an indication the fatal shot came from the front, they really shouldn't rush to such a judgment. You see, not only did Brehm long claim he thought the shots came from behind, but he paused before he told Lane *"the hair seemed to go flying."* During this pause, in an obvious indication of where he recalled seeing a wound, he motioned not to the back of his head but to...his right ear.

Well, were there any other known witnesses to the shooting to report on this wound? Yes. Railroad worker **James Simmons**, who'd watched the shooting from the railroad bridge on the west side of the plaza, testified during the the 1969 trial of Clay Shaw that it looked *"like the top of his head blew off and went up in the air."* Top. Well, then what about from further back? **Marilyn Willis**, standing quite some distance behind Kennedy, told the FBI in June, 64 that she saw the *"top"* of Kennedy's head blown off, only to turn around and tell a TV audience in 1988 that she saw brain matter blown out the *"back of his head,"* only to turn around yet again and tell Robert Groden in 1993 that the wound she saw was on *"this side,"* while grabbing the right side of her head above her ear.

But no matter how one takes her statements, one should recall that Mrs. Willis was about 50 yards behind Kennedy when he received his fatal bullet, and that should she have actually seen his head wound it was but for a second. This makes her seeing blood and brain blown out the back of his head, when no credible witness closer to him saw any such thing, quite unlikely. In fact, when one considers the numerous eyewitness statements claiming the bullet impacted on the right side or top of Kennedy's head, the Zapruder film's confirmation of a wound in this location, and the autopsy photos' additional confirmation of a wound in this location, one might rightly conclude that the only thing solid about the Kennedy assassination medical evidence is that there was a large wound above and in front of Kennedy's right ear.

But, should one think as one should, ironically, one would be wrong. The initial statements and reports of the doctors attending Kennedy at Parkland reflected an almost universal belief the large head wound

was rearward of Kennedy's right ear. In 1967, Josiah Thompson published his book *Six Seconds* in Dallas. This featured an artist's impression of Parkland doctor Robert McClelland's description of Kennedy's large head wound. As shown on the "Who to Believe?" slide above, the wound in this drawing was on the far back of the right side of Kennedy's head. Such a wound is, of course, thoroughly incompatible with the autopsy photos showing the back of Kennedy's head.

In 1979, the HSCA Authenticity Report attempted to smooth this over by declaring: "*In disagreement with the observations of the Parkland doctors are the 26 people present at the autopsy. All of those interviewed who attended the autopsy corroborated the general location of the wound as depicted in the photographs; none had differing accounts.*" But this declaration proved too little too late. David Lifton would shortly thereafter publish *Best Evidence*, a book holding that the descriptions of the Parkland witnesses differed from those of the Bethesda witnesses because the President's body had been altered while en route to the autopsy. Others, such as Harrison Livingstone and Robert Groden, (the latter of whom had worked as a photo analyst for the HSCA), then responded to Lifton's book with theories of their own. No, they claimed, in books showing the autopsy photos illicitly obtained by both Lifton and Groden, it's not that the body had been altered, a la Lifton, it's that the autopsy doctors had lied and that the back of the head photos had been faked.

Then thunder struck. In the late 1990's, after a number of new "back of the head" witnesses came forward, and a number of previously withheld HSCA interviews were ordered released by the ARRB, it was learned that many of these Bethesda witnesses had actually told the HSCA's investigators they'd seen a large wound on the back of Kennedy's head, and that a still unnamed person had *lied* about this in the HSCA Authenticity Report.

With that, all faith in the photographic evidence was shattered. Many, if not most, researchers, came to accept Groden's proposition that it was the photos that had been altered and not Kennedy's body. Some, however, came to reject Groden's proposition that the Zapruder film showed the occipital wound described by the Parkland witnesses, and embraced instead Lifton's suspicion that the Zapruder film--which had led many to suspect a conspiracy in the first place--had in fact been altered to, among other things, move the hole on the back of JFK's head to a more acceptable location in front of his right ear.

This led still others, such as ARRB analyst Doug Horne, to come up with their own unique hybrid theories. In his 5 volume work, *Inside the ARRB*, Horne explains that, in his view, the body, autopsy photos, x-rays, and Zapruder film were all altered in one way or another. He explains, furthermore, that the body alteration Lifton believed was performed BEFORE the body arrived at Bethesda was in fact performed at Bethesda by Dr. Humes, and that the Bethesda witnesses seeing a large wound primarily on the back of JFK's head saw this wound BEFORE Dr. Humes had altered the wound, and expanded it to include the wound on the top of Kennedy's head more consistent with an assassin's having shot him from behind. In still further opposition to Lifton, Horne holds that the wound on the back of the head was not reconstructed for the autopsy photographs. In opposition to Groden, however, Horne holds that the back of the head autopsy photos were not actually altered, but taken after the FBI had left, with the scalp stretched to hide the true dimensions of the hole. He holds, furthermore, that the x-rays were altered to hide this same hole.

So, in Horne's theory, the autopsy physicians were not deceived, as in Lifton's theory, but were instead prime deceivers.

Fetzer's Folly

Now, to give Horne credit, he developed his theory, and published his books, and then stepped back and let others figure out whether he was right or not. This left it to his #1 cheerleader, Dr. James Fetzer, to push his theory online, and bully his fellow conspiracy theorists into seeing the one true light. Well, Fetzer, no surprise, added some of his own bits to Horne's theory, and began pushing that those altering the Zapruder film screwed up and failed to remove the purported blow-out wound on the back of Kennedy's head from frame 374 of the Zapruder film. Fetzer held, furthermore, that the "cashew-nut-like shape" apparent on this frame "corresponds very closely to "Area P" (for "patched") in Mantik's analysis." Area P is, of course, the "white patch" identified by Dr. Mantik on the x-rays.

Well, as shown above, this is total nonsense. The "white patch" (which is really the wing of bone shown on the autopsy photos) and "cashew nut-like shape" (which is presumably the reflection of the sun on Kennedy's hair) are in fact inches apart. Now, I'm tempted to make a joke about this--something like "Fetzer's clearly nuts when he talks about the cashew nut-like shape," or "Fetzer's got nuts not only on his brain, but Kennedy's"-- but such a joke would be in poor taste.

Wouldn't it?

Views on the Views

Above: JFK's arrival in Texas. Note how the hair on the back of his head is easily displaced by wind.

Above: a crop from Zapruder frame 337, showing the defect above JFK's ear shown in the autopsy photos, as well as a "volcano-shape" on the back of his head.

View 2: photos 5-6, 26-28

While many conspiracy theorists think autopsy photo views 4 and 6 have been altered to hide a wound on the back of JFK's head, and that this wound is shown in Zapruder frame 337, others think the Zapruder film shows no such thing, and has also been faked. I suspect, however, that both sides are wrong, and that the so-called "volcano-shape" in frame 337 is just JFK's hair.

Views on the Views

And yet, in light of the fact that none of the closest witnesses saw an explosion from the back of Kennedy's head, Horne's and Fetzer's belief the autopsy team conspired to hide such a wound is indeed a bit nutty. (Sorry, Doug.) If the Newmans, Burkley, Zapruder, Sitzman, Hill, et al were all lying about what they saw on November 22nd, they wouldn't have described the wound near the right ear as an entrance, now would have they? They saw one large wound and assumed it to be an entrance. Later, Dr.

Humes found a small entrance on the back of Kennedy's head and decided the large head wound was an exit. It was logical, and almost correct. What isn't logical is to accept that the body was changed between Dallas and Bethesda, or that the statements of the Parkland witnesses prove the autopsy photos a fraud. To trust the words of so many at Parkland Hospital that the only large head wound was on the far back of Kennedy's head, after all, would mean (if one is to be consistent and trust the earliest witnesses, e.g. Newman and Zapruder) that the wound was first altered en route to the hospital, only to be changed back a few hours later on Air Force One en route to Washington.

Bunkum. Let's remember the words of Mrs. Kennedy. While many have used her statement *"from the front there was nothing"* as evidence the bullet erupted from the back of her husband's skull, they largely ignore the context of her statements. When describing the fatal shot, she told the Warren Commission *"just as I turned to look at him, I could see a piece of his skull, sort of wedge-shaped like that, and I remember it was flesh colored."* (The words "sort of wedge-shaped like that" were in the court reporter's transcript but never published. They are presumably a reference to the bone flap visible in the right lateral autopsy photos.) She then described cradling her husband in her arms, and getting a closer look at the wound. She said: *"from the front there was nothing. I suppose there must have been. But from the back you could see, you know, you were trying to hold his hair on, and his skull on."* Her words do not describe the wound's exact location, and suggest merely that the gaping wound on President Kennedy's head did not extend as far as his face. They do not detail an exit on the back of his head, as mistakenly purported by Dr. James Fetzer in his January 12, 2010 radio interview of Doug Horne, in which he claimed she had testified that *"she had a terrible time holding the back of his head and skull together,"* an assertion, by the way, to which Horne readily agreed. Still, one might wonder about the exact location of this wound.

Fortunately, only a week after the assassination, in a conversation with historian Theodore White, Mrs. Kennedy was far more descriptive. According to White's notes, released to the public in May 1995 and subsequently published in the September 1995 Kennedy Assassination Chronicles, she said: *"I could see a piece of his skull coming off...this perfectly clean piece detaching itself from his head; then he slumped in my lap."* Now, this would seem to be a reference to the detachment of skull seen in frame 314 of the Zapruder film, and can be taken as an indication of the film's legitimacy.

But that's not all she had to say. According to White's notes, she also said: *"All the ride to the hospital, I kept bending over him saying, 'Jack, Jack, can you hear me, I love you, Jack.' I kept holding the top of his head down trying to keep the..."* White's notes then detail that when discussing her husband's condition at the hospital, Mrs. Kennedy said *"From here down"*--and here she made a gesture indicating her husband's forehead--*"his head was so beautiful. I'd tried to hold the top of his head down, maybe I could keep it in...I knew he was dead."* Thus, according to White, she said the wound was at the "top" of her husband's head--not once but twice...

And that wasn't the last time she described the wound in such a manner. In her interview with White Mrs. Kennedy worried that the history of her husband's Presidency would be written by the likes of AP correspondent *"Merriman Smith, that bitter man,"* who, irony of all ironies, would soon thereafter win a Pulitzer Prize for his reporting on the assassination. This no doubt contributed to her subsequent decision to hire an historian of her own, William Manchester, to write an authorized book on the assassination. She was interviewed by Manchester on 4-7-64, 5-4-64, 5-7-64, 5-8-64, and 7-20-64. While Manchester's notes on these interviews have never been released, it's clear she told him, as White, that the fatal wound was at the top of Kennedy's head. In late 1966, she had a falling out with Manchester over his use of these interviews. His book could not be released without her approval. This, then, led to her reading a draft of his book, *The Death of a President*, and giving it her personal approval. Here is how the final draft described her husband's death: *"The First Lady, in her last act as First Lady, leaned solicitously toward the President. His face was quizzical. She had seen that*

expression so often, when he was puzzling over a difficult press conference question. Now, in a gesture of infinite grace, he raised his right hand, as though to brush back his tousled chestnut hair. But the motion faltered. The hand fell back empty. He had been reaching for the top of his head. But it wasn't there any more."

Now this can't be any more clear. Mrs. Kennedy had told Manchester that the fatal wound she saw was at the top of her husband's head.

That the descriptions of Kennedy's head wound by the First Lady and the earliest descriptions of the wound and/or impact location by Newman and Zapruder and so many others match the wound seen in the Zapruder film, autopsy photos, and X-rays leads me to suspect that the large head wound observed at Parkland was on the top of Kennedy's skull in front of his ear, and not on the back of his head as suggested by the Parkland witnesses.

We get letters...

Here are two responses to my mere suggestion that the Parkland witnesses could be wrong...and that the autopsy photos and x-rays of Kennedy are unaltered...

From a January 16, 2006 e-mail from David Lifton:

Pat,

A professor friend of mine attended this past year's Lancer conference and was highly critical of your presentation. He was incredulous that people would pay money to fly to Dallas and stay in a hotel—being there because they wanted information about the conspiracy that took JFK's life--and then be presented with a lecturer who tells them that the body had not been altered, when, in this case, the alteration of the body is the key to the case. I had never heard of you before, but followed a link he sent. Either in your presentation or at your website, you stated something to the effect that "I think too much is made of the Dallas doctors' observations."... From my brief reading of your material, your entire analysis is based on these wrong-headed and mistaken notions; e.g., the notion that the Dallas observations can be dismissed. In addition, there are any number of other mis-statements that are made and follow from that false premise, or foundation. Of course, it's a free country and anyone is free to assert whatever they wish about anything... My history professor friend was astounded that Lancer would present this sort of thing as a "serious" analysis of the medical evidence. I'm sure you won't be happy with these comments, but that's my opinion.

You say your background is in music. Were you to attend law school, and take a course in evidence, you would immediately see that you cannot approach the medical data as you do--you might still not agree with my analysis, but I don't think you would ever publicly present this sort of reasoning as the basis for a medical analysis in this case. In fact, contrary to your assertions, the primacy and importance of the Dallas doctors observations cannot be overemphasized.

DSL

From an online discussion on The Education Forum:

QUOTE(James H. Fetzer @ Jan 17 2006, 04:19 AM)

I had heard you were arrogant but hadn't noticed myself until now. You are suggesting that you have the competence and the expertise to interpret X-rays; in particular, that your competence and expertise is even greater than that of David W. Mantik, M.D., Ph.D.? I am astounded. Let me ask: How many trips into the National Archives have you made? How extensively have you tested the "original" X-rays using optical densitometry? Have you ever even studied David's chapters on the X-rays in ASSASSINATION SCIENCE? And is your vast competence supposed to extend to issues of alteration of

the Zapruder film as well? You must be some kind of mental giant! Why don't you explain to us how optical densitometry works and how David was able to ascertain empirically that the X-rays were altered? I would like to see a demonstration of your expertise. Believe it or not, I actually asked him to come to this forum and review claims that have been made about the X-rays. He has scanned many posts but has yet to find something that merits comment. So why don't you make a condensed case for your own views and I will share them with him, right after you show us the extent of your own competence to render these findings. Are you aware that David is Board Certified in Radiation Oncology? Are you Board Certified in Radiation Oncology? Frankly, I think all these issues are far beyond your competence, that you are completely out of your depth, but that some fantastic egoistic motivation drives you to pretend that you know things you don't and possess skills you never had. That is simply stupifying. And are you implying that you can understand the alteration issues with regard to the film WITHOUT studying Costella's work, which is visually displayed on my web site? You are truly an amazing guy! You appear to be ignorant of the most basic issues.

From reading the comments of Lifton and Fetzer, not to mention the 20 or so equally nasty emails and comments I've received in the years since for--gasp--daring to suspect that the observations of some doctors who didn't even take notes could be wrong, and that the Zapruder film, autopsy photos, and x-rays could be legitimate, one might assume I've violated some unwritten code among conspiracy theorists.

And indeed I have. By proposing that one can't simply cherry-pick one group of witnesses and say they are right, while ignoring both the first witnesses (the Dealey Plaza witnesses, the Zapruder film) and the best witnesses (the autopsy doctors, the autopsy report, autopsy photographs, and x-rays), I have shat upon the altar before which many conspiracy theorists genuflect. To conspiracy theorists of a particular bent, this is every bit as sacrilegious as my suggestion Dale Myers' animation is a fraud is to single-assassin theorists.

I mean, let's be consistent. If there is an incident--let's say a fatal car accident--in which both the statements of those witnessing the event and the statements of the tow truck drivers removing the wreckage confirm that the event occurred at the location depicted in the police photographs, you assume the location in the photographs to have been correct, even if the paramedics and first police responders, when asked about it later, some many years later, recall the accident as happening half way down the block.

So how is this any different?

Well, according to David Lifton, it's very different...

From a 1-27-11 post on the Education Forum (The atypical mis-spellings on this message are Lifton's, and are preserved for the sake of accuracy. Apparently he was falling asleep or in a hurry...or in a hurry to fall asleep.)

Pat: I do not have time to examine and critically analyze the full "chapter sized" postings you made, but just consider what you have written above. It is, in my opinion, easily refutable. Turn to Chapter 13 of BEST EVIDENCE, and just consider my December, 1966 interview with Dr. Paul Peters. "Dr. Peters emphasized that the head wound was at the back, that it was actually necessary to get to the back of the head to get a good view of it." Then, some pages later, and in the section under the breaker "What was visible through the wound," I dealt with all the testimony about the cerebellum, and here's what Dr. Peters had to say on that point, and I QUOTE:

"Dr. Peters gave me a most vivid description. . . . trying to impress upon me the locaton of the wound he saw, Dr. Peters said: "I'd be willing to swear that the wound was in the occiput, you know. I could see the the occipital lobes clearly, AND SO I KNOW IT WAS THAT FAR BACK, ON THE SKULL. I

could look inside the skull, and I thought it looked like the cerebellum was injured, or missing, because the occipital lobes seemed to rest almost on the foramen magnum. . . [it] looked like the occipital lobes were resting on the foramen magnum." (For readers of this thread who may not be all that familiar with anatomic terminology, the "foramen magnum" is the hole in the base of the skull, in that part of the occipital bone that wraps around and forms the base of the skull, through which the spinal cord enters and then connects to the brain.). It was as if something underneath them, [something] that usually kept them up from that a little ways, namely, the cerebellum and brainstem, might have been injured or missing." There can be no doubt about what part of the head Dr. Peters looked at, or how far down the back of the head the fatal wound he saw was located. Dr. Peters statement that he saw the occipital lobes resting on the foramen magnum was not the description of a casual observer."

Dr. Peters corroborated five Dallas doctors' testimony in the Warren Commission records that cerebellar tissue was visible in the skull wound. These observations clearly indicated where the Dallas wound was located.

UNQUOTE

Pat: I do not understand how, with such vivid testimony spelled out in plain English, you can possibly deny the clear evidence of where the head wound was located--at the bottom of the back of the head. And then join that mis-conception, or misunderstanding (or mistake--however one wishes to characterize the manner of your analysis) --and then join that to the controversy re the Harper fragment, and state: " [it] is the height of hypocrisy to turn around and claim the Harper fragment was occipital bone. For the Harper fragment to be occipital bone, there would have to have been a hole LOW on the back of JFK's head. NONE of the eyewitnesses to the shooting saw a hole there. . "

(Of course, do keep in mind that Dr. Jack Harper, who actually examined the bone, said it was occipital bone--and said so (as I recollect) on November 25, 1963, per the FBI interview.) The problem with your analysis--and I now remember that I ran into this when I first emailed with you years ago--was your statement that you thought that entirely too much weight was given to the Parkland records, or some such thing. Immediately I understood then--and from your postings here I see that things have not changed all that much in the years since--that you simply do not understand or appreciate the legal and historical importance of statements made AT THE TIME (first of all); and secondly, you continually will equate, in importance, "the Parkland witnesses" with "the eyewitnesses to the shooting."

There is no comparison between an "eyewitness to the shooting"--who may have had a fleeting glimpse of the President (and his wounding), a glimpse lasting a few seconds, and the observations of someone like Dr. Peters, who was in the Emergency Room, and had a chance to observe the wounds at close hand (just inches away), and with the experience of a trained physician.

Yet you continually invoke the "Dealey Plaza witnesses to the shooting" as if their observations should (or do) carry the legal weight comparable to those of the doctors and nurses in the Emergency Room. That's just plain wrong. Its apples and oranges. You should not be doing that, yet you continually do so.

The proper and legitimate comparison should be between observations made in the Parkland Emergency Room (or even in the Parkland Hospital parking lot, if someone got a good look at JFK's wounds there) and the reports from Bethesda. That is reasonable and legitimate. But to start by creating (and then invoking, as you do) a data base consisting of "eyewitnesses-to-the-shooting"

observations, and comparing them to those of the doctors actually in the emergency room, is not just of dubious value; its completely wrong, and represents a very serious analytic error. No wonder your conclusions are so completely off the mark, if they are based on "reasoning" like that. I appreciate all the pretty graphics (obviously, you are talented in that regard) but its the reasoning that counts, and I find this kind of reasoning deeply flawed.

When I have more time, I'll try to critique the lengthy posting you have made (and addressed to me), but again and again, I find you traveling down this same false path, mixing apples and oranges, and drawing all kinds of unjustifiable inferences, based on this flawed methodology. That pervades your entire analysis of the medical evidence, and results in a mistaken view of what the President's body actually looked like, after the shooting; what wounds it contained; a flawed view of Dealey Plaza, and--perhaps most important of all--an inability to discern whether "the medical evidence" has been altered.

And that is really the key: because if your methodology is so flawed as to not be able to perceive the evidence that the wounds on the body were altered between Parkland and Bethesda, then you have lost sight of THE major issue in this case.

DSL

1/27/11; 11:50 AM PST

Los Angeles, CA

PS: Also remember what Dr. Charles Baxter (I think it was he) who said that the President's brain was "lying on the table." What veteran JFK researcher Wallace Milam concluded--decades ago (and I agreed with him)--was that this was Baxter's less than optimal way of describing the brain at the back of JFK's head (when JFK was lying face up) protruding through the wound, and touching the surface of the hospital cart. Again, more evidence as to the rearward location of the wound.

I share Lifton's posting in total so the reader can see what I'm up against. In five years, I've made absolutely no head-way with him. He still claims the recollections of the Parkland witnesses are consistent and of prime importance and pretty much all that matters. He now adds, however, that the recollections of the eyewitnesses to the shooting--who, from Lifton's perspective, uniformly noted a wound on the right side of Kennedy's head before it even existed--are of no importance and can be dismissed with the wave of a hand.

Well, this is pretty silly, wouldn't you say? The recollections of a patient's wounds made by emergency room personnel days, months, and even decades after observing the patient are of infinitely more value than the descriptions of the patient's wounds given by eyewitnesses to his shooting only minutes or hours afterward? Says who? Pathologists are the doctors normally used in a court of law to establish the extent and location of a wound, not emergency room doctors and nurses, most of whose job it is to react, and not inspect...and who don't even take notes.

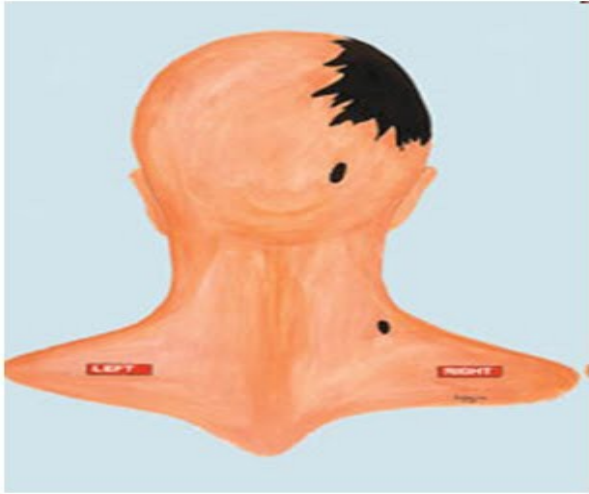

Now, IF the Parkland witnesses all claimed to get a good look at the wound, and all claimed to see a wound in the same location, and had all been willing to swear on a stack of Bibles that their recollections were correct and that the autopsy photographs were fake, I'd be tempted to change my mind.

But they didn't. And those telling you they did are as mistaken as those calling the single-bullet theory a "fact."

But I can't expect you to trust me on this. Not after mountains of malarkey have been dumped upon our heads for forty years...

So let's go through the statements of some of those considered key "back of the head" witnesses. Starting with Dr. Boswell...

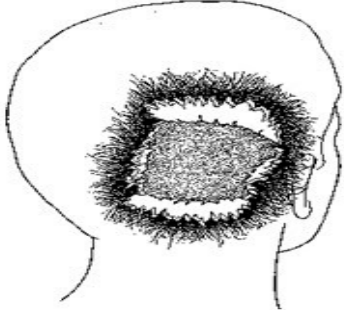

Boswell and Johnson

Above: Warren Commission Exhibit CE 386, a drawing created By Skip Rydberg in 1964 under the guidance of Dr. Boswell, depicting the small entrance and large exit on the back of Kennedy's head as seen at autopsy.

Above: a skull marked by Dr. Boswell for the ARRB in 1996. The outside lines depict the margins of the skull defect he saw when the scalp was peeled back. The middle line depicts a supposed scalp laceration. (Photo courtesy John Hunt.)

Above: a drawing created by Phillip Johnson, in an attempt to depict Dr. McClelland's recollection of the large head wound observed at Parkland Hospital. Note the relationship of the hole to the ear.

While some have tried to spin Dr. Boswell's recollection of the head wounds as told the ARRB as support for the back of the head wound recalled by Dr. McClelland, their recollections are at odds. Boswell saw a hole above the ear and a vertical laceration on the back of the head. McClelland noted neither of these, and instead saw a large hole where Boswell saw intact scalp and a small entrance on the bone.

Boswell and Johnson

Now, to be clear, Lifton never claimed Boswell as a "back of the head" witness...

Lifton holds, to this day, that the hole on the back of Kennedy's head observed at Parkland had somehow been repaired by the time Dr. Boswell saw his head at Bethesda, and that a wound in front of Kennedy's ear had been added.

In postings found online, in fact, he's made it more than clear he has little respect for researchers, such as Robert Groden and Dr. Gary Aguilar, who cite a number of Bethesda "back of the head" witnesses as evidence the wounds were unaltered between Parkland and Bethesda.

And he actually has good reason to be angry. As we shall see, the descriptions of the Parkland "back of the head" witnesses differ from those of the Bethesda "back of the head" witnesses on a number of key points.

But that's getting ahead of ourselves... For now, we need only realize that the use of Dr. Boswell as a "back of the head" witness is a bit bizarre on its face, seeing as he signed off on the autopsy report in which no scalp lacerations on the back of the head were noted, and seeing as he never ever said anything indicating he'd seen an entrance wound on the front of the head.

But when one looks at his statements to the ARRB--the statements usually quoted by those claiming him as a "back of the head" witness--it becomes even more bizarre.

Here is one of the key statements used by back-of-the-head wound theorists to sell Boswell as a "back of the head" witness:

BOSWELL: There was a big wound sort of transverse up like this from left posterior to right anterior. The scalp was separated, but it was folded over, and you could fold the scalp over and almost hide the

wound. When you lifted the scalp up, you could really lay it back posteriorally, and there was a lot of bone still attached to the scalp but detached from the remainder of the skull. And I think these parts back here probably reflect that.

And here is Boswell's response to a follow-up question by Jeremy Gunn:

GUNN: When you say the left posterior, what do you mean?

BOSWELL: The left occipital area, and that wound extends to the right frontal area. And what I meant was that the wound in the scalp could be closed from side to side so that it didn't appear that there was any scalp actually--scalp missing.

Yep. That's right. Those pushing Boswell as a witness for the wound described by the Parkland witnesses--a gaping EXIT wound of both scalp and skull on the RIGHT back of the head--are using Boswell's recollection of a scalp LACERATION on the LEFT side of the head, (a scalp laceration that could be closed from side to side so that one could not tell any scalp was missing, mind you), as evidence.

Now, even if one were to accept the ridiculous notion that his statements support there was a gaping wound missing both scalp and skull on the right back side of the head, how reliable are Boswell's recollections?

Not remotely, as it turns out.

More from his ARRB deposition with Gunn:

GUNN: Do you recall whether there were tears or lacerations in the scalp?

BOSWELL: Right across here and--

GUNN: Approximately across the midline?

BOSWELL: What I previously described, post-occipital, and on the left, across the top, and then down to the right frontal area, and then the laceration extended into the right eye.

GUNN: Okay. Could you make another drawing--and we'll put Line No. 2 on this--to show the approximate direction of the large laceration that you just referred to?

BOSWELL: Well, it's not a--I can't say what direction, but--and then this came on down like so, and--actually, I think it came right into here.

GUNN: Okay. I'm going to put a 2 in a circle right next to that line, and the 2 will signify the approximate direction and shape of the large laceration. Would that be fair?

BOSWELL: Mm-hmm.

GUNN: Just so I'm clear--and we'll be looking at the photographs in a few minutes, and you can maybe clarify it there. But at least with some of the photographs, is it your testimony that the scalp was pulled in a way different from how it was when you first saw it in order to better illustrate either wound of entry or exit?

BOSWELL: Yes. The scalp was essentially loose. In the usual autopsy, you have to cut underneath the scalp in order to reflect it. In this case, the scalp was mobile so that you could pull it forward to obscure the wound or pull it back to make the wound completely lucid.

GUNN: Okay. Was the hair cleaned in any way for purposes of the photographs?

BOSWELL: No, I don't think so. There was not a lot of blood, as I remember, and I think he had been pretty well cleaned up in the operating--in the emergency room. And I don't think we had to do much in the way of cleansing before we took photographs.

Well, wait right there. Boswell spoke to the ARRB in 1996. When asked the preceding questions by Jeremy Gunn he had not been shown the autopsy photos since 1977, and had not been shown the establishing shots taken at the autopsy--the photos showing Kennedy lying on the table before an inspection of his wounds had begun--since 1967. Clearly, he had forgotten that these first shots show

the President's hair to be matted with blood and brain. His response then shows that he lacked a clear recollection of Kennedy's original appearance when interviewed by the ARRB. He was in his seventies, after all, discussing something he'd seen more than 30 years before. So why should we believe his latter-day recollections are accurate?

We shouldn't. The scalp laceration stretching to the left occipital region suddenly recalled by Boswell 33 years after performing the autopsy was not only not mentioned in the autopsy protocol, it was specifically ruled out by Boswell in his 9-16-77 interview with the HSCA pathology panel.

When asked about the red spot the HSCA panel presumed to be the bullet entrance, and which Dr. Humes presumed was dried blood, Boswell replied:

"It's the posterior-inferior margin of the lacerated scalp." When one of the HSCA panel, Dr. Petty, expressed doubt about this, Boswell then repeated: "It tore right down to that point. And then we just folded that back and this back and an anterior flap forward and this exposed almost the entire--I guess we did have to dissect a little bit to get to."

If, in Boswell's mind, the scalp laceration ended at the red spot, high on the back of the head on the parietal bone, in 1977, there was no way it could possibly have stretched all the way to the occipital bone 19 years later. It seems clear, then, that Dr. Boswell was seriously confused.

But those pushing Boswell as a back of the head witness will never admit this.

Let's take, for example, Doug Horne. Horne had fed Gunn questions during the ARRB's questioning of Boswell. On page 111 of his opus, *Inside the ARRB*, Horne, who by his own admission had pursued a job with the ARRB in hopes of proving fraud in the medical evidence, quotes Boswell's response after being asked if his 17 by 10 measurement for the large skull defect reflected missing bone or fractured skull. Boswell responded: *"Most of that space, the bone was missing. There were a lot of small skull fragments attached to the scalp as it was reflected, but most of that space, the bone was missing, some of which--I think two of which we subsequently retrieved."*

Now look what Horne writes but four pages later, when discussing Dr. Boswell's approximation of the borders of this defect on a skull model: *"The 3-D skull drawing by Boswell was critical, because his autopsy sketch of the top of the skull had by its very nature not shown the condition of the rear of the head. Boswell's 3-D skull diagram completed the rest of the picture. And he wasn't depicting fragmentation or areas of broken bone, he was depicting areas of the skull denuded of bone. It was electrifying."*

What? Where does Horne get that Boswell wasn't depicting fragmentation? Boswell had just told him that part of the area depicted was where small skull fragments remained attached to the scalp. He had previously told him that upon the reflection of the scalp *"there was a lot of bone still attached to the scalp but detached from the remainder of the skull."* He had told writer Harrison Livingstone on 9-1-91, furthermore, that *"a pretty good size piece of the frontal and right occipital portion of the skull had separated and were stuck to the under-surface of the scalp. So when that was reflected, then it was true; there was a big bony defect in the right side of the skull."* Why does Horne ignore this?

Here's why:

GUNN: Just one last point that I would like to just clarify in my one mind is: On the piece for the markings for the 10 by 17 centimeters that were missing, would it be fair to say that when you first examined the body prior to any arrival of fragments from Dallas, the skull was missing from approximately those dimensions of 10 by 17?

BOSWELL: Yes.

Well, the word "approximately" is, in this instance, tragically vague. It allowed Horne to presume the back of Kennedy's skull was missing--as in gone--when the bulk of Boswell's statements over the years make clear it was badly fragmented and attached to the underside of the scalp. It bears repeating that NONE of the other back of the head witnesses described so much skull missing. Clearly Boswell had no idea how big the hole on the skull was before the scalp was peeled back. Clearly he measured the skull defect after the scalp had been pulled back and skull had fallen to the table. Clearly, the best indicator of the size of the hole on the back of the head, then, would be the x-rays, which fail to depict a large hole on the back of the head where Horne and others presume there was a hole...where the Parkland witnesses told them there was a hole...

But, wait, some of those believing Boswell to be a back of the head witness have found a novel way to undermine the credibility of the x-rays...provided, not surprisingly, by Gunn's questioning of Boswell:

GUNN: Were any skull fragments put back into place before photographs or before X-rays?

BOSWELL: I think before we took the--the ones that came from Dallas were never put back in except to try and approximate them to the ones that were present. But I think all the others were left intact.

GUNN: So, for example, was there a fragment that had fallen out at any point that you then put back into its place before a photograph or X-ray was taken?

BOSWELL: Yes.

GUNN: What size fragments and where did you place them at the--

BOSWELL: Well, the one that's in the diagram on Exhibit 1, that 10-centimeter piece I'm sure was out at one time or another. And I think maybe some of these smaller fragments down at the base of that diagram also were out at one time or another. But those were all put back.

So, from leading the clearly elderly and confused Boswell through a series of strange questions designed to support or refute the body alteration theory of David Lifton, Gunn got Horne the answer some conspiracy theorists were looking for...that bone was put back in the skull BEFORE an x-ray or photograph was taken. Never mind that Boswell at first specified that the large pieces of missing bone were not put back in the skull, and only said so after being asked the same question a second time. Never mind that the bone Boswell thinks they are talking about did not arrive until near the end of the autopsy, and that NOT ONE witness to the autopsy--let alone, x-ray tech or radiologist--recalled a skull x-ray being taken after the beginning of the autopsy.

And never mind that Horne himself dismisses this possibility... That's right, in Volume 2 of his 5 volume opus Inside the ARRB, Horne concludes that by the time the skull was reconstructed, the only men able to operate the portable x-ray machine had been sent home, and that no x-rays were taken during or after the re-construction of Kennedy's skull.

Even worse for those trying to twist Boswell's ARRB testimony into something it was not...Horne also concludes the skull x-rays were taken as a series at the beginning of the autopsy.

And it's no wonder. In The Assassinations, an anthology published in 2003, Dr. Cyril Wecht and Dr. David Mantik jointly confirmed that the brain, although badly damaged, is nevertheless apparent on the x-rays. This means the x-rays were taken at the beginning of the autopsy, not the end.

Dr. Mantik, to whom many, including Doug Horne, defer on all matters x-ray, has also concluded in his many papers and articles that the bone at the back of JFK's head in his post-mortem x-rays is consistent with the bone at the back of his head in his pre-mortem x-rays.

As a result, one can not reasonably propose, a la some of the wilder conspiracy theorists, that Boswell's confused testimony suggests that the 10cm fragment recovered from the floor of the limousine was placed back into Kennedy's skull to hide a hole on the back of his head on the x-rays and autopsy photographs. The presumed hole was, after all, in the occipital region. The 10cm fragment was, on the

other hand, parietal bone (according to the HSCA Forensic Pathology Panel), or frontal bone (according to Dr.s Angel and Mantik).

So why play with Boswell's words to suggest such a thing?

Let's be clear. Mantik has concluded that the skull in the lateral x-ray is JFK's, but that a white patch has been super-imposed on the right side of the skull on the x-rays. Horne accepts this conclusion. Horne also accepts that the back of the head photos are unaltered, and that the hole he believes should be shown in the photos was obscured through some clever manipulation of the scalp by the autopsy doctors. Neither Mantik nor Horne, then, believe, nor indicate in any of their writings, that a hole on the back of the head was disguised through the insertion of a piece of recovered bone, nor that doing so would create the white patch apparent on the x-rays.

So why do some theorists, purportedly impressed with Mantik's research, Horne's analysis, and Wecht's credentials, suggest that the intact skull on the back of the head on the x-rays and back of the head photos reflects not that the back of the head was intact, or even made to look intact via manipulation of the scalp, but that the x-rays and back of the head photos were taken towards the end of the autopsy, after the recovered bone fragments provided by the Secret Service were stuffed back into the skull?

I mean, that's not only silly, it's in opposition to the findings of the most prominent members of the "hole-in-the-back-of-the-head" gang. It is, in other words, too silly for men not remotely scared of looking silly.

But there's a reason for this silliness. And that's that Boswell himself provided the fodder for this silliness. In his 1977 interview with the HSCA Forensic Pathology Panel, Dr. Boswell revealed that he now remembered the story told the Warren Commission of the doctors' pairing up the internal beveling on the small wound on the back of the head with the external beveling on the largest fragment found in the limousine to conclude the bullet traveled from back to front, as them matching up a beveled semi-circle of entrance on the largest fragment with beveling on the intact skull. While discussing the back of Kennedy's head and the bone fragments brought in during the autopsy, he said: *"this bone was all gone and actually the smaller fragment fit this piece down here--there was a hole here, only half of which was present in the bone that was intact. and this small piece then fit right on there and the beveling on those was on the interior surface."*

In 1994, when asked by Dr. Gary Aguilar if Rydberg drawing CE-388 shows the largest of the late-arriving fragments (the one with the beveling) placed back on the skull, moreover, he said: *"Yeah, the eh -- that fragment -- the defect -- the wound of entrance was at the base of that defect and, eh, the shelving on the inner surface of the bone was half on the intact portion of the skull and half on that fragment that we received from Dallas and replaced."*

Well, heck. Boswell had thereby confirmed that the source of much of his (and subsequently *our*) confusion: in his old age he'd come to believe the beveling on the largest fragment was entrance beveling--which was at odds with the autopsy report he swears by--and this, in turn, led him to think the largest fragment x-rayed at autopsy--which even CTs like Mantik agree derived from the front of the head--derived from the back of the head. There is no corresponding blow-out on the back of the head on the x-rays, of course. And this, in turn, led Boswell to muse that the x-rays were taken with the largest skull fragment flown in from Dallas placed back into the head.

By the end of his 1996 ARRB testimony, for that matter, Boswell had confirmed this explanation for his confusion.

GUNN: In your answer to a previous question, you made reference to the exit wound in the skull. Did you ever see any evidence of any beveling in the skull at the point where you determined there was an exit wound?

BOSWELL: At the time of autopsy we didn't. But then when we reviewed the photographs, some of that beveling in the skull is equivocal, and obviously we weren't able to tell.

GUNN: So would it be fair, then, to say that you determined during the course of the autopsy where the beveling was at the entrance wound, but you could not determine any beveling at the exit wound?

BOSWELL: That's true.

So there you have it. Over time, Boswell had come to remember the beveling discovered on the late-arriving fragment as entrance beveling, not exit beveling. And this was refuted by the autopsy protocol both signed by Boswell and upheld by Boswell as the only document related to the medical evidence worth spit.

If ONLY someone had stepped in and reminded Boswell that the beveling on this largest fragment was, according to both the autopsy report he swears by, and his colleagues, EXIT beveling, not entrance beveling, a lot of confusion could have been avoided. But, alas, most interviewers see their job as recording the recollections of aged observers, and not correcting them (or giving them the chance to correct themselves) when they've strayed far far from the well-worn path.

Still, Boswell is not the only purported back of the head witness whose muddy recollections have been further muddled up and then spun into conspiracy gold.

The Two Johns

He wasn't even the only member of the autopsy team to have his words cherry-picked in such a manner. On March 8, 1978, radiologist John Ebersole was interviewed by Gil Dulaney of the *Intelligencer Journal of Lancaster* (Pa.). He was quoted as saying *"It was the back of the head that was blown off."* And this wasn't a one-time slip-up. According to writer David Lifton, who was shown a transcript to this conversation by Dulaney, Ebersole further described the wound as *"a very obvious horrible gaping wound at the back of the head."* Well, that's all it took for some to claim Ebersole as a back of the head witness. Never mind that he, as Boswell, had signed off on the authenticity of the autopsy photos and x-rays in 1966. Never mind that the full context of Ebersole's statements to Dulaney ran counter to the narrative pushed by those claiming a bullet entered from the front and blew out the back of Kennedy's head. According to the March 9, 1978 AP article (found in the *Gadsden Times*) on Dulaney's interview of Ebersole, Ebersole claimed *"I would say unequivocally the bullet came from the side or back. The front of the body, except for a very slight bruise above the right eye on the forehead, was absolutely intact. It was the back of the head that was blown off. There is no way that I can see on the basis of the x-rays that the bullet came from anywhere in the 180-degree angle to the front, assuming Kennedy was facing forward. It looked to me like an almost right to left shot from the rear."* And never mind that Ebersole repeated these claims in his 3-11-78 testimony before the HSCA Forensic Pathology Panel. When discussing Kennedy's wounds on 11-22-63, he offered that *"The back of the head was missing..."* After being shown Kennedy's x-rays and asked if he could identify an entrance location for a bullet, however, he asserted: *"In my opinion it would have come from the side on the basis of the films. I guess that is all that can be said about the films at this time... I would say on the basis of those x rays and x rays only one might say one would have to estimate there that the wound of entrance was somewhere to the side or to the posterior quadrant."* When then shown an autopsy photo and asked if the head wound depicted correlated with his recollections, he answered *"You know, my recollection is more of a gaping occipital wound than this but I can certainly not state that this is (not) the way it looked. Again we are relying on a 15 year old recollection. But had you asked me without seeing these or seeing the pictures, you know, I would have put the gaping wound here rather than more forward."* When then shown another photo and asked to compare the location of the wound in the photo to his recollections, he replied that the wound in the photo was *"More lateral. Much more lateral and superior than I*

remembered."

Note that he was consistent in claiming there was no entrance wound on the front of the head. Note as well that he had said nothing about an entrance wound by the EOP. Ebersole had recalled one wound, and he had recalled it as residing further back on the head than it was shown to be on the x-rays and autopsy photos, to which he deferred.

An article in the 7-22-78 issue of *The Continuing Inquiry* provides further illumination. Built around an interview with Art Smith on 3-28-78, 3 weeks after Ebersole had spoken to Dulaney, the article relates that Ebersole was by then claiming that when he told Dulaney *"It was the back of the head that was blown off,"* he *"really meant the side of the head."* According to Smith, Dr. Ebersole stated further *"that the wound was located on the side of the head above the ear, approximately 2 x 3 inches in diameter"* and that *"no bone in the back of the skull was missing."* Of course, that wasn't good enough for all too many, including Smith. In his article, Smith sought to undermine Ebersole's credibility by writing that when he confronted Ebersole with his statements to Dulaney about the back of the head, that Ebersole claimed *"It was a misquote. I really meant side of the head."* Smith then claimed he'd called *"Delaney"* to see if he had misquoted Ebersole, and was assured by *"Delaney"* that the conversation had been taped, and that Ebersole had not been misquoted. Smith then argued that Ebersole, if he really thought he'd been misquoted, had had plentiful opportunity to complain to *"Delaney"* about the misquote prior to Smith's call, but had failed to do so.

This, however, was grossly unfair. Smith made a tape of his phone call to Ebersole, which he shared with writer David Lifton. This tape, as quoted in Lifton's book *Best Evidence*, shows that after Ebersole said he'd been misquoted about the back of the head, Smith asked *"That was a misquote?"* It shows further that Ebersole then replied *"Yes. Misquoted"* but then corrected himself and said *"I really, ah, I may have said that--what I meant was, the side."*

Ebersole had not denied that he'd told Dulaney the wound was on the back of the head. And Smith knew it before writing his article suggesting as much. Ebersole had said the word "back" instead of "side" before being shown the x-rays and autopsy photos he had long claimed to be authentic, and that was all it took for him to be forever painted as a "back of the head" witness, who'd tried to lie his way out of it.

Autopsy photographer John Stringer is yet another autopsy participant to wrongly be characterized as a "back of the head" witness. Stringer, along with Boswell, Ebersole, and Humes, signed the November 1, 1966 inventory of the autopsy photos and x-rays, in which these materials were claimed to be authentic. The final page of this inventory bearing their signatures claimed that it listed *"all the x-rays and photographs taken by us during the autopsy."* Although Stringer and the others have since indicated they weren't so sure about the word "all," they have never retreated from their claim the x-rays and photos they observed were ones they'd taken. It is almost certain, moreover, that these are the x-rays and photographs in the archives today. And yet, when testifying for the ARRB in 1996, Stringer failed to recognize the photos of Kennedy's brain as photos he'd taken at the supplementary examination of Kennedy's brain. He thought he would have done a better job identifying the photos themselves when taken; he thought he'd have used a different kind of film; and he didn't remember taking one of the views. Well, this, of course, is interesting.

But conspiracy theorists of all stripes have taken from this that the photos were switched out to hide a hole on the back of the brain, a hole proving once and for all that the shot killing Kennedy came from the front and blew out the back of his head. Many assert that this makes Stringer--yep, you guessed it--a "back of the head" witness...

And that's just nonsense. I mean, if the 78 year-old Stringer could tell by looking at the photos in 1996 that they were not taken by him, wouldn't he have been much better able to tell in 1966, just a few

years after their taking, when he was but 48? Well, then why didn't he say so, or remember his thinking so? In 1977, moreover, the HSCA asked the then 59 year-old Stringer to go to the archives and look at the autopsy photos. The report on his doing so reflects that, while he was uncertain he'd taken the black and white photos of the brain, the brain itself gave the appearance of the brain he'd photographed, and that the brain, as Kennedy's brain, was not sectioned (cut into quarters). While some, including Doug Horne and writer Jim DiEugenio, are fond of pointing out that Stringer told the ARRB that autopsy photographers who objected to things, such as rushing through the autopsy, didn't "last long," this by no means suggests he would have readily gone along with someone switching out his photos, as they so ardently believe.

Nor does it make much sense. By Horne's own admission, the 78 year-old Stringer's memory had by 1996 faded so badly that he couldn't even remember being contacted by the HSCA, let alone visiting the archives on their behalf. It follows then that the confusing aspects of his ARRB testimony may simply have been a reflection of his age, and the passing of time. It makes little sense, after all, to assume Stringer would readily admit what all too many now perceive as an important truth--that he did not take the brain photographs--but then lie about the nature of Kennedy's head wounds in order to "get along." What, are we to believe Stringer was so stupid he didn't realize his disowning the brain photos was bound to raise some questions?

And yes, you read that right. Those holding that Stringer was a bold and fearless truth-teller when discussing the brain photos inevitably hold he was a cowardly liar when discussing Kennedy's head wounds.

Consider... When first contacted by Doug Horne on behalf the ARRB, and asked to describe the large head wound, Stringer told Horne *"there was a fist-sized hole in the right side of his head above his ear...It was the size of your fist and it was entirely within the hair area. There was a sort of flap of skin there, and some of the underlying bone was gone."* When under oath in his ARRB testimony, moreover, Stringer further confirmed that, no matter who took the brain photos, there was NO large blow-out wound on the back of Kennedy's head. When asked to describe Kennedy's head wounds, he at first described a small wound on the occipital bone near the EOP, *"about the size of a bullet, from what you could see."* He then described the large head wound: *"Well, the side of the head, the bone was gone. But there was a flap, where you could lay it back. But the back - I mean, if you held it in, there was no vision. It was a complete head of hair. And on the front, there was nothing - the scalp. There was nothing in the eyes. You could have - Well, when they did the body, you wouldn't have known there was anything wrong."*

He was thereby describing the wound depicted in the autopsy photos and not the wound on the far back of the head proposed in books such as Horne's. Which only made sense... Stringer had, after all, signed an inventory in 1966 in which it was claimed the autopsy photos were those he'd taken, and had, upon studying these photos a second time in 1977, confirmed this by explaining to the HSCA's investigators what he was trying to portray as he took each shot. He had, moreover, told an interviewer from the Vero Beach Press-Journal in 1974 that the fatal bullet *"had entered the right lower rear"* of Kennedy's head and had come *"out in the hair in the upper right side, taking with it a large chunk of his skull."*

While Mr. Stringer had also intimated (in a 1972 phone call with David Lifton) that the *"main damage"* was on the *"back part"* of Kennedy's skull, it's not entirely clear that Stringer was describing the damage to the skull apparent before the reflection of the scalp, or after. It's fortunate then that Stringer got a chance to clarify this issue in his ARRB testimony. He explained that when he first saw the skull, the scalp at the back of the head *"was all intact. But then they peeled it back, and then you could see this part of the bone gone."*

Now, should one believe I'm cherry-picking here, and wrongly accepting Stringer's latter-day

recollections over his much earlier statements to Lifton, one should go back and read the transcript of Stringer's conversation with Lifton, as released by the ARRB. It's confusing to say the least. After Stringer told Lifton the wound was on the *"back part"* of the skull, Lifton sought further clarification. He asked *"In other words, there was no five-inch hole in the top of his head?"* To which Stringer replied *"Oh, it was...ahh some of it was blown off--yeah. I mean, ahh...towards out of the top, in the back, yeah."* Apparently unsatisfied with that answer, Lifton later returned to this question, and re-framed it in one of the most confusing series of questions I've ever read. He asked *"If you lie back in a bath tub, just in a totally prone position and your head rests against the bath tub, is that the part of the head, you know, is that the part of the head that was damaged?"* To which Stringer replied *"Yeah."* (Now, I'm already lost. If you're laying back in a bath tub, you're not really prone, are you? Does Stringer's response then indicate that the top of the head was damaged? Or the back of the head?) Lifton then sought further clarification--with an equally confusing question. He asked *"the part that would be against the tile of the bathtub?"* To which Stringer replied *"Mm-hmmm."* (I'm still lost. Isn't the *"tile of the bathtub"* normally the tile on the back wall of a bathtub? And, if so, doesn't Stringer's response suggest the top of the head was damaged, and not the back?) Lifton then tried again: *"Whereas the part that would be straight up ahead, vertically in that position--was undamaged?"* To which Stringer replied *"Oh, I wouldn't say--undamaged--no. There was---some of it was gone--I mean--out of some of the bone."* (Now, I'm not exactly sure what this means. But it seems clear, nevertheless, that Stringer thought he'd observed a hole on the top of Kennedy's head, where so many assume no hole was found. And that's not all that seems clear. In his book *Best Evidence*, Lifton re-writes this last question, and changes the context of Stringer's reply. He claims he asked Stringer *"about the part of the head which in that position would be straight up and down, the vertical part, the 'top.' Was that undamaged?"* His actual words, of course, were not so clear. According to his transcript, he not only failed to specify that he was talking about the top of the head, but said *"straight up ahead"* instead of *"straight up and down."* And that's confusing as heck. There is reason to believe then, that Stringer was confused by Lifton's questions, and just played along to get him off his back, not realizing his answers would be quoted in a best-selling book 8 years later, and cited as evidence for a massive conspiracy.)

And should one still have doubts Stringer failed to see a large hole on the back of Kennedy's head where conspiracy theorists believe it to have been, Stringer explained under further questioning by the ARRB that the occipital bone was *"intact"* but fractured, and that he could not recall any of it missing upon reflection of the scalp.

So, yes, it's clear. Those believing Stringer to be honest and credible when telling the ARRB he didn't take the brain photos, and then using this to suggest there was a blow-out wound to the back of Kennedy's head, are behaving like the Warren Commission in reverse: taking snippets of someone's testimony, propping these snippets up as proof of something, and then finding ways to hide or ignore that the bulk of the witness' statements suggest something other than what they are trying to prove.

Now, this is fairly common behavior, on all sides of the discussion. But what is unusual in this circumstance is the strength with which those pushing this view hold onto two mutually exclusive ideas: 1) Stringer is a brave truth teller, and PROOF the brain photos are not of Kennedy's brain, and 2) Stringer is a gutless liar, out to protect the status quo by pretending there was no hole on the back of Kennedy's head.

I trust I'm not alone in finding this a problem. As far as Doug Horne, not only does he push in his book that Stringer lied about Kennedy's head wounds to the ARRB, he asserts that Stringer first publicly reversed himself from the descriptions he'd provided Lifton (in the 1972 phone call) in 1993. This avoids that in the 1993 article cited by Horne, Stringer's 1974 comments, in which he'd accurately described the wounds depicted in the autopsy photos, were discussed, as well as the fact that a TV crew

inspired by Lifton's book interviewed Stringer in 1988, only to shelve the footage when Stringer told them the autopsy photos were accurate depictions of Kennedy's wounds. This, then, raises as many questions about Horne's integrity as Stringer's. That Stringer was describing the wounds shown in the autopsy photos as early as 1974, after all, cuts into Horne's position that Stringer reversed himself on the nature of these wounds as a response to Lifton's book, published seven years later, in 1981.

Of course, Stringer's not the only witness to be abused in such a manner.

Harper, Lee, and Tom Robinson

Above: ARRB MD 63

Since some, such as Josiah Thompson in 1967 (at left), and David Lifton in 1980 (at middle), had proposed that the Harper fragment was occipital bone, and that its absence was compatible with the wound seen at Parkland, it appears significant that Kennedy's mortician, Tom Robinson, told the HSCA in 1977 there was a hole in this location. (As shown at right, above.)

But things are not as they appear. Not only did Robinson's statements not support there was a bullet entrance on the front of Kennedy, and that Lee Harvey Oswald was innocent, as claimed by so many, his depiction of the head wound location on an anatomy drawing for the ARRB in 1996 (ARRB MD 88, at right) was in conflict with the location for the Harper fragment as proposed by Robert Groden in *The Killing of a President* (at left), and David Mantik in his presentations (at middle).

Harper, Lee, and Tom Robinson

Nor the most ridiculous. One of the strangest "back of the head" witnesses, in my opinion, is Tom Robinson, one of Kennedy's morticians. The stealth with which conspiracy theorists, in an attempt to acquit Lee Harvey Oswald, present Robinson's words to suggest Kennedy was shot from the front, is truly a wonder to behold.

This is how researcher Michael Griffith presents Robinson in his online essay *The Head Shot from the Front*.

Tom Robinson the mortician. He reassembled the President's skull after the autopsy. He reports that there was still a visible defect in the back of the head even after the inclusion of some late-arriving skull fragments from Dallas.

After discussing Dr. Burkley's claim the bullet entered Kennedy's temple, and pretending that Burkley's words suggest a separate exit on the back of the head, Griffith further discusses Robinson: *"This was very probably the same small temple-entry hole that was described by some of the Parkland doctors*

and that was filled with wax by Tom Robinson."

Well, this suggests that Robinson not only saw an exit on the back of the head and an entrance on the front, but that the Harper fragment--the only large bone fragment not recovered by the end of the autopsy--was occipital bone, correct?

Well, maybe, but what Griffith presents is not a fair presentation of Robinson's words.

When asked, on 1-12-77, by HSCA counsel Andy Purdy if he could tell what percentage of the large hole on the back of Kennedy's head he'd observed had been caused by bullets, as opposed to the doctors, he responded: *"Not really. Well, I guess I can because a good bit of the bone had been blown away. There was nothing there to piece together, so I would say probably about [the size of] a small orange."*

He is basing his guess, then, on the size of the hole left on the back of the head after reconstruction. He doesn't even realize that three large bone fragments had been retrieved and added back into the skull, and that the size of the hole after reconstruction does not reflect what he thinks it does...

He also offers no reason to believe the reconstruction was accurate. Morticians are not forensic anthropologists. They are not trained to piece shattered skulls back together. They are cosmeticians. They stretch and sew torn scalp together to hide head wounds. They use packing material and rubber to reconstruct skulls, not super glue. In this case, moreover, they were hired to make the body presentable at a State Funeral. So, OF COURSE the hole left over at the end of the initial phases of reconstruction -- which Robinson did not even perform, nor pay much attention to (he observed the autopsy from a location on the left side of the President's body and had no recollections of a large wound on the right top side of the President's head)--was on the back of the head (where it could be hidden in a pillow should the President have been given an open-casket funeral), and not the right top side of the head, from whence the Harper fragment almost certainly derived.

That the wound during the autopsy was not where Robinson saw it at the end of the autopsy is supported, moreover, by Robinson himself. Consider the summary of Robinson's interview with the ARRB, written by Doug Horne, which reveals: *"Robinson said he had a '50 yard line seat' at the autopsy...He said the President's head was to his right, which means that he was on the anatomical left of the president during the autopsy. He said that most of the pathologists and their assistants were opposite him, on the anatomical right of the president during the autopsy."* Well, why would the autopsy team be standing on the right side of the body, if the wound was at the middle of the back of the head?

But that's not the only reason to doubt the hole in the middle of the back of the head seen by Robinson was the exit wound seen at Parkland. For one, he said this hole on the skull was "circular." Well, who believes the triangular Harper fragment--as stated, the only large bone fragment still missing by the end of the autopsy--would leave a circular hole on the skull? No one. When asked by Doug Horne and the ARRB in 1996 to further describe this hole and mark the location of this hole on a drawing, moreover, Robinson contended that he believed this hole was an entrance wound, and placed it in the middle of the occipital bone, inches away from where conspiracy theorists Robert Groden and David Mantik hold the Harper fragment erupted.

The strangeness surrounding Robinson's testimony, or at least most theorists' interpretation of his testimony, however, is best illustrated through a discussion not of Robinson's ARRB testimony, but

Saundra Spencer's ARRB testimony. In Volume 2 of his 5 volume opus, Doug Horne writes: *"Before the photograph that Saundra Spencer developed was exposed, a head-filler...was used to restore shape and structure to the severely damaged cranium; after a 'rubber dam' was located to help seal the large cranial defect and prevent body fluids from leaking from the cranium inside the casket, the remaining scalp was stretched back into place as much as possible and sutured together (as well as into the rubber dam material) outside the now hardened and reconstructed skull. **The two-inch diameter 'wound' that Saundra Spencer recalls seeing squarely in the middle of the back of the head in one photograph, high in the occipital bone, simply represented the small area that the undertakers could not repair and close.**"*

Robinson's fellow mortician John Hoesen described a similar hole on the back of the head. According to Horne, Hoesen claimed *"it was roughly the size of a small orange...located in the center of the back of the head."* Horne then proceeds to assert that Hoesen, as Spencer, was describing the small hole remaining after skull reconstruction.

And yet he maintains that Robinson, who described a hole in the exact same location, in nearly identical terms, (it was the size of a "small orange") was describing the head wound at the beginning of the autopsy! What? Where does he get that?

He gets that from Robinson's HSCA and ARRB interviews, and his claim the head wound was enlarged by Dr. Humes to remove the brain (something Humes actually testified to). Apparently, Horne assumes Robinson's description of the wound prior to being enlarged was based upon an independent observation, and not on speculation derived from its appearance during reconstruction. Well, as we've seen, this just isn't true. When asked if he could estimate the size and location of the wound at the beginning of the autopsy, before the enlargement of the wound and removal of the brain, Robinson told the HSCA's Andy Purdy: *"Not really. Well, I guess I can because a good bit of the bone had been blown away. There was nothing there to piece together, so I would say probably about [the size of] a small orange."*

"Not really. Well, I guess I can because..." Horne's "Epiphany" that Robinson saw an orange-sized hole on the back of Kennedy's head, and that Dr. Humes then enlarged this wound to hide its real size (as opposed to simply pulling out the brain), is thus exposed as smoke. If the hole started out as orange-sized, and was then expanded for the taking of the autopsy photos, and then reconstructed with the addition of the three large skull fragments flown in from Dallas, how could it be orange-sized at the end?

No. Nothing strange there.

Well, then, what about the entrance on the front of the head observed by Robinson? Certainly, Robinson's recollection of THAT wound is important. Well, WHAT entrance on the front of the head? He saw no such thing.

Here is his discussion with Purdy of the wound he observed.

PURDY: Did you notice anything else unusual about the body which may not have been artificially caused, that is caused by something other than the autopsy?

ROBINSON: Probably, a little mark at the temples in the hairline. As I recall, it was so small it could be hidden by the hair. It didn't have to be covered with make-up. I thought it probably a piece of bone or a piece of the bullet that caused it.

PURDY: In other words, there was a little wound.

ROBINSON: Yes.

PURDY: Approximately where, which side of the forehead or part of the head was it on?

ROBINSON: I believe it was on the right side.

PURDY: On his right side?

ROBINSON: That's an anatomical right, yes.

PURDY: You say it was in the forehead region up near the hairline?

ROBINSON: Yes.

PURDY: Would you say it was closer to the top of the hair?

ROBINSON: Somewhere around the temples.

PURDY: Approximately what size?

ROBINSON: Very small, about a quarter of an inch.

PURDY: Quarter of an inch is all the damage. Had it been closed up by the doctors?

ROBINSON: No, he didn't have to close it. If anything, I just would have probably put a little wax in it.

When asked later what he thought caused this wound, moreover, he claimed *"I think either a piece of bone or a piece of the bullet. Or a very small piece of shrapnel."* When asked one last time what he thought caused the wound, furthermore, he reiterated *"A piece of the bone or metal exiting."*

So, Robinson did not call this wound an entrance, nor think it was an entrance. No, he believed it to have been an exit for a very small fragment of some sort, or perhaps even a mark created by shrapnel. This is NOT the description of an entrance hole for an explosive round so many pretend it is, nor a bullet hole of any kind.

Heck, it was a wound so small that Robinson wasn't even sure he put wax in it.

So why pretend otherwise?

I mean, Griffith, a fairly conservative researcher, has presented the exact same nonsense spewed by the far from conservative James Fetzer in his online posts, and has indicated that Robinson saw 1) an exit on the back of the head (when he in fact said he thought it was an entrance), and 2) an entrance on the front of the head (when he in fact said it was to his mind an exit for a small fragment, and possibly even a nick from shrapnel).

Unfortunately, this is not an isolated case. Robinson is far from the only "back of the head" witness whose stories fail to support what is claimed of them.

And he's not even close to the worst. No, the worst "back of the head" witness, beyond doubt, is Joe O'Donnell. Now, O'Donnell, a former photographer for the U.S. Information Agency, never claimed to see Kennedy's body. But, starting in the early nineties, he did claim that a friend, White House photographer Robert Knudsen, showed him autopsy photos of Kennedy within days of the shooting, and that these photos showed a large grapefruit-sized wound on the back of JFK's head and another much smaller wound in JFK's forehead above his right eye... Now that would have been the end of it--an old man telling tall tales. But the ARRB's Doug Horne, hearing of this story, helped arrange for an official interview of O'Donnell in 1997, and O'Donnell repeated his claims.

Horne found support for these claims, moreover, when the family of the no longer available Knudsen told him that yessirree, he'd claimed he'd taken photos of the autopsy. Horne even found an article on Knudsen from 1977 in which Knudsen claimed he'd taken photos of the autopsy. His claim was

dubious at best, however, as he claimed he was the *only* photographer at the autopsy--an assertion no one, including Horne, believes.

But that's as far as it goes. From there it dissolves into nothing.

You see, Knudsen was interviewed for the HSCA in 1978, well after the article in which he claimed he'd taken the autopsy photos had been published. He told the HSCA he'd helped DEVELOP the autopsy photos, and confirmed he'd not been present at the the autopsy itself by admitting he'd first became aware of the photos the morning after the autopsy. There is NO evidence he was at the autopsy. Not one person known to be present at the autopsy, including those suspecting a conspiracy, such as Paul O'Connor and Floyd Riebe, had any recollection of his being at the autopsy. Knudsen was a White House photographer--who took pictures of Mrs. Kennedy shaking hands and that sort of thing. He didn't belong at the autopsy and he clearly wasn't there.

Well, okay, then perhaps he showed the photos he'd *developed* to O'Donnell.

Unfortunately, that collapses, too.

You see, O'Donnell murdered his credibility by also telling Horne he'd been friends with Mrs. Kennedy and had convinced her to bury her husband at Arlington National Cemetery. He said, as well, that he'd held a private screening of the original Zapruder film for Mrs. Kennedy a few weeks after the shooting. Just the two of them, of course, calmly watching the murder of her husband when it was undoubtedly the last thing she'd want to watch... But it gets worse. He told Horne that Mrs. Kennedy convinced him to edit TEN FEET from the film, to remove the halo of debris from around the President's head at the moment of the fatal head shot. Well, golly. The entire length of the known film is about six feet.

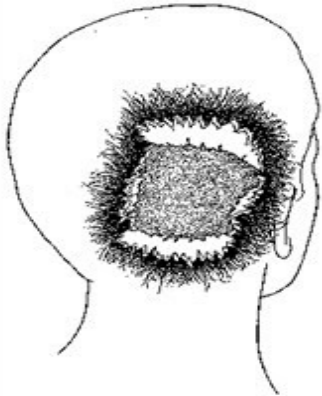

Then, in 2007, after O'Donnell died, the other shoe dropped. The papers printed his obituary, along with a list of some of the famous photos he'd taken. They then got letters from men claiming that no, *they* had taken these photos. This led to a brief investigation, and an article in The New York Times. It was then revealed that O'Donnell had been suffering from dementia since the early 1990's, and that he'd claimed to have taken many famous photos of the Kennedys, including the famous one of John-John saluting his father's casket--*and that he had even been selling prints of these photos at galleries*--but that he, in fact, had taken none of them. As you can imagine, this caused quite a ruckus in the photo world.

I became aware of this ruckus, and posted several articles on this scandal on JFK Forums--hoping word would spread and that conspiracy theorists would stop citing O'Donnell's claims as evidence for anything. In one of these articles, it was revealed that Cecil Stoughton, the main White House photographer at the time of the assassination and a close colleague of Knudsen's, had said he'd never heard of O'Donnell, and had doubted O'Donnell's claim his job as photographer with the U.S. Information Agency had brought him into regular contact with Knudsen. As O'Donnell had, admittedly, never met Knudsen's family, this left conspiracy theorists with NO support for O'Donnell's claims. None that he'd seen photos. None that he'd even known Knudsen. For all they knew, he'd read the 1977 article on Knudsen somewhere or had simply remembered his name from his days with the USIA, and had invented his story from whole cloth. He was a proven liar...who'd told numerous lies in which he'd placed himself close to the Kennedys...and who, in the interview in which he described the autopsy photos showing a wound on the back of the head, had told a couple of whoppers--which few, if any, conspiracy theorists take seriously--in which he and Jacqueline Kennedy were the best of pals and where she convinced him to edit the Zapruder film.

And so, in December 2009, when I first received my copy of Doug Horne's Inside the Assassination Records Review Board Volume 2, I immediately turned to the section on O'Donnell. I was aghast. Horne wrote that he was "*personally inclined*" to accept O'Donnell's recollections, and presented him as support for the possibility Knudsen took a second set of super secret autopsy photos never put into the Archives. No mention of O'Donnell's dementia. No mention of his obvious obsession with the Kennedys. No mention that, oh yeah, by the way, there's a strong likelihood this old guy's story is bullshit.

Horne had either fallen asleep for two years, or had thought his readers need not know that O'Donnell-- a man whose story had gained quite a bit of traction among those thinking Kennedy's body had been altered--was, quite literally, demented.

JFK and the Unthinkable

Beverly Oliver:
Phillin Willis:
Marilyn Willis:
Ed Hoffman:

At left, a drawing by Philip Johnson created for Josiah Thompson, in an attempt to depict the large head wound as observed by Dr. McClelland. Amazingly, the recollections of all the witnesses pictured on this page have been presented as support for the accuracy of this depiction. As the wound location in a number of these recollections was far closer to the wound location demonstrated on the autopsy photos than on Johnson's drawing, and as a number of these witnesses subsequently deferred to the accuracy of the autopsy photos, this is not exactly honest.

JFK and the Unthinkable

Well, no surprise, it turns out that many of the other witness statements used to sell that Kennedy was shot from the front offer as little real support for the proposition as those of Boswell, Stringer, Robinson, and O'Donnell.

In his best-selling and highly-influential book High Treason, published 1989, Robert Groden held that the wound location depicted in the "McClelland" drawing "*was verified by every doctor, nurse, and eyewitness as accurate,*" and that these witnesses described an "*exit wound... almost squarely in the*

back of the head (the occiput)."

In his more photo-intensive follow-up, *The Killing of a President* (1993), moreover, Groden appears to back up this claim. The photographs of 18 witnesses pointing to their heads are presented, accompanied by the following text:

"The Parkland Hospital doctors were the best eyewitnesses to the President's wounds. They had at least 20 minutes, and some had longer, to examine the President's injuries immediately after the shooting. The doctors' oral and written statements provided the only reliable clues to the snipers' locations and bullet trajectories..."

From this one might assume the witnesses presented were at Parkland and had 20 minutes or more in which they viewed the President's wounds. But this is far from the case. Only 10 of these witnesses were at Parkland and very few of these witnesses got much of a look at the President.

When one studies the photos of these witnesses, moreover, there's a bigger surprise. Many of these purported "back of the head" witnesses are not actually pointing to a wound location on the back of their heads, as one would guess, but are instead pointing out a wound location on the top or side of the head, at locations just as close or closer to the wound location depicted in the autopsy photos and x-rays as the wound location depicted in the so-called "McClelland" drawing...the drawing they'd purportedly "verified."

(Although Groden, in *The Killing of a President*, claims Dr. McClelland himself made this drawing, he is clearly mistaken. In June, 2010, Josiah Thompson, who first published the drawing, wrote me and confirmed that while this famous drawing--which has come to represent the "actual" location and appearance of the president's large head wound to many, if not the majority, of conspiracy theorists--was based upon Dr. McClelland's description of the large head wound to the Warren Commission, Dr. McClelland had in fact *"had nothing to do with the preparation of the drawing."*)

And it's not as if Groden is the only one making false claims about these witnesses... Here is how Dr.s Mantik and Wecht address this issue in *The Assassinations*, published 2003: *"The compilations of Gary Aguilar, M.D., have convincingly shown that the Parkland Hospital physicians and nurses, and even the Bethesda autopsy personnel themselves, almost unanimously recalled a large hole at the low right rear of Kennedy's head."* And, as if to prove their calling this wound "low" was not a mistake, they later ask *"Was cerebellum missing at the low right rear, where the Parkland medical witnesses (including six physicians) saw massive trauma?"* Now, look back at the photos in Groden's book reproduced on the previous slides... Is it a true statement that these witnesses "almost unanimously" pointed out a wound location at the LOW right rear of their heads? NO. NO. And HELL NO.

Let's count then and make it official. First of all, we need to define our terms. For a wound to be LOW on the back of the head, it would have to be at the level of the ear or below, in the location of the wound in the "McClelland" drawing, correct? So let's run back through the photos and note which ones show someone pointing out a wound below the top of their ear.

Beverly Oliver points out a large wound at the level of the ear and above. She represents 1 witness whose recollections are consistent with a wound at the low right rear.

Phil Willis points out a wound above the level of his right ear. This means only 1 of 2 witnesses so far discussed have had recollections consistent with a wound at the low right rear.

Marilyn Willis points out a wound on top of her head. This lowers the ratio to 1 of 3 witnesses.

Ed Hoffman points out a wound at the top of the back of his head. This lowers it further to 1 of 4 witnesses.

Ronald Jones points out a wound above and in back of his ear. This means the recollections of but 1 of 5 witnesses so far discussed are consistent with what Groden, Aguilar, Mantik, and Wecht have been feeding us.

Charles Carrico points out a wound on the back of his head above his ear. The ratio drops to 1 of 6 witnesses.

Richard Dulaney points out a wound at the top of his head. It spirals downward to 1 of 7 witnesses.

Paul Peters points out a wound above his ear. It's clear now that only 1 of 8 witnesses had recollections consistent with what so many have long claimed.

Kenneth Salyer points out a wound on the side of the head, by the ear. It bottoms out at 1 of 9 witnesses.

Robert McClelland points out a wound on the back of his head, both below and above the top of the ear. This means but 2 of 10 witnesses so far discussed had recollections consistent with a wound at the low right rear.

Charles Crenshaw points out a wound mostly behind the ear. He lifts the ratio back to 3 of 11 witnesses.

Audrey Bell points out a wound at the level of her ear. The ratio soars to 4 of 12 witnesses...1 in 3.

Theran Ward points out a wound by the ear. It drops back to 4 of 13 witnesses.

Aubrey Rike points out a wound on the back of the head above the ear. The ratio drops to 4 of 14.

Paul O'Connor points out a wound behind the ear. The ratio rises back to 5 of 15 witnesses.

Floyd Riebe points out a wound behind the ear. Now, 6 of the 16 witnesses have depicted a wound at the low right rear.

Jerrold Custer points out a wound behind the ear. Now, 7 of the 17 witnesses have depicted a wound consistent with the wound described in the conspiracy literature.

Frank O'Neill points out a wound on the back of his head above the ear.

So there you have it. Only 7 of these 18 witnesses can honestly be claimed to have described a wound at the "*low right rear*" a la Mantik and Wecht, at the "*bottom of the back of the head*," a la Lifton, or in the location depicted in the "McClelland" drawing, a la Groden. 7 of 18, need it be said, is not the "*almost unanimous*" claimed by Mantik and Wecht, based on the research of Aguilar, nor the "*every*" purported by Groden.

But it's actually worse than that... FAR worse than that. Now, let's go through Groden's "witnesses" again, taking into account circumstances and statements not provided those relying on Groden's book.

Groden starts out with the photos of four witnesses who claimed to have seen the shooting.

While **Beverly Oliver** claims to have been one of the closest witnesses to the shooting, many if not most long time researchers doubt her claims, as she only came forward years after the shooting, and told some pretty wild stories. Even so her description of a wound on the back of the head is in keeping with the wound described by Dr. McClelland, and the drawing prepared by Phillip Johnson. **Back of the head witness.**

Although **Phil Willis** made several statements over the years indicating he thought the fatal shot blew out the back of Kennedy's head, he was clearly repeating what his wife and daughters had told him. You see, he'd testified before the Warren Commission that he was not looking at Kennedy at the time of

the head shot. **Not actually a witness.**

Although **Marilyn Willis**, Phil's wife, was a witness to the head shot, and said the wound was on the "back" of Kennedy's head, when ultimately asked to point out the location of the wound she saw from 50 yards or so away, she pointed to a location high on the top of her head above her right ear. **Top of the head witness.**

While deaf-mute **Ed Hoffman** only came forward years after the assassination, and while his stories of watching the shooting from a nearby freeway and then seeing Kennedy's wounds as the limo passed underneath were never fully accepted, he was at least consistent on one point: he always placed the head wound on the top of Kennedy's head. Not always in the same way, mind you. While the photo in Groden's book shows Hoffman with his hand over the crown of his head, and his fingers over the wound location shown in the autopsy photos, other photos found online show him with his hand forward of this location, and more in line with the wound seen on the autopsy photos. **Top of the head witness.**

Groden then presents the photos of ten witnesses observing Kennedy's wound at Parkland Hospital.

The Impersistence of Memory

Below left: Dr. McClelland in *The Men Who Killed Kennedy*. Below right: Dr. McClelland in *JFK: An Unsolved Murder*.

At right: Brad Parker's signed copy of the McClelland drawing. Note that McClelland claims he "made" the drawing.

Although many conspiracy theorists find Dr. Robert McClelland to be credible, and believe his statements suggest there was a "blow-out" wound on the far back of Kennedy's head, this is far from the case. When one compares his depictions of the wound location in *The Men Who Killed Kennedy*, first broadcast October 25, 1988, and KRON TV's *JFK: An Unsolved Murder*, first broadcast November 18, 1988, it's obvious the wound in McClelland's memory had slipped an inch or two down the back of his head. (Just look at the locations of his fingers in comparison to his hairline...) As Dr. McClelland had long admitted that a viewing of the Zapruder film convinced him the fatal head shot came from in front of Kennedy, it seems possible this decision colored his memories, whereby the wound in his recollection had crept ever so slowly toward the back of Kennedy's head. Or perhaps not. In any event, by the early 90's his memory had slipped so badly that he began claiming HE'D "made" the so-called "McClelland" drawing showing a wound LOW on the back of Kennedy's head--a drawing made for writer Josiah Thompson, who'd never even spoken to McClelland.

The Impersistence of Memory

As one might expect, the head wound location pointed out by **Dr. Robert McClelland** is fairly consistent with the head wound location depicted in the drawing by Johnson based upon McClelland's

Warren Commission testimony. Fairly consistent but not fully consistent. McClelland's hand in the photo is, in fact, on the back of his head almost entirely above his ear, which places the wound about two inches higher on the back of the head than in the drawing. This is not surprising. As previously mentioned, Josiah Thompson, who'd arranged for the drawing's creation, insists that Dr. McClelland had actually had "nothing to do with" its creation. What is surprising, however, is that, shortly before Dr. McClelland pointed out the wound location in the footage used by Groden, Dr. McClelland had pointed out the wound location for the 1988 documentary *The Men Who Killed Kennedy*, and had at that time placed his hand *on the top of his head, above and behind his right ear*, perhaps two inches to the rear of the wound's location in the autopsy photos, but *at least three inches away from its location in the so-called "McClelland" drawing*.

Or maybe this isn't surprising. I mean, it's not as if McClelland's recollections are all that reliable...

Although he stood at the head of Kennedy in the ER at Parkland and was thus well-positioned to note his fatal wounds, McClelland's initial report claimed the fatal wound was on Kennedy's left temple, and not his right. While he would later claim he wrote this after Dr. Jenkins led him to believe there was a separate entrance on the left temple, this fails to explain why Dr. McClelland wrote that *"The cause of death was due to massive head and brain injury from a gunshot wound of the left temple."* By writing *"of the left temple,"* as opposed to *"to the left temple,"* McClelland had failed to indicate there was any wound anywhere but on the left temple. This suggests that, perhaps just perhaps, Dr. McClelland actually thought the large head wound was near Kennedy's right temple, and that he'd confused his right with his left after looking at Kennedy upside down.

Now, this might seem unfair. Dr. McClelland appears to be a very nice man, and has been most helpful to researchers and writers. But some of his claims are clearly wrong. On November 4, 2009, he told Canadian radio personality Brent Holland that the "massive" wound on the back of Kennedy's head was "at least five inches in diameter." Such a wound would, of course, envelop the entire head. When discussing the drawing made for Thompson with the ARRB in 1998, moreover, McClelland noted that *"the edge of the parietal bone was sticking up through the scalp. And that's not on this picture"* and that the location of the wound in the drawing compared to its actual location was *"a little bit lower or it doesn't indicate that there was still a - you know, maybe a shelf of bone left below that."* He also made a monstrous gaffe, explaining *"but what we were trying to depict here was what the posterior part of the wound looked like. In other words, it's not the entire wound. It's simply the posterior part of it and what I thought of as the critical part of it at that time and still do."* Yep. That's right. Dr. McClelland had admitted both that the wound stretched further forward than depicted in the drawing, and not as low on the back of the head. And had added as a bonus that he'd helped create the drawing.

It's actually worse than that. Since at least his appearance in the 1988 Nova program *Who Shot President Kennedy?*, McClelland has claimed a connection to the "McClelland" drawing that simply does not exist. (In the program McClelland claims *"I find no discrepancy between the wounds as they're shown very vividly in these photographs and what I remember very vividly"* but then observes that, on the autopsy photos he'd just studied in the archives, *"there doesn't seem to be any sort of wound in the area where I had drawn the picture that showed this large hole."*) Now, admittedly, that statement by itself is confusing.

But his subsequent statements and actions are not. In Robert Groden's 1993 documentary *JFK: The Case for Conspiracy*, McClelland holds up a copy of the drawing for the camera and declares *"This is the drawing I had made for Josiah Thompson's book."* In 1994, even worse, he signed a copy of the "McClelland" drawing for researcher Brad Parker and indicated that he'd personally created the drawing. According to Thompson, of course, McClelland had *nothing* to do with the drawing's creation. He did not draw it. He was not consulted on its creation. Nothing... Ouch. The impersistence of human memory. **Back of the head witness who does not support the accuracy of the McClelland drawing.**

Dr. Paul Peters, on the other hand, has tried to have it both ways. Although he had repeatedly claimed the wound he saw was in the "occiput" or the back of Kennedy's head, and is pictured in Groden's book pointing to this location, he also told the producers of the PBS program Nova, after viewing Kennedy's autopsy photos in 1988, that the autopsy photos were *"pretty much as I remember President Kennedy at the time."* He then confirmed his support for the legitimacy of the autopsy photos by telling Gerald Posner in 1992 that the *"head wound is more forward than I first placed it. More to the side than to the rear."* When interviewed by the ARRB in 1998 and given yet another chance to claim the autopsy photos and x-rays were fake, moreover, he claimed instead that *"I was amazed when I saw the first x-ray of the skull — the lateral skull--of the extent of the fragmentation of the skull. I did not appreciate that I think because a lot of it was covered by scalp at the time we worked on him. We were doing a resuscitation, not a forensic autopsy."* He had thereby deferred to the accuracy of the x-rays. When discussing the location of the wound in the McClelland drawing, for that matter, he shared: *"It looks a little further down in the occiput in this picture."* When trying to explain the intact back of the head in the back of the head photo, on the other hand, he claimed: *"It was my thought exactly that they just kind of pulled that flap back into place and took a picture so they could show how it looked with things restored as much as possible and it just -- a flap just kind of -- had been torn back and now they were just kind of putting it back and snapping a picture. For what reason, I don't know. But I'm certain there was a hole there, too. I walked around right and looked in his head. You could look directly into the cranial vault and see cerebral injury to the cerebral cortex and I thought at the time to the cerebellum. So I know the hole was big enough to look into. I estimated it at seven centimeters at that time, and I don't know what the actual measurements were when they took the radiographs, but I thought just exactly what Bob, did. They were probably making a series of pictures and they had just pulled that flap back up there to cover it up and took a picture of that to show the head with the flap restored, so to speak, for whatever reason. I'm sure there were many other pictures that were made at the same time."*

Back of the head witness who does not support the accuracy of the McClelland drawing, and presumes the authenticity of the autopsy photos.

Fortunately, **Dr. Kenneth Salyer** was a little more consistent. But only a little. From his Warren Commission testimony to the present day, he always claimed the wound was primarily a temporal wound...on the side of the head. The photo in Groden's book, moreover, shows him grabbing the side of his head, just above his ear, an area at least as suggestive of the wound in the photos as the one in the "McClelland" drawing. **Side of the head witness.**

Dr. Charles Crenshaw, of course, became a star witness for the supposed wound on the "back of the head" when he wrote a book on his experiences in the early nineties. The problem with Crenshaw as a witness, however, is that, not only did he fail to see Kennedy for more than a few seconds, his recollections were not recorded prior to the publication of the "McClelland" drawing showing him how other Parkland witnesses purportedly recalled the wound. **Back of the head witness.**

Dr. Ronald Jones, as Peters, has claimed many times over the years that the wound was on the back of Kennedy's head. In the photo in Groden's book, however, he points to a wound location slightly to the side of the wound on the "McClelland" drawing. In 1992, even stranger, he described the wound as a *"side wound."* In 1997, in a letter to researcher Francois Carlier, Jones tried to explain his confusion; he insisted that although he observed a wound on the *"posterior aspect of the skull,"* he was *"unable to observe the exact extent or dimensions of this wound"* because of his *"position at the table on the left side of the President below his arm"* while the President was lying *"flat on his back."* When interviewed by the ARRB in 1998, for what's worse, he offered more excuses, insisting *"it was difficult to see down through the hair,"* and admitting *"All my view was from the President's left side."* He then clarified this position to researcher Vincent Palamara, first admitting that he really didn't have *"a clear view of the back side of the head wound. President Kennedy had very thick dark hair that covered the*

injured area" and then offering *"In my opinion it was in the occipital area in the back of the head."* He had thereby confirmed that he'd failed to see the large hole missing scalp and bone depicted in the "McClelland" drawing. **Back of the head witness who does not support the accuracy of the McClelland drawing, and defers to the accuracy of the autopsy photos.**

As the first doctor to inspect Kennedy upon his arrival at Parkland, **Dr. Charles Carrico** would certainly have been in good position to accurately note the wound location on Kennedy's head. While the wound location he points to in Groden's book is actually a bit too high for anyone to claim he confirmed the "McClelland" drawing, it's really academic. You see, on January 11, 1978, Dr. Carrico was interviewed by the HSCA staff, and specified that the head wound was "five to seven centimeters, something like that, 2 1/2 by 3 inches, ragged, had blood and hair all around it," and was "located in the part of the parietal occipital region...*above* and posterior to the ear, almost from the crown of the head." Uhhh, this is clearly NOT the wound depicted in the McClelland drawing. In 1981, when the Boston Globe asked him specifically about the "McClelland" drawing, moreover, Carrico replied "it was a very large wound as indicated in the drawing. However, I do not believe that the large wound was this far posterior since, one thing I can be certain of, is that we were able to see the majority, if not all of this wound, with the patient laying on his back on a hospital gurney. The location of the wound represented in the drawing suggests that it would barely have been visible, if visible at all, with the patient laying in such a position." When asked to comment on the HSCA's tracing of the back of the head photo, in which the back of the head is intact and the wound is above the ear, moreover, he told them there was "nothing incompatible" between what he remembered and the drawing. Well, that oughta seal it, but if that's not enough, Dr. Carrico eventually made his rejection of the McClelland drawing's accuracy crystal clear. In 1992, he told single-assassin salesman Gerald Posner that if he and his colleagues had initially claimed the head wound was in the occipital bone, instead of the parietal bone, they "were mistaken." Yep. It's a slam dunk case. Dr. Carrico rejected the accuracy of the McClelland drawing, and deferred to the accuracy of the autopsy photos. **Back of the head witness who does not support the accuracy of the McClelland drawing, and defers to the accuracy of the autopsy photos.**

Although **Dr. Richard Dulaney** made a number of statements over the years suggesting the large head wound was on the back of Kennedy's head, the wound location he points to in Groden's book and video is up at the top of the head...as close to the wound depicted in the autopsy photos as the one depicted in the "McClelland" drawing. Only making matters worse for those claiming him as a "back of the head" witness, moreover, is that, in 1988, after viewing the autopsy photos, he told the producers of the television program Nova *"I don't see any evidence of any alteration of his wound in these pictures from what I saw in the emergency room."* **Top of the head witness who defers to the accuracy of the autopsy photos.**

Nurse **Audrey Bell** is similar to Dr. Crenshaw in that, while she has been consistent in her claim that the wound was on the back of Kennedy's head, there is no record of her making this claim prior to the 1980's, long after the "McClelland" drawing was published in Six Seconds in Dallas. **Back of the head witness.**

Justice of the Peace **Theran Ward** is also similar to Dr. Crenshaw, in that he really didn't get much of a look at the head wound. Even so, when one looks at the interview with Ward in Groden's Case for Conspiracy video, and in the image on the slide above, it's clear that Ward, much as Dr. Salyer, felt the wound was on the side of Kennedy's head, and not the back. **Side of the head witness.**

This brings us to the final Parkland witness presented in Groden's book. And he wasn't even a witness... While ambulance driver **Aubrey Rike** claimed to feel a hole in the back of Kennedy's head as he helped put his body in its casket, he has always admitted the head was covered at the time, and that he never actually saw the wound. As a result it's possible Rike was mistaken, or merely confused by the

fractured bone on the back of the skull seen on the x-rays. **Not actually a witness.**

We now move to the Bethesda "back of the head" witnesses... The statements of these witnesses, purported to confirm the Parkland doctors' account of the wounds, should seal the deal if there was really a wound on the back of the head behind the ear.

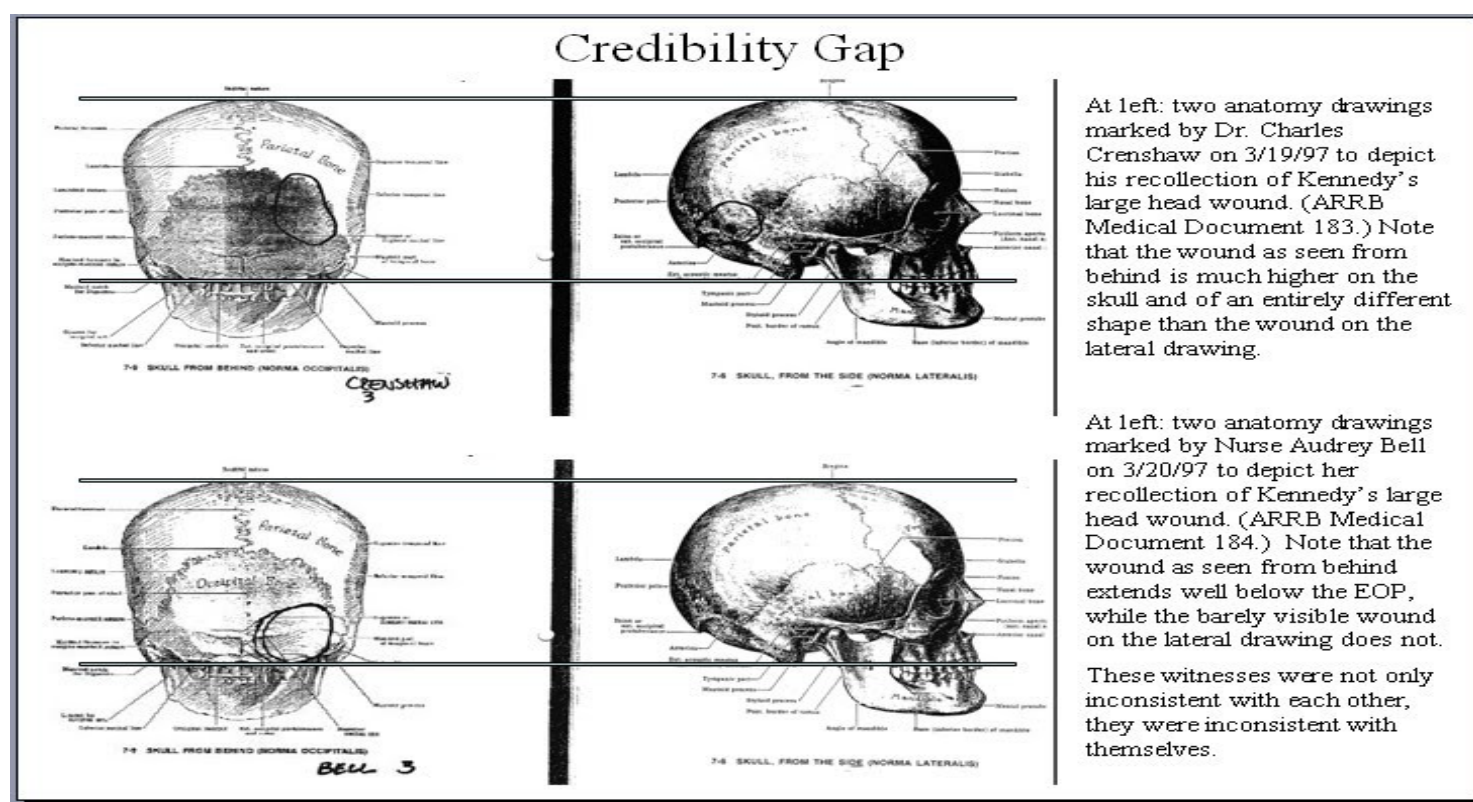

Unfortunately, they do no such thing. While radiology tech **Jerrol Custer** made many statements over the years indicating that he thought the autopsy photos and X-rays were faked, he actually told the ARRB, after having finally been shown the original X-rays, that they were indeed the ones he took on 11-22-63, and that he had been in error. This, of course, was years after the publication of Groden's book. Even so, when one watches Groden's video, JFK: The Case For Conspiracy, one can see that Custer was never really a "back of the head" witness, as he does not point out a wound on the back of Kennedy's head, as suggested by the frame used in Groden's book, but drags his hand across the entire top of his head while claiming the wound he saw stretched "From the top of the head almost to the base of the skull..." He was thereby describing the wound's appearance after the scalp was reflected, and the brain was removed. (In support of this proposition, it should be noted that he'd also claimed there was no brain in the skull that he could remember.) **Entire right side of the head witness. Defers to the accuracy of the autopsy photos.**

Ditto **Paul O'Connor**. While O'Connor, as Custer, had made many statements over the years suggesting the autopsy photos and X-rays had been faked, his credibility, seeing as he'd depicted the wound location in the upper right quadrant of the back of the head in a drawing he'd created for the HSCA, and then moved it to beneath the top of the ear years later, was questionable. In Groden's video The Case for Conspiracy, moreover, O'Connor repeated Custer's performance almost word for word, stating there was "an open area all the way across into the rear of the brain right there," while pointing out the dimensions of this hole--basically the dimensions of the hole after Kennedy's scalp had been reflected, and his brain had been removed. O'Connor, as Custer, also claimed no brain was in the skull when he observed the large defect. He was thereby, like it or not, supporting the accuracy of the autopsy photos and the official story of the wounds. **Entire right side of the head witness.**

Ditto ditto assistant autopsy photographer **Floyd Riebe**. Much as Custer, Riebe made many statements suggesting the autopsy photos were fake--in Groden's book, he even pointed at the location of the wound in the "McClelland" drawing. Once shown the original photos by the ARRB, however, he, too, deferred to their accuracy. **Back of the head witness who defers to the accuracy of the autopsy photos.**

This leaves us with **Frank O'Neill**, one of the two FBI agents to observe Kennedy's autopsy. While O'Neill told pretty much anyone with an interest--the HSCA, the ARRB, and a string of independent researchers from the 80's to the 00's--that the large head wound included part of the back of Kennedy's head, he always placed this wound at the top of the back of the head, inches above the wound in the "McClelland" drawing. He also claimed, in his official report on the autopsy, that a *"high velocity bullet had entered the rear of the skull and had fragmentized prior to exit through the top of the skull."* This wound was thus, to his understanding, both an entrance and an exit. On April 4, 1992, for that matter, O'Neill participated in a panel discussion before an audience at the Franklin Pierce Law Center in Concord, New Hampshire, and both confirmed that he thought this wound was both an entrance and an exit, and explained why he thought the wound was on the back of Kennedy's head. (A transcript for this discussion was placed online by Allan Eaglesham. Thanks, Allan.) O'Neill reported that *"during the autopsy, later stages of the autopsy"* the Secret Service brought in a fragment *"of a skull, which was found in Dallas in the car. And it turns out that it could be matched perfectly with part of the missing, part of the missing skull in the head—and there's beveling on that which coincides with the beveling on the eh, the eh, on the back of the president's head here."* He then pointed to the back of his head, by the EOP.

Well, this was where the autopsy report placed a through and through entrance wound. According to their initial reports and testimony, the doctors found exit beveling on the fragment found in the car, and this confirmed to them that the exit wound was at the top of the head. This convinced them then that the bullet entered low and exited high. Apparently, however, O'Neill was never told of the through and through entrance wound by the EOP. As a result, he couldn't properly understand how the doctors came to the conclusion the bullet entered low and exited high. Presumably, then, he came to conclude that the beveling on the late-arriving fragment completed the entrance wound by the EOP. And this, in turn, led him to believe the late-arriving fragment derived from the back of the head. While this is undoubtedly intriguing--particularly in that, from the seventies on, Dr. Boswell remembered this fragment fitting into the skull in the same manner--it also underlines the reality of O'Neill's recollections. The man felt certain the wound was entirely above the EOP, and felt sure it was both an entrance and exit wound, NOT an exit wound for a bullet hitting Kennedy on the front of his head. **Top of the head witness.**

Credibility Gap

So now a final tally... Of the **18** witnesses presented by Groden to demonstrate that the bulk of the Parkland and Bethesda witnesses believed there was an exit on the far back of the head--an exit purported to be centered in the occipital bone--**2** never saw the wound, **2** depicted a wound encompassing the entire right side of the head, **2** depicted the wound on the side of the head, **4** depicted the wound on the top of the head, and **3** depicted a wound on the back of the head, but apparently came to accept they were mistaken, and deferred to the accuracy of the autopsy photos. This means that only **5** witnesses actually believed the wound was on the far back of Kennedy's head, and **2** of these--Peters and McClelland, were inconsistent in their statements but ultimately claimed they believed the wound to be further forward than in the "McClelland" drawing. This means that but **3** witnesses felt comfortable asserting the large head wound was really behind the ear in the occipital bone, as purported

by most conspiracy theorists and as presented in the "McClelland" drawing: Crenshaw, Bell, and Oliver.

Well, Crenshaw, Bell and Oliver never described the wound location until many years after the "McClelland" drawing was published. And Oliver, when describing the wound to Robert Groden for his video, JFK: The Case for Conspiracy, told him "The whole back of (Kennedy's) head went flying out the back of the car," something no one--not even Groden--honestly believes.

This leaves Crenshaw and Bell as the only two witnesses presented by Groden who can reasonably be taken as confirming the wound depicted in the "McClelland" drawing.

And their credibility--already questionable due to the many years between the time of the shooting and the time they first began describing the wound--was pretty much eradicated by the ARRB.

It is important here to recount Dr. Crenshaw's previous descriptions of Kennedy's head wound. (Most of these were drawn from JFK: The Medical Evidence Reference, by Vincent Palamara.)

In 1992, Dr. Crenshaw's book Conspiracy of Silence arrived on the scene and claimed that the "entire right cerebral hemisphere appeared to be gone...From the damage I saw, there was no doubt in my mind that the bullet had entered his head through the front, and as it surgically passed through his cranium, the missile obliterated part of the temporal and all the parietal and occipital lobes before it lacerated the cerebellum." Well, this doesn't sound like the exit wound on the back of the head purported by most conspiracy theorists, now does it? It sounds more like a giant wound enveloping a large portion of the top, side, and back of the head.

But no, Crenshaw was describing a wound on the far back of the head. On April 2, 1992, he appeared on ABC's 20/20 news program, and pointed to his hairline above his right eye, and explained that, in his opinion, the bullet went "from here through," whereby he pointed to the back of his head behind his ear. He then finished the interviewer's sentence, explaining that this bullet took out "The back or the occipital part--the back of your head." He then reiterated, while pointing to a location behind and well below the top of his right ear that "This was gone, in our view. And we could see the cerebellum." He then explained that if the bullet had come from behind, it would have exploded from the top of Kennedy's head, whereby he pointed out the wound location shown on the autopsy photos and Zapruder film. This made it clear he recalled no such wound.

Now watch how things get muddy, real muddy. This same month, April 1992, Crenshaw wrote a letter to writer Harrison Livingstone, in which he claimed the bullet striking Kennedy "to the right rear side of his head, obliterated part of the parietal, part of the temporal, and all of the occipital area. This resulted in a gaping hole, the size of a baseball, in the back of the head, and the cerebellum was hanging on a thread of tissue outside the wound." Note that he has now retreated from his conjecture the bullet entered the forehead. Note also that he has stopped musing on the damage to the parietal and temporal lobes of the brain, which could not be readily observed through the hole on the back of the head.

In June, moreover, Crenshaw spoke at the First Midwest Symposium, a conference on the Kennedy assassination. Here, he reported that the wound he saw was in the "parietal occipital area" and was "an obvious exit wound." This is slightly above the wound he described on 20/20, and is more in line with the wound described by his fellow doctors. Perhaps Dr. Crenshaw was growing more cautious.

On July 22, 1992, Dr. Crenshaw was finally interviewed by the FBI. The report on this interview asserts that Dr. Crenshaw claimed that "The head wound was located at the back of the President's head and was the approximate size of Doctor CRENSHAW's fist. It extended from the approximate center of

the skull in the back to just behind the right ear, utilizing a left to right orientation, and from a position a couple of inches above the right ear to the approximate middle of the right ear utilizing a top to bottom orientation." The report further explained that Dr. Crenshaw's "description which indicates that the wound extended from the hairline back behind the ear and to the back of the head was 'poorly worded' in his book and that "The correct description indicates that the wound was located entirely at the rear of the head behind the right ear." Okay, so here we finally get some clarification. Crenshaw has indeed retreated from the descriptions of brain damage in his book, and is now claiming, in opposition to what he told 20/20, that the wound stretched from the right top of Kennedy's head behind his right ear to the middle of the back of his head.

On September 4, 1992, furthermore, the editor of the Journal of the American Medical Association called a press conference, and challenged Dr. Crenshaw's recollections and overall credibility. Crenshaw was then interviewed on radio station WBAI. His comments were transcribed by researcher John DiNardo, and saved for posterity and re-posted for our edification by Bernice Moore. Here Crenshaw clarified that "The head wound was tangential in nature, coming in over the right side, above his ear, and leaving a large exit area, avulsed area in the right-rear part of the head. There was loss of part of the parietal, temporal and most of the occipital lobe of the right cerebral hemisphere, with exposure of the cerebellum. It was about two-and-a-half to two- and-three-fourths inches in diameter. It was more or less circular." Well, this pretty much supports what he told the FBI, and is pretty much what the other Parkland witnesses remembered. Gone is his earlier suggestion the bullet entered Kennedy's forehead above his right eye. Gone is his earlier claim the exit on the back of the head was below the top of his ear. He saw but ONE WOUND on Kennedy's head, which he assumed to be of entrance and exit, with avulsed, or inside-out skull.

He has thereby described the wound shown on the autopsy photos, only inches further back.

He has retracted his claims in smaller, less noticeable, ways as well. While he'd previously said "all" the occipital lobe and "all the occipital area" were obliterated, he now said there was a loss of "most of the occipital lobe."

Now, perhaps Crenshaw's memory was not at fault. Perhaps, instead, he was merely prone to exaggeration. One notes that the damage that had once engulfed part of the temporal, all of the parietal and all the occipital has over a fairly short time morphed into damage engulfing part of the temporal, part of the parietal, and most of the occipital.

Still, this doesn't make Crenshaw so unreliable that one can readily dismiss his claim *some* occipital was involved, does it? This last description, after all, was fairly consistent--meaning within an inch or so--with the wound location presented by Crenshaw in *The Killing of a President*, which is itself fairly consistent with the McClelland drawing.

So, what's the problem?

The problem is that, in 1997, when asked by the ARRB to mark the head wound location on an anatomy drawing of a skull viewed from behind, Crenshaw placed this wound almost entirely on the occipital bone, behind and almost entirely below the top of Kennedy's ear. This is about two inches below and further back from the location he'd described to the FBI. More telling, when asked to mark the wound location on a lateral drawing of the skull, Crenshaw placed the wound on the occipital and parietal bone, an inch or so lower, and perhaps as much as two inches forward, from the location he'd marked on the drawing from behind. Something is just wrong here. While the upper margin of the wound location depicted by Crenshaw in *The Killing of the President* was roughly at the level of the

middle of the forehead, the upper margin of the wound on this lateral drawing was roughly at the middle of the eye socket. This raises serious, and I mean serious, questions not only about Dr. Crenshaw's memory, but his grasp of basic anatomy.

But what about Nurse Audrey Bell? Well, first of all, there are reasons to doubt she even saw Kennedy's head wound. While she told Jeremy Gunn and Doug Horne of the ARRB on 3-20-97 that she spent 3-5 minutes in Trauma Room One, and had been shown Kennedy's wound by Dr. Perry during this short period, not one of the doctors and nurses filing reports on Kennedy in the immediate aftermath of the assassination, or testifying before the Warren Commission, mentioned her presence in the room. There's no record, moreover, of her talking about what she saw in the years immediately following the assassination. Beyond telling David Lifton in 1982 that the head wound was so localized on the back of the head that she couldn't see it from Kennedy's right hand side, in fact, she made few comments on the wound location over the years, prior to being interviewed by Gunn and Horne.

Apparently, this was for good reason. When asked by the ARRB to depict the wound location on an autopsy drawing of a skull viewed from behind, sadly, she depicted the wound even lower on the occipital bone than Crenshaw. She depicted it so low, in fact, that, it was in clear contradiction with the earliest reports and statements of Dr. William Kemp Clark, the only doctor at Parkland to actually examine the wound, and even Dr. McClelland, who told the Warren Commission that *"the parietal bone was protruded up through the scalp and seemed to be fractured almost along its right posterior half."*

As a result, her recollections regarding this wound have zero credibility. Much as Crenshaw, she couldn't even be consistent from one drawing to the next. While she depicted the wound both above and below the level of the External Occipital Protuberance on the anatomy drawing presenting the skull as seen from the rear, she presented the wound entirely above the EOP on the drawing of the lateral view. (This is seen more clearly in Volume 1 of Doug Horne's Inside the ARRB than on the slide above.)

Thus, Crenshaw and Bell were not only inconsistent with each other, and the only doctor to examine the wound at Parkland, but with themselves. While they might have been the most fabulous people on God's green Earth, their decades-after recollections of Kennedy's head wound location are clearly just not credible.

So much for the oft-repeated claim that the Parkland staff were "trained witnesses" and could not mistake a wound on the top of the head for a wound on the back of the head... Crenshaw and Bell either couldn't orient a simple anatomy drawing, or were unable to remember where they'd marked the wound only a few seconds earlier.

NOT on the Back of the Head Witnesses

Across top, from L to R: 2 photos of Marilyn Willis, 2 photos of Ed Hoffman

Second row, from L to R: 2 photos of Dr. Richard Dulaney, Dr. Kenneth Salyer, and Theron Ward

When one looks closely at the photos of the purported "back of the head" witnesses featured in Robert Groden's books and DVDs, one finds that many of them actually described a wound a good distance away from the wound depicted in the so-called "McClelland" drawing at left. Some, like those pictured on this slide, described a wound either at the top of the head where one can see the wound in the autopsy photos or at the side of the head. While this should rightfully silence those claiming that we KNOW there was an exit wound on the far back of the head, and that the autopsy photos are fake, it sadly isn't so.

NOT on the Back of the Head Witnesses

Still, even if one were to pretend Crenshaw and Bell were credible, one can't simply assume the wound was where they said it was, when so many equally or more credible witnesses, when later put to the test and asked where they saw the wound, either pointed to a location NOT on the far back of the head behind the ear, OR deferred to the accuracy of the autopsy photos.

Or, to put it another way... For years people have been getting away with insinuating that all witnesses describing a large head wound different than the one seen in the autopsy photos were really describing the wound on the back of the head in the location of the wound in the "McClelland" drawing, a wound on the occipital bone from which cerebellum flowed....when in reality many of these so-called "back of the head" witnesses were "NOT on the back of the head" witnesses.

Now, I am far from the first to notice this. Not only have single-assassin theorists such as John McAdams taken the time to point out that many of the Parkland witnesses described a wound not on the back of the head, but conspiracy theorists such as the late Hal verb have done so as well. In fact, in 1998, Verb aroused the ire of the same clique as I when he pointed out in a series of articles and letters in the assassination journal *The Fourth Decade* that the eyewitnesses suggested there was in fact no blow-out on the back of the head.

I do suspect, however, that I am the first to point out that the photographs of the witnesses pointing out the wound location--the very photographs purported to PROVE there was a wound on the far back of the head--prove no such thing. And, thankfully, I'm no longer the only one noticing this.

On December 12, 2010, on the Education Forum, my contention that the location of the wound described and depicted by the witnesses failed to match the descriptions of the wound location provided by most conspiracy theorists received some much appreciated support. In response to a post by Dr. James Fetzer, in which he claimed I was wrong and that the "McClelland" drawing really was drawn by Dr. McClelland, Six Seconds in Dallas author Josiah Thompson wrote:

"It is one of the oldest mistakes in JFK research to ascribe the the sketch in Six Seconds[u] to Dr. McClelland. I've been telling people for years that McClelland had nothing to do with the preparation of this sketch. I took a Polaroid photo of the right back of my head and sent it to a medical illustrator in Philadelphia. I included the actual text of McClelland's description of the Kennedy back of the head wound and paid the medical illustrator to draw it. Hence, it is just false that Dr. McClelland made the sketch. I never even asked him for his opinion on the sketch. The sketch then is the interpretation of a medical illustrator of what Dr. McClelland described.

Pat Speer "comes up with this stuff" by doing what a good researcher ought to do: asking questions and getting direct answers from people who are in a position to know.

His analysis of the various descriptions of damage to the back of Kennedy's head is quite illuminating. He should be praised for not accepting the usual superficial interpretations of these witness reports. So fume as much as you like, but Pat Speer is 100% correct and you are 100% incorrect.

Josiah Thompson "

SO...let's be honest here. The mythical wound at the "low right rear" of Kennedy's head is not the only deception regarding the medical evidence cultivated by sellers of conspiracy. For years, conspiracy theorists have been misled into believing not only that the statements of the "back of the head witnesses" were incredibly consistent, but that the location for the wound they were describing overlay the "white patch" on Kennedy's lateral skull x-ray, the shadowy area on the back of Kennedy's head in the Zapruder film, the location proposed by Dr. Cairns for the Harper fragment, and the hole seen in the "McClelland" drawing. This just isn't true.

Beyond that many of the purportedly back of the head witnesses were actually describing a wound on top of the head, and that some of these witnesses, including head nurse Doris Nelson, who told researchers the wound was on the back of the head but then pointed to the location shown on the autopsy photos when posing for Life Magazine (as shown [here](#)), were clearly unreliable, the head wound described by most witnesses was toward the top of the head, mostly above the white patch on the x-ray, and the purportedly painted-in area on the Z-film frames. This area, moreover, was largely on the parietal bone, above the area depicted in the "McClelland" drawing, and inches away from where the Harper fragment purportedly exploded from the occipital bone.

This, then, raises a question...have we been conned? Have those claiming elements of the government conspired to deceive us about the President's wounds been involved in a conspiracy of their own, namely, to make us think there was a hole in Kennedy's occipital bone?

Mr. Livingstone, I Presume

Maybe.

When one looks at the history of the controversy, that is, the history of the purported Parkland/Bethesda divide on the location of Kennedy's large head wound, one finds that much of it was stirred up by writer Harrison Livingstone in the years 1979-1981. In 1979, on a trip paid for by the Baltimore Sun, he went to Dallas and asked a number of witnesses to Kennedy's wounds a series of questions about them, and showed them the HSCA's tracing of the back of the head photo--the photo illicitly copied by Livingstone's soon-to-be-partner Robert Groden. While the Sun never published a detailed article on these encounters, Livingstone did publish his version of such an article in the 11-22-81 issue of The Continuing Inquiry newsletter.

Here are the sections of the article on the witnesses:

1. *"'That's not the way I remember it,' said Dr. Richard Dulany, a medical resident who was on duty in the emergency room when Kennedy was brought in, after looking at a copy of an official autopsy photograph. According to Dr. Dulany, there is a 'definite conflict' between the wounds as portrayed in the photo and the wounds which he observed in the emergency room. There were at least 22 witnesses in Dallas who have described a 'large hole in the back of the head.' Dr. Dulany insists that the photo does not show the large, gaping wound which had blown out the back of the president's head."* (Note that Livingstone fails to reveal the degree of this 'conflict'--was Dulaney told that the autopsy photo he was shown was genuine? Was he willing to sign an affidavit saying the photo was a fake? Or did he simply assume he was mistaken?)
2. *"Dr. Paul Peters, professor and chairman of the Urology Department at the University of Texas Southwestern Medical School at Parkland, also questions the accuracy of the disputed photograph. Dr. Peters told the Warren Commission: 'We saw the wound of entry in the throat and noted the large occipital wound.' After seeing the pictures, he said, 'I don't think it's consistent with what I saw. There was a large hole in the back of the head through which one could see the brain. But that hole does not appear, in the photograph.'"* (Note the lack of certainty. Peters 'questions.' Peters doesn't 'think' it's consistent. In other words, Peters, as Dulaney, was unwilling to say he thought the photo was a fake.)
3. *"The president's widow also described a severe wound at the back of the head to the Commission: 'But from the back, you could see, you know, you were trying to hold his hair and his skull on...'"* (This, as we've seen, was a misrepresentation of her statements, which in fact suggested the wound was at the top of the head, and more readily viewed from behind.)
4. *"Doris Nelson, a Dallas nurse who was the supervisor of the emergency room when Kennedy was brought there, and who helped to treat the dying president, said that government autopsy photos of the skull are 'not true. There was no hair.' She said, while disputing the most controversial photograph, which merely shows a small entry wound in the cowlick area, which is four inches from where the autopsy report itself describes it, 'There wasn't even any hair back there, on the back of the head. It was blown away. All that area was blown out.'"* (Well, here's a decent witness. Of course, she later showed Life Magazine where she thought the wound had been--and it was what most of us would call the top of the head.)
5. *"Claiming that the Photographs were too 'gory,'...the (HSCA) actually published exact tracings of them. It was these tracings, which are described as being accurate down to the last detail, which the Dallas medical witnesses recently evaluated for this report. (One witness, however. Dr. Malcolm Perry of the Cornell Medical Center, was shown prints of the actual photographs by Sun reporters in 1979, and also strongly denounced them as being inaccurate.)"* (Hmmm...Perry was Kennedy's primary physician in the ER, why not quote him directly? Could it be that Perry was not shown the photo by the reporters, as claimed, but by Robert Groden, who kept no notes?)
6. *"The list of medical witnesses who have challenged the autopsy photos includes Dr. Robert McClelland, professor of surgery at the University of Texas Medical School in Dallas."*

Seventeen years ago, he told the Warren Commission that he stood at the head of the operating table in the emergency room 'in such a position that I could very closely examine the head wound, and I noted that the right posterior portion of the skull had been extremely blasted. It had been shattered, apparently, by the force of the shot...in such a way that you could actually look down into the skull cavity.' Recently, after viewing a sketch of the gaping head wound which had been drawn by an independent investigator, Dr. McClelland said that it accurately portrays what he 'vividly remembers' seeing on the operating table after the president was rushed into emergency. He firmly rejected the autopsy photos." (Livingstone failed to reveal that McClelland's initial report on his 'vivid' recollections of the wound on the back of the head...placed the wound in the left temple.)

7. "Margaret Hood (Margaret Henchllffe at the time) had been an emergency room nurse for 12 years prior to the assassination. The nurse, who helped wheel the wounded president into the room and later prepared his body for the coffin, recently drew a sketch of the wound on a skull model provided by reporters. That sketch also showed a large wound at the back of the head. 'You couldn't see much of the wound,' said Ms. Hood. 'It didn't affect his face or ears at all. it was more to the back.' Ms. Hood also strongly disavowed the photographs." (Well, once again, what does that mean-- 'disavowed'? Did she say they weren't consistent with what she remembered? Or did she accuse the government of misconduct?)
8. "Dr. Ronald C. Jones, a professor of surgery who was Parkland Hospital's chief resident in surgery at the time of the murder, originally described for the Warren Commission 'what appeared to be an exit wound in the posterior portion of the skull.' He also rejected the autopsy photos, and drew an outline with his finger of a large hole at the back of an imaginary head. In addition, he described the drawing which Dr. McClelland had approved as 'close.'" (Once again, this was too vague. Is it really a story when someone remembers something a bit differently than it is depicted in some photographs? No, I don't think so. The story comes when that person is willing to swear on a stack of Bibles their recollections are correct, and publicly accuse someone of faking the photographs. None of Livingstone's witnesses have gone that far.)
9. "Patricia Gustafson (then Patricia Hutton), another emergency room nurse at the time of the shooting, helped to wheel the president from the limousine into treatment. Ms. Gustafson, testifying before the Warren Commission, outlined a 'massive opening on the back of the head.' Recently, describing an effort to place a pressure bandage on the head wound, she said: 'I tried to do so, but there was really nothing to put a pressure bandage on. It was too massive. So he told me just to leave it be.' Asked if she was sure about the location of the wound, she said yes: 'It was the back of the head,' she said, while rejecting the autopsy photos." ("Rejecting"? What does that mean? I reject what looks back at me in the mirror each morning, but that doesn't mean I think it's fake, and part of some massive conspiracy.)
10. "Fouad Bashour was an associate professor of medicine in cardiology at the time of the shooting. Interviewed by this reporter at his office in 1979, Dr. Bashour insisted that the official photo which he was being shown did not accurately depict the location of the major wound. 'Why do they cover it up?' he asked several times. 'This is not the way it was.'" (Livingstone hid that Bashour only saw Kennedy's wound for a few seconds.)
11. "Dr. Charles Baxter, interviewed the same day, who had earlier told the Warren Commission 'There was a large, gaping wound in the back of the skull,' also questioned the autopsy photos." (Well, wait a minute. Baxter had told the Warren Commission "There was a large gaping wound in the skull." He had said nothing about the "back of the skull." In fact, it's worse than that. Baxter at first exclaimed "literally, the right side of his head had been blown off," but then later specified that the wound was in the "temporal parietal plate of bone laid outward to the side." This was a wound on the side of the head, and not the back of the head, as claimed by Livingstone. And "questioned"? What's that mean? And why not quote Baxter from his most

- recent interview? It seems likely from this that Baxter was mostly supportive of the photos in his interview with Livingstone, and that Livingstone didn't want to admit as much in his article.)
12. *"After being shown the most controversial photo. Dr. Marion Jenkins (he told the Warren Commission, 'There was a great laceration on the right side of the head (temporal and occipital) . . . even to the extent that the cerebellum had protruded from the wound'), blurted: 'No, not like that. Not like that, because... No, you want to know what it really looked, like? Well, that picture doesn't look like it from the back.' Dr. Jenkins demonstrated several times, on his own and a reporter's head, that the large exit wound had been located on the back of the skull: 'You could tell at this point with your fingers that it was scored out (that the edges were blasted out).'"* (It seems likely from this that Jenkins didn't trust Livingstone's assertion the photo was an official photo, and was simply trying to show them what he remembered. He was certainly much more cautious in his subsequent interviews. This highlights the problem with the article--it shows that the memories of Kennedy's wounds of some witnesses are inconsistent with what is shown in the autopsy photos, but fails to explore the strength of their recollections, or even what this means...if this is in fact unusual for people trying to remember the specifics of something that happened 16 years prior.)
 13. *"Dr. Charles Carrico, now a professor of surgery at the University of Washington in Seattle, was a general surgeon in residency at Parkland when the president was shot--and the first doctor to reach him. He told the Warren Commission about a large gaping wound, a five-by-seven-centimeter defect in the posterior skull, which he observed in the occipital region. But he has not been interviewed since."* (Is it a coincidence that Livingstone failed to interview Carrico, and that Carrico would come to totally reject Livingstone's claims?)
 14. *"In addition to these medical figures, three other physicians who were involved in treating the , stricken president-Doctors Gene C. Akin, Jackie Hunt, and Adolph Giesecke, have not fully endorsed the autopsy pictures."* (In other words, they partially endorsed the autopsy pictures. Well, what part? Since, if they'd said the head wound was wrong, Livingstone would most certainly have let his readers know about it, it seems likely they said they thought the photos of the head wound looked pretty good to them...and that Livingstone didn't want us to know about this.)
 15. *"Two crucial medical witnesses, meanwhile, have not yet been interviewed about the case. Dr. Kemp Clark, who was the senior physician on duty in the Parkland 'trauma room' when the wounded president was brought in, refuses to comment--although he described for the Warren Commission '... a large wound in the right occiput, extending into the parietal region."* (Livingstone hid from his readers that Clark accepted the conclusions of the autopsy report and Warren Commission.)
 16. *"Diana H. Bowron, a British nurse who worked in the Parkland emergency room in 1963, could not be located as of this writing. However, Ms. Bowron did tell the Warren Commission: 'the president was moribund. He was lying across Mrs. Kennedy's knee, and there seemed to be blood everywhere. When I went around to the other side of car, I saw the condition of his head...the back of his head...it was very bad; I just saw one large hole.'" (Aha! A good, credible witness...whom Livingstone hadn't even spoken to...or shown the autopsy photo...)*

It seems clear from this, then, that Livingstone was pushing an agenda in his article, and that he wasn't particularly interested in telling his readers the whole story. I mean, why else short-change the recollections of those "not fully" endorsing the photos, and emphasize the recollections of several others--including Mrs. Kennedy--whom he didn't even interview?

And here are some more reasons to believe he cherry-picked his quotes to push a fantastic theory he

knew few would buy if he was more forthcoming...

First of all, he claimed, in the article, that *"According to the recently interviewed medical witnesses, the president had been shot in the throat, from in front, in addition to the head shot."* Well, this was just not true. Few of the witnesses interviewed by Livingstone even saw the throat wound before it was expanded by Dr. Perry, and those that did never told anyone else that the throat wound they saw WAS in fact an entrance wound...only that it appeared to be one. Now, this is an important distinction. These witnesses made observations, and formed recollections, and may or may not have formed opinions based upon these recollections. But Livingstone claimed they'd both presented these opinions as facts, which would have been thoroughly unprofessional, and universally shared the same opinion. It seems clear, then, that he was putting words in their mouths, and that he was exaggerating, or worse.

Secondly, a 6-11-80 article on Livingstone by Maureen Williams found in the Bangor Daily News suggests Livingstone was not a healthy camper. I know this seems a cheap shot, but stick with me here. This article was on Livingstone at a time virtually no one knew who he was, written in his local paper. The article, it follows, was his idea, or at least written with his full cooperation. And yet, look what it reveals: *"The federal government has stipulated that certain sensitive material concerning the investigation of the assassination of President Kennedy in 1963 cannot be released to the public and media until the year 2039. One man who claims to be living in secrecy and fear for his life in eastern Maine, claims to have gotten some of that material through an underground source with connections in the Pentagon. Harrison Edward Livingstone, one of hundreds of private citizens who are involved in researching the assassination, carries his completed but rough manuscript of his book with him wherever he goes...He has kept on the move in recent years in several states, because he said he believes he's a 'hunted man.' In one of those states, he says, his car was fitted with an explosive device. In July 1979, a plane was to carry a team of reporters of the Baltimore Sun to Dallas, where they were to rendezvous with Livingstone. The plane was accidentally rammed by a jet fuel delivery truck on the airport apron. Livingstone says this was no accident. The incident caused the occupants to be confined in the plane for three hours, but what is stranger is that neither the newspaper or Livingstone could locate the investigative team for two days. In July and November 1979, the Baltimore Sun published two stories, containing purported new information and a lot of speculation, which Livingstone claims to have stimulated. 'But nobody read it...the wire services probably didn't pick it up, and one of the stories ran on a Sunday features page,' Livingstone said. Livingstone is convinced that some of the government's official autopsy photographs have been forged by an employee of the Central Intelligence Agency so they would be consistent with the so-called 'single-bullet, single-gunman' theory. Livingstone said that on July 30, 1979, he traveled to Dallas where he interviewed various physicians who attended the dying president at Parkland Hospital. In tape-recorded and transcribed interviews, Livingstone said, medical doctors Adolph Giesecke, Robert McClelland, Malcolm Perry, Charles Baxter, Fouad Bashour, Jacqueline Hunt, and Marion Jenkins, indicate that the official government photo shown them may have been fake, because it shows an entrance wound in the occipital-parietal section of the president's head. Livingstone says they all told him that when the president was wheeled into Parkland's emergency room for initial medical treatment, the wound they saw in the back of his head looked like an exit wound...Robert Groden of Hopelawn, N.J., a photographic consultant to the House Assassinations Committee, said 'My visual inspection of the autopsy photos and X-rays reveals evidence of forgery in four of the photographs...'"*

The article then proceeded to quote Jack White on the possibility the photos had been faked, and Dr. Cyril Wecht on the probability there was more than one shooter. It then reported: *"On the other hand, Dr. Paul C. Peters, professor and chairman of the Division of Urology, University of Texas Health Science Center at Dallas, told the NEWS that he has never seen any of the official government autopsy*

photos. He was one of the many doctors and nurses who tried to revive the dying President 17 years ago. But after studying the forensic observations of Dr. John Lattimer, a retired Columbia professor, he believes that the gaping hole he saw in the right rear of the felled President's head should not be considered a true exit wound, but a 'tangential' wound, caused by a shallow bullet entry at the back of his neck."

Well, where do we begin? Hmmm... Livingstone had either presented himself, or had allowed himself to be presented, as a man on the run from dark forces--all because he had copies of the autopsy photos. He then hid that he'd received these copies from Robert Groden, by claiming he'd gotten them from some mysterious figure in the Pentagon. This allowed, as well, for Groden to serve as an additional source for the reporter. Well, this was pretty sneaky, no? And then there's the matter of Peters, who was not listed as one of Livingstone's interviewees, but nevertheless ended up getting called by Williams, only to shoot down the possibility the Parkland doctors' disagreement with the photos suggests a second shooter, by claiming single-assassin theorist Dr. John Lattimer had convinced him otherwise. Pretty wacky.

And from there it only got wackier. By June of 1981, Livingstone had convinced Ben Bradlee, Jr. of the Boston Globe to pick up where he'd left off, and interview the Parkland witnesses for himself. Bradlee's summary of these interviews can be found in the Weisberg Archives. They reveal that Bradlee focused on the recollections of 16 witnesses, and that 8 of the 14 he interviewed for the story cast doubt on the authenticity of the photos, and 6 largely supported their authenticity. This was a journalist at work, and not a theorist. And he believed barely more than half the witnesses suggested the photos were at odds with the wounds. This was far from the ALL claimed by Livingstone.

The witnesses Bradlee thought disagreed with the official description of the head wound were:

1. Dr. Robert McClelland, who is reported to have claimed that the drawing he approved for book publication is still how he *"vividly remembers"* the wound appearing.
2. Dr. Richard Dulany, who is reported to have *"told the Globe that he recalled seeing a wound four to six inches in diameter squarely in the back of the head, in a location quite distinct from that depicted in the official autopsy report and photograph."*
3. Patricia Gustafson, who repeated what she'd earlier told Livingston, that the wound she'd observed was at the *"back of the head."*
4. Doris M. Nelson, who *"drew an illustration of the head wound that placed it high on the back, right side. The wound she drew was in the parietal area, but it extended well toward the rear of the head and appears to conflict with the autopsy photograph. Shown the tracing of that photo, Nelson immediately said: 'It isn't true.' Specifically, she objected to the photograph showing hair in the back of the head. 'There was no hair,' she said. 'There wasn't even hair back there. It was blown away. All that area was blown out.'"* (Note: Bradlee was more specific than Livingstone regarding Nelson's recollections, and reveals that, while disputing the accuracy of the autopsy photos, she nevertheless felt the wound was at the top of Kennedy's head, and not on the far back of the head, where Livingstone and others placed the wound.)
5. Margaret Hood, who *"sketched a gaping hole in the occipital region which extended only slightly into the parietal area."*
6. Dr. Ronald Jones, who *"refused to make a drawing of the wound on a plastic skull model, saying he never had an opportunity to define the wound's margins. With his finger, however, he outlined the wound as being in the very rear of the head. He said the official autopsy photograph of the back of the head did not square with his recollection, but that the McClelland drawing was 'close.'"* (Well, this is interesting. Jones clearly saw where this was headed, and

tried to make clear that his recollection wasn't worth all that much.)

7. Dr. Paul Peters, who *"made a drawing that appeared to place the head wound entirely in the parietal region, but he insisted that he meant for it to overlap into the occipital region as well. 'I think occipital-parietal describes it pretty well,' he remarked. He said he had a good opportunity to examine the head wound. Shown the official tracing of the autopsy photograph, Peters remarked: 'I don't think it's consistent with what I saw.' Of the McClelland drawing, Peters said: 'It's not too far off. It's a little bit (too far) down in the occipital area, is what I would say...But it's not too bad. It's a large wound, and that's what we saw at the time.'"* (Well, this is also quite intriguing. Peters placed the wound in the parietal area, but, one can only presume, recalled Clark's description of it as occipito-parietal, and thought better of it. Note also that two of the witnesses disputing the accuracy of the autopsy photos--Nelson and Peters--had disputed the accuracy of the McClelland drawing as well.)
8. Diana H. Bowron: A British registered nurse. Bradlee couldn't find her but quoted her testimony before the Warren Commission.
9. Dr. William Kemp Clark. Clark refused to be interviewed but Bradlee quoted his previous reports and testimony.
10. Dr. Gene C. Akin, who *"at first recalled that the head wound was 'more parietal than occipital'" but who equivocated after being shown the McClelland drawing, and said "Well, in my judgment at the time, what I saw was more parietal. But on the basis of this sketch, if this is what Bob McClelland saw, then it's more occipital."* (Holy smokes. This confirms that at least one back of the head witness deferred to the accuracy of McClelland's drawing, without realizing the drawing had not been made by McClelland, and without the foresight to realize McClelland himself would come to dispute its accuracy. There's also this. Of the 8 witnesses disputing the accuracy of the autopsy photos, three--Nelson, Peters, and Akin--also initially disputed the accuracy of the McClelland drawing.)

This, then brings us to the six witnesses Bradlee spoke to who *"tended to agree with the official description of the head wound that emerged from the autopsy and Warren Report."*

1. Dr. Charles Baxter, who, despite his earlier statements and testimony, drew *"a large wound in the parietal region"* on a model skull, and *"said the official autopsy photo of the back of the head did not conflict with his memory."*
2. Dr. Adolph Giesecke, who *"placed the head wound in the right parietal region, saying it extended about three or four centimeters into the occiput. Though this would appear to make the wound visible in a rear-view photo, Giesecke said the official autopsy photograph was nonetheless 'very compatible' with what he remembered. He explained this by saying that in the photograph it appeared to him that a flap of scalp blown loose by a billet was being held in such a way as to cover the rear-most portion of the skull wound. Giesecke said the McClelland drawing did not reflect what he remembered of the wound."* (So Giesecke was being reasonable; the photo didn't reflect exactly what he remembered but it was close enough for him to assume it was legitimate. Meanwhile, he totally dismissed the McClelland drawing.)
3. Dr. Charles Carrico, who was not interviewed, but answered questions by letter, and said in his first letter *"that the official autopsy photograph showed 'nothing incompatible' with what he remembered of the back of the head. But he conceded that 'we never saw, and did not look for, any posterior wound.' In his second letter, Carrico said he agreed with the size of the wound shown in the McClelland drawing, but not its location, since '...we were able to see the majority, if not all of this wound, with the patient laying on his back in a hospital gurney.'"*
4. Dr. Malcolm Perry, who, like Carrico, declined to be interviewed, but responded by letter. *"In the first letter, Perry said that while he gave only a 'cursory glance at the head wound...not*

sufficient for accurate descriptions,' the autopsy photograph 'seems to be consistent with what I saw.' In his second letter, Perry simply-reiterated that he had not made a careful examination of the head wound. and that in his opinion, the only person qualified to give a good description of the wound was Dr. Clark."

5. Dr. Marion T. Jenkins, whose earlier claims he'd observed cerebellum had been widely quoted *"told The Globe he had been mistaken in his statements on this. 'I thought it was cerebellum, but I didn't examine it,' he said. Jenkins refused to draw a picture of the head wound on a plastic skull model, insisting instead that a reporter play the part of the supine Kennedy so he could demonstrate what he saw and did. Asked to locate the large head wound, Jenkins pointed to the parietal area above the right ear. He said he had never looked at the back of the head."*
6. Dr. Robert G. Grossman, who *"said he took up a position next to Dr. Clark at the right of Kennedy's head. In contrast to Jenkins, Grossman said the president's head was picked up by Clark. 'It was clear to me that the right parietal bone had been lifted up by a bullet which had exited,' Grossman said. Besides this large parietal wound, Grossman went on to say that he had noted another separate wound. measuring about one—and—a-quarter inches in diameter, located squarely in the occiput. Grossman was the only doctor interviewed who made such a reference to two distinct wounds. Though no occipital wound such as he described is apparent in the official autopsy photograph, Grossman nevertheless said 'it seems consistent' with what he remembered. He said the large wound depicted in the McClelland drawing 'is in the wrong place.'"*

Let's reflect. Ben Bradlee and the Boston Globe interviewed 14 Parkland witnesses in 1981. Of these 14, 8 strongly questioned or rejected the accuracy of the autopsy photo showing the back of Kennedy's head, and 6 supported or failed to question the accuracy of the photo. This is indeed interesting. But what's just as interesting, and just as telling in the long run, is that NINE of these 14 rejected the accuracy of the McClelland drawing, which those focusing on this issue nevertheless propped up as a depiction of the one true wound.

Feel free to scream. And let's reflect that when ultimately reporting on these interviews, in his 1989 best seller *High Treason*, Livingstone and his co-author Robert Groden claimed that the "McClelland" drawing *"was verified by every doctor, nurse, and eyewitness as accurate."*

So, I ask again, were we conned?

I mean, it's not as if Livingstone didn't know these witnesses had discounted his theory. Here is Bradlee's 6-21-81 article on the head wounds:

INVESTIGATIONS

Dispute on JFK assassination evidence persists

Eighteen years later, Dallas medical team disagrees: where was the President's mortal head wound?

***By Ben Bradlee
Globe Staff***

DALLAS — Burled in the mounds of books, official reports and investigative files on the assassination of John F. Kennedy on Nov. 22, 1963, is a dispute about the medical evidence that has never been resolved. The crux of the issue is the precise location of the gaping head wound which all concerned acknowledge that the President sustained.

The gaping head wound was seen by at least 12 doctors and four nurses who treated Kennedy at Parkland Memorial Hospital here minutes after he was shot. Fourteen of the 16 were interviewed recently by The Globe. Eight of those said that an official tracing of an autopsy photograph of the back of the President's head does not show the wound as they recall it.

What significance the dispute plays in unraveling the puzzle of the Kennedy assassination is uncertain: If the recollections of these doctors and nurses are correct, it could ultimately mean that the Warren Commission was wrong in its conclusion that Kennedy was shot from the rear by a single gunman; or, it could be simply an indication that the doctors and nurses were wrong about what they think they saw.

Eleven of the doctors and three of the nurses (none of whom has seen the actual Kennedy autopsy photographs) were shown the tracing of the most pertinent autopsy photo. which was prepared for the House Select Committee on Assassinations and published in its final report in 1979.

A 12th doctor who treated the late President refused to be interviewed and a fourth nurse could not be reached by The Globe. But both are on record as having placed the head wound in an area which is not consistent with the official tracing,

Neither the Warren Commission nor the House Assassinations Committee, which concluded that President Kennedy was "probably" assassinated as part of a conspiracy, attempted to resolve the discrepancies by showing the autopsy photos to the Parkland doctors and nurses. Critics have called this a fundamental flaw in both investigations.

A majority of the doctors and nurses interviewed this year (five of the doctors, three of the nurses) say they recalled seeing a large wound in the right rear of Kennedy's head. The tracing of the autopsy photograph shows what appears to be a flap of bone protruding from the right side of the head but the back of the head shows no gaping wound.

'There's a definite conflict'

"There's a definite conflict," commented Dr. Richard B. Dulany when shown the official tracing. "That's not the way I remember it."

"It's not true." added Doris M. Nelson, nursing supervisor of the Parkland emergency room the day of the assassination, when she examined the official tracing. "There wasn't even hair (in the back of the head) ... it was blown away. All that area was blown out."

In testimony before the Warren Commission or in earlier written reports. all the Dallas doctors and nurses who made specific reference to the location of the head wound either said it was squarely in the occipital area (back of the head) or that it extended from the right parietal area (side of the head) into the occiput.

If these doctors were precise in their application of the terms occipital and parietal. Why isn't such a wound visible in the autopsy photograph taken of the back of the head?

One possible explanation is that the doctors and nurses, considering that they were more concerned with saving Kennedy's life than observing his wounds, were mistaken in their

observations, or were imprecise in describing what they saw. However, the Dallas doctors and nurses who dispute the accuracy of the official tracing told The Globe they are firm in their recollections.

Critics of official investigations into the Kennedy assassination have advanced two other possible explanations: 1) that the photo in question has been doctored to eliminate evidence of a gaping exit wound in the back of the head to make the evidence conform to the official theory that Kennedy was shot from the rear by Lee Harvey Oswald, acting alone; or 2) that the President's head wounds were surgically altered before his body arrived at Bethesda Naval Hospital in Maryland for autopsy.

NOTE ON SOURCES

The autopsy and its failures have been discussed in books and articles such critics as Edward Epstein, Harold Weisberg, Sylvia Meagher, Vincent Salandria and Cyril Wecht.

Harrison Livingstone, a Baltimore researcher, first showed the official tracing of the autopsy photograph of the back of President Kennedy's head to several of the Dallas doctors, and elicited doubts from them as to the tracing's accuracy.

Kennedy is officially said to have sustained two wounds: one which entered in the lower back of his neck and exited at his throat, and one which entered the back of his head and exited at the right side of his head, creating a gaping wound. The most detailed description of the large head wound given the Warren Commission was furnished by Dr. Robert N. McClelland, a surgeon who treated Kennedy in the Parkland emergency room. But McClelland put this large defect in the back of the head, not the side.

McClelland told the Warren panel he stood at the head of the operating table and thus was in "such a position that could very closely examine the head wound, and I noted that the right posterior portion of the skull had been extremely blasted. It had been shattered, apparently, by the force of the shot so that the parietal bone was protruded up through the scalp and seemed to be fractured along its right posterior half, as well as the occipital bone being fractured in its lateral half, and this sprung open the bones that I mentioned in such a way that you could actually look down into the skull cavity itself and see that probably a third or so, at least, of the brain tissue, posterior cerebral tissue and some of the cerebellar tissue, had been blasted out."

Left: The official tracing commissioned by the House Assassinations Committee of a photo taken of the rear of President Kennedy's head during his autopsy. Flap of bone protrudes at right, but no gaping wound can be seen. Arrow (added by Globe) shows a small entrance wound in the cowlick area, about four inches higher and to the left of where the autopsy doctors located it in their report.

Right: A drawing representing the location of Kennedy's gaping head wound as described by Dr. Robert N. McClelland, one of the Dallas doctors who treated him. A majority of those doctors and nurses attending Kennedy who were in a position to see the head wound agree with McClelland and dispute the official tracing.

Controversial artist's drawing

One of the many amateur investigators of the assassination who has published a book about the event, Josiah Thompson, a former professor of philosophy at Haverford College, commissioned an artist to prepare a drawing based on the McClelland description. The drawing, approved by McClelland prior to its publication in the book, depicts a fist-sized wound with edges scored out in the lower right rear of the head.

McClelland reaffirmed in a recent telephone interview that the drawing was what he "vividly remembers" the head wound looking like.

Some Warren Commission critics and other researchers have erroneously cited this drawing as representing the Dallas doctors' and nurses' sole view of the head wound.

Actually, according to Globe interviews, they are not unanimous in their opinions or recollections. Five of the doctors and nurses agree with McClelland on the drawing and strongly assert that the wound was in the back of the head; four other doctors say that the tracing of the autopsy photograph shown them by The Globe is "consistent" with their recollection of the head wound.

Two doctors lean toward this official view, while five others tend toward the McClelland view that the wound was in the rear of the head, but fall short of giving it a blanket endorsement.

Of the six doctors who said that they agree or tend to agree with the official tracing showing no gaping wound extending into the occipital region, five have, at one time or another, gone on record as saying that the wound did extend into the occiput.

For example. Dr. Charles J. Carrico, the first physician to treat Kennedy, testified twice before the Warren Commission, first describing the head wound as "a large, gaping wound located in the right, occipital-parietal area," and then as a "five by (seven) cm. defect in the posterior skull, the occipital region ..." Carrico was not interviewed by The Globe, but in a letter sent in response to questions, he said the official tracing of the autopsy photograph showed "nothing incompatible" with what he remembered of the back of the head.

The sixth doctor supportive of the official tracing, Dr. Robert G. Grossman, now a professor and chairman of the department of neurosurgery at the Baylor College of Medicine in Houston, was working next to the senior neurosurgeon present, Dr. Kemp Clark, at Kennedy's head. Grossman told The Globe that he observed two separate wounds: a large defect in the parietal area above the right ear, and a second wound, about one-and-a-quarter inches in diameter, located squarely in the occiput. Grossman, the only physician to report seeing two such distinct wounds, was never called to testify before the Warren Commission or the House Assassinations Committee. Nor were Dr. Dulany or Nurse Patricia Gustafson, one of those who said that Kennedy's gaping wound was in the back of his head.

Disagreement on wound's visibility

In interviews, some doctors doubted the extent to which a wound to the rear of the head would have been visible since the President was lying supine with the back of his head on a hospital emergency cart.

But others, like Dulany and Grossman, said the head at some point was lifted up, thereby exposing the rear wound. Added Gustafson: "One of the doctors asked me to put a pressure bandage on the head wound and I tried to do so. (but) there was really nothing to put a pressure bandage on. It was too massive. So he told me just to leave it be." The wound, she said, was in "the back of the head."

"Definitely in the back?" she was asked.

"Yes," she said.

To critics of the official investigations, it is inconceivable that the presumably skilled Dallas doctors, conversant with anatomical terms, would consistently misuse words like "cerebellum" and "occipital" and say that the wound extended into the back of the head if, in fact, it did not.

But speaking to the occipital question, Grossman, a neurosurgeon, suggested that part of the confusion surrounding the location of the head wound could be the result of the imprecision with which the term "occipital" is used, While the occiput refers specifically to a bone in the lower back section of the head, Grossman said many doctors loosely use the term to refer to "the back fifth of the head ... There is this ambiguity about what constitutes the occipital and parietal area ... It's very imprecise."

Until now, to critics, the most plausible explanation for the discrepancy between the Dallas

observations and the autopsy photograph of the rear of the head was that the photo was a forgery.

Some of the critics, notably the House Assassinations Committee's own photographic consultant, Robert J. Groden of Lodi, N.J., have argued that the failure of the Warren Commission and the House committee to show the autopsy photographs to the Parkland doctors and nurses cast doubt on the House committee's conclusion that the photos were authentic. The question of authenticity was not addressed by the Warren panel.

In a little-noticed dissent published in one of the appendices to the House committee report, Groden, who did the original optical enhancement work of Abraham Zapruder's now-famous home movie of the assassination, asserted that four of the autopsy photographs (two in color, two in black and white) showing a similar view of the back of the President's head had been altered to eliminate evidence of a gaping hole in the back of the head.

Based on the recent doubts voiced by most of the Dallas doctors and nurses, The Globe last month received permission from the Kennedy family to view the autopsy photographs at the National Archives in Washington. This was done with the aid of three independent photo-optics experts to determine the validity of Groden's allegations.

All of the photo consultants concluded that the photographs were authentic. (See accompanying article).

Author David Litton, in his new book, "Best Evidence," published by Macmillan, advances a different, far more radical explanation for the discrepancies between the observations of the Dallas doctors and the autopsy photographs: that between the time Kennedy's body left Dallas and the time it arrived in the autopsy room at the Bethesda Naval Hospital in Maryland some six hours later, the wounds on the corpse were surgically altered to change the evidence concerning the number and direction of shots, as part of a plot to support the single-assassin theory.

Lifton cites an FBI report prepared by two agents who attended the autopsy. James Sibert and Francis O'Neill. The report, declassified and released years after the Warren report was published, states that "... it was also apparent that a tracheotomy had been performed, as well as surgery of the head area, namely in the top of the skull." No surgery other than the tracheotomy was performed by the Dallas doctors. In subsequent memoranda. Sibert explained that his statement was based on remarks made at the time by the lead autopsist, Dr. James J. Humes.

The 700-page book, whose thesis Lifton himself admits strains the imagination, is nonetheless a thoroughly researched account based largely on public documents and buttressed by new evidence in the form of statements from several Bethesda hospital technicians and military bystanders who were eyewitnesses to the movements of Kennedy's body.

Concerned that some of these witnesses might later retract what they told him. Lifton recorded their statements on videotape which has been viewed by The Globe. Lifton said he was moved to interview the Bethesda attendants after reading a statement in one of the volumes of the House Assassinations Committee report issued in 1979, saying that Kennedy's body had arrived at Bethesda in a body bag. This conflicted with the testimony of many witnesses who told the Warren Commission the body left Dallas wrapped in sheets.

Lifton located witnesses who told him that Kennedy's body first arrived at Bethesda in a plain gray

shipping casket, not the bronze casket it left Dallas in, and that the body was inside a zippered body bag.

In a telephone interview, retired Brig. Gen. Godfrey McHugh. President Kennedy's Air Force aide who said he was with the President's casket for all but five minutes or so that day, castigated Lifton's book as "absolutely absurd. It's full of lies and false implications." When he wasn't with the casket, McHugh said, Mrs. Kennedy, aides or the Secret Service always were. He said he saw the President's body taken out of the bronze casket inside the Bethesda morgue, but he conceded he could not attest to the fact that the body was inside that casket from the time it left Parkland Hospital until it reached the morgue.

Besides photo forgery, rejected by The Globe panel, and the more radical Lifton thesis of surgical alteration, there is a third, quite innocent, possibility advanced by some, including the House Assassinations Committee. as an explanation for the discrepancies between the Dallas and Bethesda observations: that the Parkland physicians, concerned chiefly with trying to save Kennedy's life rather than observe his wounds, simply were mistaken In what they saw.

A variation of the mistaken hypothesis is that, as Dr. Grossman suggested, the Dallas doctors erroneously described the head wound. The autopsy photograph of the right side of Kennedy's head, seen by The Globe at the National Archives but not shown to the Dallas doctors, depicts a massive wound which extends about two inches behind the ear toward the back of the head. It is possible, according to Grossman, that the doctors loosely used the word "occipital" in describing a wound that extended to the back fifth of the head, or that they assumed, without lifting up the head, that the defect did reach the back.

Whatever the answer, it is likely that few will be satisfied, and that The Globe's Dallas interviews add up to another mysterious footnote to the Kennedy legacy.

The Blame Game

Well, Bradlee's article was quite fair, wouldn't you say? It described the controversy without taking sides. Still, that wasn't good enough for Livingstone.

Here is the bulk of a press release (found in the Weisberg Archives) prepared by Livingstone on June 27 1981, attacking Bradlee's June 21, 1981 article:

"I, Harrison E. Livingstone, mentioned in the article as first interviewing the Parkland doctors concerning the autopsy photos, motivated the Globe and prepared them for their 'investigation", during which time I was severely mistreated by them. The Globe claims that the majority of doctors and nurses whom they interviewed disputed the autopsy photos. (as did the autopsists themselves 7 HSAC), but that some doctors say that the photo is consistent with the wounds as they recall them. This is doubtful or not true. The Globe has perhaps-one witness of the 14 they interviewed that might positively say this. The Globe has not documented their work, not named the doctors whom they claim support the picture. The reason is that we proved that the doctors did not tell the Globe this, but that the Globe in an excess of zeal tried to get each witness to change what they said to the Globe, to the Sun previously, and to me. Previously, 100% of all witnesses interviewed by the Sun and myself said the pictures did not show the wound as they recall them. Both myself and Sun reporters have re-interviewed some of the

Globe witnesses whom the Globe said agree with the pictures and find that this is simply not true. One of the doctors whom the Globe counted as reversing his testimony to me, then wrote me after the Globe visited him, and repeated what he told me, that the large gaping hole in the back of the head extended into the occipital area. My original tapes of him and the other doctors are in the JFK Library. The Globe attempted to tell people that what I said was on the tapes was not on them, but then discovered that the Sun and the Library and others have these tapes and that they are valid and unassailable. Nevertheless, the Globe counted among their negative witnesses several of mine. Why they have fabricated evidence in this case, I do not know. I am sorry I went to them. It has taken me two years to try to establish this major evidence in this case. It was clear to me from an early stage that the Globe's intent was to either destroy my evidence, and Bob Groden's claim that the pictures are forged, or water it down. They could only water it down by the use of fraud. The doctors and nurses made no mistake as to the wounds. The nurses had plenty of time to study the body as they washed it."

Livingstone then added: *"I ask that the above not be printed until I have completed certain work. The Globe has promised to allow me to listen to all of their tapes, and state that they will be placed in the JFK Library soon. I forced them to do this. I have also been able to trap these papers into doing some sort of an investigation. The Baltimore Sun has major evidence in the case, has in fact had access to the autopsy photos in 1979, as they admitted in an article Nov 18, 1979 by Steve Parks, and the Globe knows this and has talked to Parks. Why have they lied about so much? The Sun is working on the case now, and does not like both the Globe's fabrications and private accusations that the Sun has lied about the testimony it took, which both Groden and I are familiar with."*

Well, this is pretty clear. Livingstone felt Bradlee had burned him, and had picked up his story in order to water it down, or destroy it. What he needed to do, then, in order to prove Bradlee incorrect in claiming nine witnesses rejected the accuracy of the McClelland drawing, was listen to Bradlee's tapes, and show where Bradlee had turned some of these witnesses against him, and misrepresented what they had said about the McClelland drawing.

He would have to do as much, or something equally dramatic, before he could possibly claim every doctor had verified the accuracy of the McClelland drawing, correct?

Circumnavigating the Globe

Wrong. Let's explore then how Livingstone handles Bradlee's 1981 interviews in *High Treason*, co-authored by Robert Groden, and published in 1989... In a footnote on Bradlee's article, he relates *"I am grateful for the work that the Globe people contributed to this investigation, and for turning it over to me. I earned it."*

Hubba..whaa? Did Livingstone forget how their work helped undercut his own?

Or had he decided to just ignore the interviews they'd obtained that ran counter to his thesis?

Neither, actually. In *High Treason*, it was advanced that *"Livingstone, The Baltimore Sun, and Ben Bradlee, Jr. of The Boston Globe have compiled the testimony of a number of additional witnesses, and the startling conclusion of their work is clear: the autopsy pictures are fake"* and that, furthermore, *"upon seeing the official government autopsy photograph of the back of the head for the first time, each witness independently denounced it."*

Well, heck, that's quite a statement, particularly in that Bradlee thought the evidence inconclusive, and

far from "clear." So what was Livingstone up to?

Apparently, a good old-fashioned whitewash...

Here's how he explained the Globe's failure to replicate his results... He offered *"Just prior to Ben Bradlee's Boston Globe trip to Dallas, the evidence he was about to gather was subject to a powerful negative influence, which changed the results he might otherwise have collected. A book was published by David Lifton--Best Evidence--which revolved around the question we are dealing with in this book: why the alleged autopsy photograph does not show the wounds as they were described by all of the witnesses. In addition to the theory it propounded, the book gave the erroneous impression that there was a flap of scalp on the President's head which covered up the large hole in the back. This book promptly became a best-seller for five months. The flap of scalp story convinced some of the doctors co-author Livingstone and The Baltimore Sun had interviewed to change their feelings about the picture..."*

Yes, you read that right. Rather than acknowledge the obvious--that the Parkland witnesses were not in total agreement--Livingstone claimed David Lifton had convinced *"some of the doctors"* that the hole they'd seen was covered up by a flap by the time of the autopsy, and that the autopsy photos were therefore authentic, but misleading. Well, this avoids the inconvenient truth these witnesses not only said the photos looked legit, but also said the McClelland drawing was inaccurate.

I mean, really... As if these doctors would have claimed the photos were fake if that spoil-sport Lifton hadn't convinced them otherwise... This is silly in the extreme... There's no evidence any of the doctors interviewed by the Globe ever subscribed to Lifton's theory, or looked to him for guidance when interpreting the autopsy photos...

Feel free to laugh...

And observe how Livingstone further dispenses with the Globe's article in High Treason...and scream...

(His words in bold.)

"On June 21, 1981, the Globe published an article based on taped testimony basically corroborating the authors' findings. It appears that the Globe editors attempted to water down this powerful evidence, discrediting the secret autopsy pictures by quantifying their results on a scale of 1 to 10. They had to literally change--or loosely interpret--the testimony of some witnesses. Although the Globe found overwhelming evidence that the pictures are false, the evidence they claim supports the autopsy photographs appears very weak when we realize that all the doctors they cite as-Supporting the picture had previously denounced it.

Ben Bradlee, Jr. wrote co-author Livingstone, "Dear Harry: Here is the story as it appeared yesterday. It is not as I wanted it, as the enclosed copies of my original drafts will attest. There was so much haggling over the piece, however. I was glad just to be done with it and get it in the paper. Note your acknowledgement at bottom left. Thanks for the book. Best regards, Ben."

Of all the many witnesses, the Globe counted four who they felt supported the picture. Three of the four had made strong statements denouncing the picture at one time.

(Note: it wasn't four; it was six.)

The Globe wrongly interpreted the data on doctors Giesecke, Jenkins, Perry, and Carrico, for they all had been led to believe--after their interviews with the author and the Sun-- that there was a flap of scalp on the back of the head which was pulled down to show an alleged entry wound. We have already seen that the autopsists hotly denied that there had been an entry wound in that region, and they said, like many other Dallas witnesses, that there was no scalp there to be pulled down, Lifton's theory notwithstanding.

(So, Livingstone had decided to ignore Baxter and Grossman... His failure to acknowledge their statements supporting the photo to The Globe is indeed suspicious. Baxter's Warren Commission testimony described a "*temporal parietal plate of bone laid outward to the side*" and he told The Globe the tracing of the autopsy photo "*did not conflict with his memory.*" And yet, in his 1981 article describing his interview with Baxter, Livingstone had at first misrepresented Baxter's testimony before the Warren Commission, claiming he'd told them "*There was a large, gaping wound in the back of the skull,*" when he'd actually said "*There was a large gaping wound in the skull,*" and then claiming he "*questioned*" the photos. Elsewhere in High Treason, Livingstone claimed that when he interviewed Baxter in 1979, Baxter told him that "*without question the back of the head was blown away*" (his interpretation of Baxter's words), and that Baxter had actually said "*It was a large gaping wound in the occipital area.*" Well, hold it right there. Livingstone's article on his 1979 interviews reported merely that Baxter had "*questioned the autopsy photos,*" and not that he'd said the wound was in the occipital area--which would have been a change from his Warren Commission testimony. It seems likely then that Livingstone was lying and trying to hide that Baxter was not a "back of the head" witness--I mean, why not admit that Baxter had told The Globe the photo didn't conflict with his memory? As for Grossman, well, he said that the large wound of exit was in the parietal area--where it is depicted in the autopsy photos. This was, of course, most inconvenient for Livingstone and Groden's position this wound was low on the back of Kennedy's head.)

Dr. Giesecke confirmed to The Globe that the back of the head was missing, but he had been told--after Livingstone had spoken to him and before The Globe's visit--about the alleged flap of scalp. The Globe erroneously interpreted this as meaning that he no longer felt there was a large hole in the back of the head. Trying to explain this, Dr. Giesecke later wrote co-author Livingstone: "in doing so (pulling down the flap), the underlying bony defect is obscured," making clear that the large hole was still there.

(This hides that Giesecke placed the wound at the top of the back of the head, and not low on the back of the head where Livingstone claimed it was, and that Giesecke had told The Globe the McClelland drawing was inaccurate.)

The Boston Globe completely ignored the evidence co-author Livingstone had obtained from Dr. Jenkins, and claimed that the doctor agreed with the autopsy photographs (without being shown them by the Globe). Dr. Jenkins is not quoted or mentioned in the Globe article, but the following statement is used by him to discredit what Jenkins had said before: "I thought it was cerebellum, but I didn't examine it." They wrote in their notes that he was therefore mistaken in his statements concerning the hole in the back of the head, and they presumed that he had never looked at the back of the head. It was this, and only this, that the Globe used in their rejection of Jenkins' clear position that the large hole was above and posterior to the right ear, which he in fact pointed out to Bradlee, whom he made lie down for the demonstration.

The House Assassinations Committee interviewed Dr. Jenkins in November 1977. He told the

investigator that he "was the only one who knew the extent of the head wound." "His location was customary for an anesthesiologist. He was positioned at the head of the table so that he had one of the closest views of the head wound. Regarding the head wound, Dr. Jenkins said that only one segment of bone was blown-out--it was a segment of occipital or temporal bone. He noted that a portion of the (lower rear brain) cerebellum was hanging out from a hole in the right--rear of the head." They did not show him the autopsy photographs.

(This was a bit silly. Why would any paper accept "the evidence" obtained by someone else, while working for another paper, and ignore their own interviews? Jenkins said he didn't see cerebellum, and that he'd never looked at the back of Kennedy's head. That was a retraction from his earlier statements, and confirmed that he'd rejected the accuracy of the McClelland drawing. If he'd pointed to a spot on the parietal bone slightly behind Kennedy's ear, when the wound in the photos was slightly in front of Kennedy's ear, it was of little matter. Livingstone could no longer claim him as a "back of the head witness." And his attempt at keeping him in the flock reeks of desperation.)

The Sun published the fact that Dr. Malcolm Perry hotly denounced the picture, but The Globe, although they did not interview him, said that he supported the autopsy photograph. They did not print the denial or any reference to this doctor. In any event, The Sun's intensive interview with Dr. Perry was conducted in front of witnesses, and the results corroborated the testimony of every other witness who had been interviewed up to that time.

The Assassinations Committee interviewed Dr. Perry in 1978, but did not show him the autopsy photographs. Perry told the interviewer that he had looked at the head wound and that it "was located in the 'occipital parietal' region of the skull and that the right posterior aspect of the skull was missing." It does not make sense that Dr. Perry and the only other two Parkland doctors (Jenkins and Carrico) the Committee interviewed would have somehow changed their observation that the back of the head was missing for the Boston Globe.

In addition, the testimony of Dr. Perry to the Warren Commission, and his extensive first-hand experience with the wounds, makes any later retraction attributed to him not credible.

(This was equally silly. Livingstone asserts that Perry's retraction can be ignored because he--Livingstone--finds it not credible. Perry was Kennedy's main physician at Parkland, and Livingstone's claims we can dismiss his most recent recollections on the wounds are nonsense.)

The fourth witness, Dr. Carrico, made such contradictory statements to the Globe that it would be inaccurate to count him as supporting the picture. Dr. Carrico told the Warren Commission: "The wound that I saw was a large gaping wound, located in the right occipitoparietal area. I would estimate it to be about 5 to 7 cm. in size, more or less' circular, with avulsions of the calvarium and scalp tissue. As I stated before, I believe there was shredded macerated cerebral and cerebellar tissues both in the wounds and on the fragments of the skull attached to the dura.""

When interviewed in January 1978 by the House Assassinations Committee, Dr. Carrico repeated the same thing: "The other wound was a fairly large wound in the parietal, occipital area. One could see blood and brains, both cerebellum and cerebrum fragments in that wound....The head wound was a much larger wound than the neck wound. It was five by seven centimeters, something like that, 2 1/2 by 3 inches, ragged, had blood and hair all around it, located in the part of the parietal occipital region...above and posterior to the ear, almost from the crown of the head," that is, just where the small entry wound shows in the alleged autopsy photograph. It would have been

impossible for this to be true without showing on the photograph.

Dr. Carrico was not interviewed by the Globe, but he wrote them two contradictory letters. In nearly all other cases, the witnesses have just as clear a picture of the events of November 22, 1963 today in 1988 as they did then.

(Livingstone thereby demonstrates his lack of understanding of a topic he really should have studied: the reliability of eyewitness testimony. In reality, the clarity of the picture has almost nothing to do with the accuracy of the picture.)

The first spontaneous, emotional response of a witness is the most credible. In legal terms, such evidence bears the indicia of truth and reliability, before the witness has a chance to be subjected to conflicting influences and pressures, and/or reflect on his own self-interest. Eyewitnesses can be very wrong, depending on the circumstances, but the medical witnesses at Parkland, the President's wife--who held his head in her lap--and other officials and agents present in Dallas cannot all be wrong.

(More nonsense. Mrs. Kennedy's statements did not suggest a wound on the far back of her husband's head. And the part about emotional responses being the most credible--is GARBAGE!)

Dr. Robert Grossman, now a Professor and Chairman of the Department of Neurosurgery at the Baylor College of Medicine in Houston, had just joined the staff at Parkland at the time of the assassination as an Instructor in Neurosurgery. He never testified to the Warren Commission or to the Assassinations Committee. He said that he saw two large holes in the head, as he told The Globe, and he described a large hole squarely in the occiput, 'far too large for a bullet entry wound, which would have shown in the disputed picture. It does not.

(Seriously? Grossman said the large hole was at the top of Kennedy's head, exactly where it is shown in the autopsy photos. Livingstone and Groden's pretending the entrance wound he claimed to see on the back of Kennedy's head was the same wound described by others, and proof the photos are fake, is deceptive, to say the least.)

Since the Globe did not take into account the previous testimony taken by Livingstone and the Baltimore Sun, it would seem that by their own standards, any testimony or position on the issue of the validity or lack of validity of the autopsy photographs should be discounted--especially if they did not actually speak to the witness. The Globe and Ben Bradlee, Jr. had no contact whatsoever with Dr. Kemp Clark or Nurse Diana Bowron, yet the Globe placed them on their chart ranking as 9s on a scale of 1 to 10, ten meaning total disagreement with the autopsy photographs.

(This is a bit bizarre. He's attacking the Globe for doing exactly what he did in his article for the Sun--including the statements and testimony of witnesses before the Warren Commission that SUPPORT the possibility there was a large wound on the back of the head. And his description of the interviews he'd conducted for The Sun as "testimony" is both self-serving and deceptive.)

Dr. David Stewart wrote Livingstone on DeCember 11, 1981: "I enjoyed our phone conversation and I appreciate your sending the material. I'll try to answer your questions as well as I can.

"On the Joe Dolan radio show, I meant to indicate that there was no controversy concerning the wounds between the doctors in attendance. I was with them either separately or in groups on many

occasions over a long period of time.

"Concerning exhibit F-48, there is no way the wound described to me by Dr. Perry and others could be the wound shown in this picture. The massive destructive wound could not remotely be pulled together well enough to give a normal contour to the head that is present in this picture." We would have to say that if Dr. Stewart did not actually see the wound, then this is hearsay evidence insofar as what he saw or did not see. What is admissible in evidence here is what he was told by Dr. Perry, the wound described to him.

Dr. Jackie Hunt, like Dr. Bashour, was not interviewed by The Globe, but Livingstone showed her the picture in 1979 and she instantly denounced it. She did not see the back of the head because she was standing directly over the President, but she insisted that the back part of the head was blown out and rejected the official picture. "That's the way it was described to me," she said, saying that the back of the head was gone." Had the large defect been anywhere else, she would have seen it and described it. Dr. Akin said that if you looked directly down on Kennedy, you could not see the large hole." Therefore, Dr. Hunt's testimony is significant.

Dr. Hunt responded to Livingstone's question: "So, the exit wound would be in the occipital-parietal area?" "Yeah, uh-huh. It would be somewhere on the right posterior part of it..." She pointed to the sketch from Six Seconds In Dallas: "That's the way it was described to me." "I went around this way and got the equipment connected and started--but I saw the man's face like so, and I never--the exit wound was on the other side--and what was back there, I don't know. That is the way it was described to me," she said, pointing to the sketch showing the large hole in the back of the head. "I did not see that. I did not see this part of his head. That would have been here," she said, and put the palm of her hand on the back of Livingstone's head. She did this before Livingstone showed her the sketch from Thompson."

(Well, that's a bit deceptive, wouldn't you say? Livingstone included the statements of two witnesses who admitted they'd never seen the wounds they were describing and that what they were saying was hearsay. Well, no one--most certainly not The Globe--disputed that some of the doctors thought the wound was on the back of Kennedy's head, and that others thought that at one time but had now changed their minds. So what was the point in finding a witness to their saying so, beyond skewing the numbers and giving the impression a higher percentage of the doctors thought the wound was on the far back of the head? I mean, REALLY? We're expected to dismiss the most-recent statements of Jenkins, Perry, and Carrico--three doctors who'd actually worked on Kennedy--and accept the second-hand recollections of Stewart and Hunt, who didn't even see his wounds? And speaking of Hunt, let's recall that in his rejected article for The Sun, Livingstone claimed that she didn't "fully endorse" the autopsy photos. Well, no wonder. She hadn't even seen Kennedy's wounds!)

It should be noted, however, that Livingstone is more of a zealot than a snake-oil salesman. In the years since High Treason, to his credit, he has published interviews with witnesses that ran counter to his previous claims. In Killing the Truth (1993), he published the transcript of an interview he'd obtained from long-lost Parkland nurse Diana Bowron, in which she told him Kennedy's head wound was "basically almost the size of a saucer, and sort of from the occiput. So there was quite a reasonable amount missing from the top as well." She then drew a top view of Kennedy's head, which Livingstone also published. It had an area on the right side stretching from above the ear on back marked "missing." Well, this was totally at odds with the "McClelland" drawing Livingstone previously had championed.

It seems likely, in fact, that Livingstone has come to doubt the accuracy of the "McClelland" drawing.

In High Treason 2, published 1992, he cited a 7-21-81 interview of Parkland Nurse Doris Nelson conducted as a response to The Globe's article the month before, in which she firmly rejected both the autopsy photo of the back of Kennedy's head and the "McClelland" drawing. She told Livingstone: *"All I saw was missing skull and brains on the back of his head right there...There wasn't any bone there where that entry hole shows in the picture."* When then shown the McClelland drawing, she claimed *"It looked like that, but it's too low. It was where the cowlick is in this picture. There was nothing there...The hole in the drawing was too low. It was right there, in the right rear."* Well, heck, this confirmed for Livingstone what she'd previously suggested to Bradlee--that the McClelland drawing was inaccurate.

But it's worse than that. When discussing Nelson's rejection of the McClelland drawing, Livingstone added *"She said the same thing about that drawing which Dr. McClelland had told me."* Oops. Keep in mind that this interview was in 1981 and that High Treason, co-authored by Robert Groden, was not published until 1989. In High Treason, Livingstone (and Groden) claimed Nelson disputed the accuracy of the autopsy photo, but said nothing of her opinion of the McClelland drawing. In it, they claimed McClelland had told the Baltimore Sun and Boston Globe the drawing was *"accurate."* In the photos section of High Treason, moreover, they claimed that the "McClelland" drawing *"was verified by every doctor, nurse, and eyewitness as accurate."* Now here was Livingstone, in 1992, admitting that this claim was untrue, and that at least two of the witnesses he'd interviewed in '79 and '81 had told him the wound in the drawing was too low. It's also of interest, then, that Livingstone's 1981 article on his 1979 interview with McClelland claimed *"Dr. McClelland said that it (the drawing) accurately portrays what he 'vividly remembers' seeing on the operating table after the president was rushed into emergency."* Perhaps, then, Livingstone (and Groden) considered a witness' saying the wound in the McClelland drawing resembled Kennedy's wound a *"verification"* of its accuracy, even if they said it was in the wrong spot.

If so, then, well, this was something they should have told their readers.

The Case For Conspiracy

Dr. Paul Peters in JFK: The Case for Conspiracy, while pointing out Kennedy's head wound location: "Right about there is where I thought the hole was: occipital-parietal"

Dr. Paul Peters in The Killing of a President, p. 87: "...right there, occipital parietal"

Jerrol Custer in JFK: The Case for Conspiracy, while dragging his hand from his forehead all the way back to the base of his skull: "From the top of the head almost back to near the base of the skull, it seemed that that part was gone."

Jerrol Custer in The Killing of a President, p. 88: "From the top of the head, almost to the base of the skull, you could see where that part was gone."

Paul O'Connor in JFK: The Case for Conspiracy, while tracing the outline of a massive wound from front to back on his skull: "(There was) an open area all the way across into the rear of the brain like that."

Paul O'Connor in The Killing of a President, p. 88: "(There was) an open area all the way across into the rear of the brain."

When one watches the interviews of Paul Peters, Jerrol Custer, and Paul O'Connor in Robert Groden's DVD JFK: The Case for Conspiracy, one finds evidence for a most surprising conspiracy—a conspiracy to deceive the readers of Groden's book The Killing of a President, and make them think these men were describing an exit wound low on the back of the head.

The Case For Conspiracy

When one compares the interviews presented in Robert Groden's 1993 video JFK: The Case For Conspiracy with the synopsis of these interviews presented in his 1993 book The Killing of a President, moreover, one can find clear-cut evidence for deception.

In the video, Dr. Paul Peters points out his recollection of the head wound location. As shown on the slide above, it was at the crown of Kennedy's head. So why does Groden, in his book, present a photo of Peters pointing to the far back of his head, barely above his ears? Was Groden pulling a fast one in order to help sell that Peters' recollections were consistent with the proposition the Harper fragment was occipital, and that the "McClelland" drawing was accurate?

If so, then the irony is palpable. David Lifton, in the 2011 forum post cited above, cited Peters' 1966 recollection of looking down into Kennedy's wound and seeing cerebellum as evidence the wound was low on the back of Kennedy's head on the occipital bone, and the Harper fragment was occipital bone. Lifton hates Groden...so much so that he wrote a near-book length article on Groden's deceptions for the 2003 book The Great Zapruder Film Hoax.. Well, here was Peters, in a 1993 Groden video, claiming the head wound was 4 inches or so above where Lifton still claims Peters thought it was. This blows Lifton, who boasted, after all, that *"There is no comparison between an 'eyewitness to the shooting'--who may have had a fleeting glimpse of the President (and his wounding), a glimpse lasting a few seconds, and the observations of someone like Dr. Peters, who was in the Emergency Room, and had a chance to observe the wounds at close hand (just inches away), and with the experience of a trained physician"* completely out of the water.

The irony, then, is that Groden, in his book, presents an image of Peters (from apparently the same interview as the one shown in his video) pointing to the far back of his head, suggesting the possibility Peters DID say something to indicate the wound was on the far back of his head at one point in the

interview.

Of course, if he HAD actually pointed to the far back of his head in the interview, and indicated this was the exit location, it only makes sense that Groden would have used that footage in his video. The likelihood, then, is that Peters was, in the image used by Groden, pointing out the occipital region of the skull, and NOT where he thought he saw the exit wound...and that Groden pulled a switcheroo.

That Groden would willfully misrepresent Peters' recollections is not just speculation, by the way. As we've seen, in Groden's previous book, *High Treason*, he and his co-author Livingstone told their readers that the accuracy of the "McClelland" drawing had been verified by every doctor. Seven pages later, they presented a photograph of a 1979 letter from Dr. Peters to Livingstone, accompanied by a copy of the "McClelland" drawing with an "X" marked on it by Peters. In his letter, Peters explained *"I have marked an 'X' on the picture which more accurately depicts the wound, although neither is quite accurate. There was a large hole in the back of the head through which one could see the brain."* Then, twenty-four pages later, Groden and Livingstone discussed this letter. They reported: *"Co-author Livingstone first showed the official picture to Dr. Peters in 1979, along with the sketch approved by Dr. McClelland. He returned them, marking with an X the sketch of a large exit wound on the back of the head as being accurate, and rejected the official picture."*

Yep. You read that right. Peters told Livingstone the drawing wasn't *"quite accurate,"* and Groden and Livingstone turned around and claimed he'd verified its accuracy.

The next two deceptions have already been touched upon and are slightly more nebulous.

In the interviews presented in Groden's video, Jerrol Custer and Paul O'Connor demonstrate on themselves the dimensions of a wound stretching from the right front of Kennedy's head across the top and down along the back of Kennedy's head. Where Custer starts the wound and where O'Connor presents the wound at its widest is presented on the slide above. In Groden's book, however, he presents an image from the interview with Custer grabbed just as Custer's hand reaches the base of his skull to demonstrate the lowest part of the wound. He then quotes Custer, not quite accurately, saying that *"From the top of the head almost to the base of the skull, you could see where that part was gone."* Well, this is quite deceptive. When put right next to the photo of Custer with his hand at the base of his skull, Custer's use of the word "top" implies the top of the back of the head, not the front of the head, as shown in the video.

Groden's presentation of O'Connor is even more suspicious. While the quote attributed to O'Connor in *The Killing of a President* comes directly from the interview presented in Groden's video, the photo of him pointing to the back of his head comes from a different interview entirely. This suggests that a decision was made not to use an image from the interview in which O'Connor depicted the dimensions of the wound with his index fingers, and to instead present a photo of O'Connor pointing to the back of his head. This, of course, is deceptive. While the reader has no idea what O'Connor was saying when he pointed back behind his ear for that photo, it's clear he was NOT saying there was a fist-sized wound back behind the ear, a la Dr. Crenshaw, whose placement of the wound would otherwise appear to be identical.

From "mistakes" such as these, in which Groden misrepresented the statements of Custer and O'Connor to insinuate that the wound they saw was similar to the one observed by Crenshaw, it's easy to see why Lifton, whose own theory requires they saw a quite different wound, holds Groden in such low regard.

Head Scratcher #1001

Here's a quick aside, which I believe is both illustrative and entertaining. On May 17, 2011, while

discussing Kennedy's head wounds on the Education Forum, an online forum to which I regularly contribute, I posted The Case for Conspiracy slide above to demonstrate Groden's misrepresenting the recollections of the witnesses to suggest there was little difference between the recollections of the Parkland and Bethesda witnesses. This met with the following response from Dr. James Fetzer: *"The man is perpetrating a fraud. O'Connor and Custer were describing the wound AFTER HUMES HAD ENLARGED IT. Peters and McClelland were describing it AS IT WAS OBSERVED AT PARKLAND. David Lifton selected the wrong target when he went after me about 9/11. He should instead be gutting this guy regarding JFK!"*

Well, the "man" in the post was me. Fetzer had misunderstood the slide and had thought it was I who was proposing the descriptions matched, and not Groden. Well, this was incredibly ironic. You see, the "fraud" I was accused of perpetrating--trying to convince people the wound descriptions of the Parkland and Bethesda witnesses were actually quite similar--was one of the main thrusts of a 43 page article by Dr. Gary Aguilar in *Murder in Dealey Plaza*, a book conceived and edited by...Dr. James Fetzer!

Yep... On page 187, before describing the statements of the many witnesses, Dr. Aguilar claims *"In sum, on the location of, if not the exact size of, the major portion of JFK's skull defect--right rearward--there is NO disagreement between the autopsy report and both the Dallas witnesses and the autopsy witnesses."* And, should one think this a typo, on page 197, after discussing a few of the Parkland witnesses who'd recently changed their story, he claims that the early accounts of these witnesses *"were ONE with the reports of over 40 witnesses who saw JFK both at Parkland Hospital and in the morgue at Bethesda."* (Emphasis added).

And yet this was all news to Fetzer, who ultimately undermined the authority of his book (and indirectly himself) by acknowledging Aguilar was mistaken.

Sleight of Hole?

In Robert Groden's video, JFK: The Case for Conspiracy, a discussion of Kennedy's head wound becomes a case study in confusion. First, as the "McClelland" drawing at left above is shown, the narrator claims "The doctors from Parkland Hospital ALL described a massive exit wound on the President's head..." The skull sculpture at middle above is then shown, and the narrator finishes "... behind the right ear and extending into the occipital area which is at the extreme rear of the head." Hmmm... Then, a few minutes later, after discussing the recollections of the Bethesda witnesses, some who described a wound from front to back, Groden presents the skull sculpture and says "A bullet striking the president in the right temporal area would have exited in the occipital region in the rear of the head, and this would be completely consistent with the wound seen by the Dallas doctors." Hmmm... maybe, but the wound in front of the ear most certainly would not! Anyhow, later, after showing the autopsy photo marked with the circle at right above, Groden claims, of these very same witnesses: "Everyone said the area within this circle was gone." Well, heck. Only minutes before he'd shown some of these witnesses the version of the photo at right, and they'd agreed that the much smaller wound added onto this photo was similar to what they'd remembered. What was he up to? Was he pulling a fast one?

Sleight of Hole?

Unfortunately, it appears that Groden is more than mistaken.

As discussed, in his best-selling and highly-influential book *High Treason* Groden held that the wound location depicted in the "McClelland" drawing *"was verified by every doctor, nurse, and eyewitness as accurate,"* and that these witnesses described an *"exit wound... almost squarely in the back of the head (the occiput)."* Now, as we've seen, the photos in his subsequent book, *The Killing of a President*, prove this wasn't true.

But I guess that never sunk in... By the time of the interview presented in the 2008 documentary, Frame 313: *The JFK Assassination Theories*, Groden's story had sprouted wings. Where his claims had once had a kernel of truth--the witnesses he spoke to did indeed think the wound was further back on Kennedy's head than shown in the autopsy photos--he now claimed that of the witnesses he'd spoken to *"Every single one--not one, not two--more than 20 have said the photographs that show the rear of the head intact are forgeries."* Well, this wasn't true. While Groden may have come to believe from the statements of these witnesses that the photos were forgeries, most of them never said anything about the photos being forgeries. Many of them, in fact, specified that they thought the photos were accurate depictions of Kennedy's wounds, and that they were simply mistaken about what they'd remembered.

And yet, as recently as his 11-18-10 appearance on Black Op Radio, Groden was still claiming that he'd interviewed about 20 Dallas doctors, and that *"every single one of them, without exception, said that the shot that killed the President--the fatal shot--came from the right front--entered the right temporal area--and blew out the back of his head."*

Well, hell's bells. He's just wrong. Very very wrong. Wrong as wrong can be. Not only did few if any of these witnesses claim the official autopsy photos are forgeries, very few if any of these witnesses

described an exit wound that anyone could honestly claim was *"almost squarely in the back of the head"* and NONE of these witnesses said they saw an entrance wound in the right temporal area.

Now, to be fair, Groden's not the only one spreading this nonsense. In his 2010 book *Hear No Evil*, Don Thomas claims *"The opinions of the Parkland Hospital doctors that Kennedy was shot in the right temple was based largely on the blown out condition of the occiput, which they knew to be characteristic of an exit wound."*

But Groden, who has only been studying the case for forty years, and has spoken to the Parkland doctors, ought to know that none of these witnesses saw an entrance by Kennedy's right temple, and few, if any, have ever said they suspected there'd been such an entrance.

Now, one might take from this that the man's a big liar...

But when one watches his video, *JFK: The Case for Conspiracy*, it's hard not to conclude that he's simply stuck in a groove, and that he's a much better salesman than truth-teller.

In this video, to be clear, Groden pulls off quite a trick. First, while the "McClelland" drawing is shown the audience, the narrator claims "The doctors from Parkland Hospital ALL described a massive exit wound on the President's head..." A skull sculpture showing a wound from front to back is then shown, and the narrator finishes "...behind the right ear and extending into the occipital area which is at the extreme rear of the head." Hmm...Groden can't be trying to imply the Parkland witnesses saw a wound this massive, can he?

Groden then proceeds to discuss Dr. Cairns' conclusion the Harper fragment was occipital bone. He shows his viewers where this would place the wound--on the far back of his head. Then, while discussing Jackie Kennedy's testimony about holding her husband's skull on, he puts his hand to the back of his head at the level of his ear in the occipital region. Well, this suggests the large head wound was in this location, correct? Low on the back of the head in the occipital bone...

Uh, not entirely... Only moments later, after discussing the statements of the Bethesda witnesses, two of whom, Custer and O'Connor, described a wound stretching from the front of Kennedy's head to the back and down to the base of his skull (in other words, the state of Kennedy's head AFTER the scalp was reflected and skull fell to the table) Groden officially introduces the sculpture of Kennedy's damaged skull briefly shown earlier; this sculpture depicts a large head wound stretching all the way from the right temple to the occipital bone. Well, this is a bit strange. This sculpture, in effect, combines the wounds apparent on the Zapruder film and autopsy photos with the wounds described by the Parkland witnesses--the wounds most believe are in conflict. Groden then tells his audience "A bullet striking the president in the right temporal area would have exited in the occipital region in the rear of the head, and this would be completely consistent with the wound seen by the Dallas doctors." Yikes. Is he *really* suggesting the wound observed at Parkland--which the witnesses for the most part claimed was on the back of the head--was the massive wound described by Custer and O'Connor? Apparently, so. Never mind that none of the Parkland witnesses saw an entrance in the right temporal area. Never mind that none of them recalled seeing the large wound in front of the ear described by Custer and O'Connor, and depicted on the sculpture.

But I digress. Back to Groden's trick. After presenting a few more interviews with "back of the head" witnesses such as Robert McClelland and Charles Crenshaw, and showing some of them an autopsy photo with a wound added-in on the back of Kennedy's head in the parietal region, and getting them to AGREE that this was close to what they saw, Groden sums up their statements by presenting an autopsy photo of the back of the head and claiming "Everyone said the area within this circle was gone." Hmm...now what area was this, you might ask? Well, as shown on the slide above, the area within the circle--the area Groden was NOW claiming was, according to the Parkland witnesses,

missing--was an area on the right side of the back of Kennedy's head, mostly above his ear, primarily in the parietal region, stretching almost all the way to the large defect in front of Kennedy's ear. It was not "almost squarely on the back of Kennedy's head," as Groden had long claimed. It was not a wound primarily on the back of the head, as depicted on the autopsy photo with the wound added-in. It was not a wound beginning in front of the ear, where Groden had implied it was in his video only minutes before. It was not even centered in the occipital region, and consistent with a blow-out of the occipital bone, where Groden had implied it was before that.

So, what's the trick? Well, think about it. Whether by accident or design, Groden had presented a few Parkland witnesses claiming Kennedy's head wound was toward the back of his head, mostly above his ear, and mixed them in with a few Bethesda witnesses describing a much larger wound, and somehow ended up convincing tens if not hundreds of thousands of people (at one point including myself), this wound was 1) a large wound stretching from the front of the head to low on the back of the skull, 2) consistent with the wound seen in the Zapruder film, and 3) consistent with a blow out low on the back of the head in the occipital bone, when it was really 4) none of the above.

He had, in effect, presented three different versions of the wound--an occipital wound from whence the Harper fragment exploded, a mostly parietal wound of the back of the head seen by the Parkland witnesses, and the large wound on top of the head shown in the Zapruder film and seen at Bethesda--and convinced his audience the witnesses presented in his video supported all three...when they did not. Not even close.

Mr. Groden's Wild Ride

When one looks back through Robert Groden's books and videos, it's clear he's changed his mind about the appearance of Kennedy's head wound at Parkland Hospital. More than once...

In JFK: The Case for Conspiracy, published 1976, Warren Commission Exhibit 388, purported to represent the wound as seen at autopsy, was compared to a drawing of the wound as seen at Parkland Hospital. As demonstrated at left above, the wounds in these drawings were nearly identical. As demonstrated at right above, however, this wound would by 1989's High Treason split itself in two, with the wound as seen at Parkland now strictly on the back of Kennedy's head, in the location of the wound in the "McClelland" drawing (at near right) and a second wound unnoticed prior to autopsy by Kennedy's temple.

By 1993, however, the two separate wounds presented in the drawing by Ed Chiarini at left (which had been featured in High Treason), had merged to become the one gigantic wound on the sculpture by Ed Chiarini at right (which was featured in The Killing of a President). This new and enlarged wound, moreover, was now proclaimed to be "completely consistent" with the wound observed in Dallas. Really?

Mr. Groden's Wild Ride

Now, to be fair, it seems more than likely that Groden, in his pretending the wound described by Custer and O'Connor was the wound observed at Parkland, did not think he was deceiving anyone, and that no one has been more victimized by Groden's deceptions than Groden himself.

I write this, in part, because I've met the man, and believe him sincere. For many years, on weekends and holidays, he has stood on the grassy knoll, talking to tourists and those with an interest in the assassination. He has spent much of this time correcting misconceptions about the assassination. Apparently, however, he has spent so much time and energy defending his own take on the medical evidence, that the facts have, for him, become somewhat blurred. While he once noted inconsistencies between what the Parkland witnesses described and what is apparent in the Zapruder film, he has, over time, come to ignore these inconsistencies. Perhaps to simplify things for those looking for a quick explanation... Perhaps to simplify things for himself..

This is best demonstrated by retracing Groden's steps. In his first book on the assassination, JFK: The Case For Conspiracy, published 1976, before he'd gained access to the autopsy photos, Groden and his co-writer F. Peter Model followed Josiah Thompson's lead and proposed that Kennedy had been hit twice in the head, first from behind and then from the front, and that the difference between the head wound as described by the Parkland doctors and Bethesda doctors was largely a difference of perspective, with the Parkland doctors describing the large hole on Kennedy as an exit on the back of the head, and the Bethesda doctors describing this same hole as an exit on the top of the head.

With the publication of Lifton's Best Evidence in 1981, and its focus on the incongruity of the Parkland and Bethesda descriptions of the head wound, however, such a position was no longer practical. So, with High Treason, published 1989, Groden and his co-writer Harrison Livingstone presented a bit of a compromise. As shown on the slide above, they presented the "McClelland" drawing created for Thompson as a depiction of the ONE WOUND observed at Parkland, as the exit wound of a bullet entering at the large defect in front of Kennedy's ear shown on the Zapruder film and autopsy photos. They claimed the autopsy photos failing to show this wound had been "forged." They claimed, furthermore, that the top of the head wound shown on the Zapruder film was "*easily overlooked*" by the Parkland doctors after Mrs. Kennedy closed up her husband's head. Now, when one looks at the autopsy photos showing a gaping hole at this location, this claim is awfully hard to believe. But they had an explanation for this as well. Yes, in the photo section of the book, in a caption to the autopsy photo of the top of Kennedy's head, they asserted, "*The conspirators sawed off the top of the head and removed the brain and bullets before the autopsy.*"

Well, this, right there, revealed the incredible sloppiness of Groden and Livingstone's theories. When discussing the "back of the head" photo, they reported that all the witnesses said it failed to show what they remembered, and that the photo must therefore be a fake. They then wrote that the failure of "some" of the witnesses to stand by their earliest impressions the photo was a fake, was because they'd become aware of David Lifton's theory the body had been altered, and had concluded the hole on the back of Kennedy's head had been covered by a flap for the photo. They then spent two whole pages (49-51 in the paperback) explaining why Lifton's theory made no sense, in large part because they'd spoken to Kennedy's friend, David Powers, and he'd assured them that he and others loyal to Kennedy had kept watch on Kennedy's casket for the whole trip from Dallas.

So when, exactly, did THEY propose "*the conspirators sawed off the top of the head?*"

In any event, with The Killing of a President, published 1993, Groden further distanced himself from Lifton's "body alteration" theory, and wrote it off as an "*assassination myth.*" This left him with no explanation for the Parkland witnesses' failure to note the large hole on the top of Kennedy's head seen in the Z-film. No matter. None offered. Second, where he once presented a drawing showing two large

head wounds--an entrance on the top of the head by the temple, and a blow-out in the occipital region--by artist Ed Chiarini, as a depiction of *"what the head wounds looked like,"* he now presented a sculpture by Chiarini of one large wound stretching from front to back. Never mind that none of the Parkland witnesses described such a wound. Never mind that the Bethesda witnesses describing such a wound were almost certainly describing the wound after the scalp was reflected, and skull fell to the table.

From these changes then, I think it's fair to assume that Groden, like so many of us, has trouble making sense of all this, and that his deceptions are rooted in his fervent desire to reconcile the Parkland eyewitness evidence with the Zapruder film, the recollections of the Bethesda witnesses, and his understandable reluctance to accept Lifton's "body alteration" theory.

This is perhaps best illustrated by taking a closer look at one of his more consistent claims.

From High Treason to the present time, Groden has repeatedly claimed there is a "volcano-shape" on the back of JFK's head apparent in the Zapruder film. He claims, furthermore, that this "volcano-shape," apparent for but a fraction of a second, represents a blow-out on the back of JFK's head. In *The Killing of a President*, moreover, he falls prey to exaggeration, and claims that the "McClelland" drawing depicting a blow-out wound mostly below the top of the ear "exactly matches the volcano image appearing in Zapruder frames 335 and 337" mostly above the top of the ear.

What he fails to perceive or acknowledge, however, is that this "volcano-shape" only becomes apparent when Jackie Kennedy runs her hand across her husband's back, from his right shoulder back toward his head, and that the "volcano-shape" is almost certainly an illusion created by her white glove blocking out part of her husband's head. (This is shown below, in a GIF file created by Bill Miller).

Now, this error by Groden--his thinking a blow-out is apparent on the Z-film and that the statements of the Parkland witnesses are therefore not at odds with the film--is highly suggestive that he is prone to

suggestion, and has a desperate desire to believe both that the film is accurate and that the head shot came from the front.

Now, to be fair, Groden's far from alone in seeing things in the film that really just aren't there. In *Head Shot*, published 2010, research physicist G. Paul Chambers once again demonstrated what we should already know--that having an education is not all it's cracked up to be. In his effort to demonstrate that the medical evidence is hopelessly conflicted, and therefore of little help in understanding what actually happened, Chambers both ignores important evidence and makes a number of strange claims about the evidence he does acknowledge. Astoundingly, not only does he fail to mention that the Dealey Plaza witnesses supported the accuracy of the Zapruder film and autopsy photos, he insisted that the Zapruder film, autopsy photos and autopsy report were in conflict, as the Zapruder film failed to show a wound on the top of the head.

This is nonsense of a supreme order. While watching the film, or while looking at the Gif file above, a disruption of the outline of the top of Kennedy's head is painfully obvious. A bone flap angled down near his face is even more obvious... Well, where does Chambers think this bone flap came from? Amazingly, the side of Kennedy's head. Yep, while discussing Zapruder frame 333, towards the end of the sequence above, he not only claims that "No visible damage of any kind is apparent at the top of the head, from the right ear to the top of the sagittal crest" but that "The only visible damage is to the right side of the head."

Chambers' clear mistake puts Groden's mistake in context. One might even venture that everyone to study this case in detail has come to have a theory, and that having a theory has led them to seek support for their theory, and occasionally see things that just aren't there.

The Slippery Slope

High Treason, 1989: This drawing was "verified by every doctor, nurse, and eyewitness as accurate."

When one compares the descriptions and depictions of Kennedy's head wound in Robert Groden's books and pamphlets, one becomes aware of an alarming fact. Whereas he once claimed that the wound depicted in the "McClelland" drawing, at top left, was verified to be accurate by the Parkland witnesses, and excused their lack of acknowledgement of the bone flap seen on the Zapruder film with the claim the flap was closed en route to the hospital, he later suggested they'd seen the bone flap, and still later suggested they'd seen the one massive wound from front to back he believes was observed at the autopsy.

High Treason, 1989: "How the wounds actually looked."

The Killing of a President Dealey Plaza Memorial Edition, 1998: "a computer generated version of (an autopsy) photograph restoring the original rear exit wound according to nearly thirty witnesses to the head wound."

He seems aware of this slide down the slippery slope. By 1998, he'd stopped claiming that the Parkland witnesses had verified the accuracy of the "McClelland" drawing, and had instead begun claiming that "the nature of the head wound" in the "McClelland" drawing had been "confirmed" by the witnesses, along with the fact "that the exit wound was in the rear of the head." This concealed that none of the witnesses had confirmed the "entrance" wound in front of the ear Groden swears by.

JFK: The Case for Conspiracy, The Killing of a President Memorial Edition: 2008: "The original photograph showing the rear exit wound according to nearly thirty witnesses to the head wound."

The Slippery Slope

Groden's mistake regarding the "volcano-shape" would be less troublesome, however, if Groden hadn't also--through his presentation of Ed Chiarini's sculpture in *The Killing of a President*, and in his pamphlets for sale in Dealey Plaza--suggested what anyone who's studied the case knows just isn't true: that the large head wound above and in front of the ear shown in the Zapruder film was readily observed at Parkland. This just ain't so. None of the Parkland witnesses described an entrance on the front of Kennedy's head, and none of them noted the large defect in front of Kennedy's ear readily apparent in the Zapruder film.

Not that Groden will admit as much. Nope, in one of his worst mistakes or biggest lies, take your pick, Groden implies in *The Killing of a President* that the wound shown on the Zapruder film was observed at Parkland, by claiming "Dr. McClelland, who had been called to the Trauma Room when Mr. Kennedy was admitted to Parkland Hospital, said that the cause of death was attributable to 'a massive head and brain injury to the right temple.'" Right temple. He wrote "right temple." Only that's the wrong temple. Yep. As we've seen, McClelland, in what he would later admit was a mistake, actually wrote "The cause of death was due to massive head and brain injury from a gunshot wound of the left temple." Groden had completely misquoted him, and changed the meaning of his words.

While I acknowledge it is possible McClelland *did* see the wound shown on the Zapruder film, and *meant* to say the wound he saw was on the right temple, Groden certainly should not have presented him saying as much in an exact quote, and his doing so is highly deceptive. His presenting Jerrol Custer and Paul O'Connor in his book as witnesses to a wound on the far back of the head when they in fact described a wound stretching from the front to the rear is, of course, also problematic. A more conservative researcher/writer would not have written, as Groden did in *The Killing of a President*, that the wound seen at Parkland was a "large hole in the right rear of the head," and then offer that "The

autopsists also described the wound as such, but larger," without admitting that the recollections of the Bethesda witnesses actually differed substantially from the Parkland "back of the head" witnesses. A more conservative, and *reliable* researcher, for that matter, would NEVER present a colorized version of an autopsy photo--with a large head wound added onto the photo stretching from front to back--and then claim this was the "original" photo, "according to nearly thirty witnesses," as Groden does in a pamphlet for sale in Dealey Plaza. I mean, that's just not true. One can only wonder how many of those buying or even browsing through this pamphlet and seeing this photoshop of horrors have walked away from Groden's table in Dealey Plaza thinking they'd seen the original autopsy photo without realizing that none of the Parkland witnesses Groden implies had verified this photo had actually done such a thing.

"Groden's "mistakes," in sum, lead me to suspect that, in his desperation to refute Lifton's theory the body was altered between Parkland and Bethesda, he has taken some serious short-cuts, and inadvertently deceived his readers. One simply can't trust him on this stuff.

And yet... it cannot be ignored that the locations given for the head wound by the "back of the head" witnesses seem to group around the "area within the circle" discussed by Groden in his video...a few inches higher and forward of the wound in the "McClelland" drawing, and a few inches back of the wound in the autopsy photos.

Chapter 18d: Reason to Believe

Why I believe the autopsy photos are authentic, and the Parkland witnesses were wrong

The Missing Mark

When one compares the face sheet depicting Kennedy's wounds created on the night of the autopsy (at left) with CE 386, a drawing made for the autopsy doctors to help them with their Warren Commission testimony (at middle, above), one notices, almost immediately, that the location of Kennedy's back wound has changed. Equally intriguing, however, is another change—the addition of a large exit wound on the back of Kennedy's skull. This raises a number of questions...

1) Since the face sheet depicts every wound and incision on Kennedy's body, save the large head wound, shouldn't we take from this that the wound was not visible when viewed from in front or behind (as supported by the autopsy photo above?) 2) Since the doctors changed the back wound location for the drawings created for the Warren Commission—almost certainly to help minimize discussion of a possible conspiracy—wouldn't they, should they have been determined to misrepresent the head wound location as well, have depicted the wound in CE 386 more forward on the skull? And 3) Isn't it possible, even likely, that the head wound appearing in CE 386 was not depicted on the face sheet because it was not apparent at the beginning of the autopsy, and only became apparent when the scalp was peeled back?

The Missing Mark

Since so many witnesses thought Kennedy's large head wound was further back on his head than the wound depicted in the photos, what can we take from this fact, if not that the wound was really on the back of his head, and the photographs fakes?

Well, as strange as it may seem, the fact that so many described a wound further back on the skull than is depicted on the autopsy photos and x-rays has actually solidified my conclusion that the wound was as depicted in the autopsy photos and x-rays.

The keys to this admittedly strange conclusion are the Rydberg drawings made under the supervision of the autopsy doctors, and admitted into evidence by the Warren Commission as Exhibits 385, 386, and 388.

When one compares the face sheet created at Kennedy's autopsy with CE 386, the assumption the back of the head witnesses were mistaken takes root. Since the evidence is clear the back wound has been moved between these two drawings, and since our study of the back wound suggests this was no accident, it only makes sense that, should the autopsy doctors have had concerns about there being a large exit wound on the back of Kennedy's head, they would have moved that, too.

But that's not what happened. While the location of the large head wound is not depicted on the face

sheet, it *is* presented on the back of Kennedy's head on CE 386.

Hmmm...let's put on our thinking caps.

Hmmm...does the absence of the large head wound from a face sheet marking every other incision and wound suggest that this wound was not readily visible from the front or behind? Possibly.

Hmmm...is this possibility supported by the autopsy photos, which, strikingly, show the large head wound to be nearly invisible when viewed from behind. Yes, absolutely.

Hmmm...since there is hair on the president's head in the other drawings created for the Warren Commission, CE 385 and CE 388, is the lack of hair on his head in CE 386 suggestive that this was how the doctors thought his skull might appear beneath his hair and scalp? Yeah, sure.

Reason to Believe

Since the eyewitnesses, taken as a whole, suggest the large head wound was NOT on the far back of Kennedy's head, as proposed by most conspiracy theorists, but on the upper right side of his head, a few inches back of where it is shown in the autopsy photos (at left and center, above), a thought occurs... WHY would anyone fake photos of a wound in this location to hide that a shot was fired from the front when such a wound could simply be described as an exit? As seen at right, CE 388, the drawing of the wound published by the Warren Commission, presented the wound in the middle of the right side of the skull, where it could be an exit for a shot from either the front or the back. Since our study of the back wound suggests the doctors deliberately misrepresented *its* location in their drawings, why would the government have taken the extra step and moved the head wound forward for the photos no one was supposed to see, then let the doctors slide it back on the drawings everyone would see?

Reason to Believe

Hmmm...since the depiction of the damage to the back of the head on 386 is essentially the same as on 388, in which hair is presented, is it fair to assume from this that the autopsy doctors, and by extension the Warren Commission, were largely unconcerned about how having an exit on the back of Kennedy's head might appear? Yep. You got it.

Well, this, then, supports that there was no mass conspiracy to hide the wound on the back of the head suggested by the Parkland witnesses, and that the autopsy photos were not faked, and that, instead, the

Parkland witnesses were simply --er, rather, not so simply -- mistaken.

If the wound was on the back of the head, after all, and the face sheet the accurate depiction of the President's wounds conspiracy theorists believe it to be (because it is so problematic for the single bullet theory), well, then, why isn't the wound on the face sheet?

If the doctors were willing to move the back wound to help support the single assassin theory, after all, then why not move the head wound to support this theory? As we've seen, they exaggerated Kennedy's forward lean in 388, and helped sell that the fatal shot came from above. So why, if there were concerns about a wound on the back of Kennedy's head, not just move the wound forward of its location in 386 and 388?

Hmmm...since it makes no sense whatsoever for the government to fake top secret photos to hide a wound in the location described by the bulk of the back of the head witnesses, and then publish drawings of a wound in that same location, we can rightfully assume those claiming the wound was further back than in the photos...were mistaken.

But if this is so--if the head wound did not in fact stretch to the back of the head where so many claimed to have seen it...well, then, why? How could they be so mistaken?

Hmmm...let's put back on our thinking caps...

Well, one possible factor in so many of the Parkland witnesses thinking the wound was further back than as shown in the autopsy photos has to do with the way people perceive the human face. While recollections of the exact location of the President's head wound varied from being on the top of his head to being at the very back of his head, all the witnesses remembered clearly and correctly that the wound was not on his face. It seems likely then that the main focus of everyone's attention was in fact the President's face. When one considers that most people perceive their ears as representing the far sides of their face, it's possible to understand how a witness to a wound not on a face could remember it as being a wound behind the ear. And once someone remembers something incorrectly they will usually continue to remember it incorrectly, as their mind loses its original impressions and becomes instead a memory of what they most recently remembered.

The research of Dr. Elizabeth Loftus provides us with a model for this kind of argument. On Table 3.1 of her book *Eyewitness Testimony* she presents a chart demonstrating memory accuracy in relation to saliency or importance. This shows that when it came to salient details, (what was determined after the event to be most frequently discussed or noticed) the recollections of the eyewitnesses to the event used as a test were up to 98% accurate, while the recollections of the details that were less widely noticed were as low as 64% accurate. Since no one at Parkland Hospital had a clue where the shots came from, or what the position of the limousine was on Elm Street when the shots were fired, there is no reason to believe the exact location of the President's head wound would have been considered a salient detail. What one might assume was a salient detail was whether or not the President's handsome face had been damaged, since on that detail the witnesses were 100% accurate. Admittedly, this is working backwards. Perhaps someone can design a test to see if people used to looking at something in an upright position, such as the President's face, will remember a defect on the top of that object while it is lying flat, as a defect on its back.

Professor Barbara Tversky of Stanford University has conducted a number of tests similar to the one I've proposed. In her articles and papers, available online, she describes studies that demonstrate:

- 1) People engage in selective rehearsal when they retell events, leaving out certain details to accomplish a maximum effect. The re-telling of these events reinforces certain aspects of the event and downplays others. Over time, the original memory is replaced by the memory that has been re-told.

(This could help explain why so many witnesses' stories have changed.)

2) When people talk about their emotional response to a traumatic event, they encode a better memory of their emotional response to the event, but make more mistakes in free recall. (This could help explain why the stories of the most passionate witnesses have changed the most.)

3) When people are forced to take a position of advocacy on an event on which they initially had no bias, their memories become biased as a result. (This might help explain the behavior of Earl Warren and Arlen Specter.)

4) People tend to describe environments as if they were viewing them from above. (Since Kennedy's wound on the top of his head was on the far side of those standing at the foot of his bed, this might cause them to remember it as being on the back of his head, the *far* side when viewed from above.)

5) Mental rotation of an image is one of the most difficult transformations made in the human mind. (Dr. Robert McClelland, who stood at the head of the table looking down on Kennedy and whose later statements and drawings have been used by conspiracy writers to support that the President's large head wound was on the *back* of his skull, originally stated "The cause of death was due to massive head and brain injury from a gunshot wound of the *left temple*." There were others who remembered the head wound being low on the back of the head, where they couldn't have even seen it.)

6) People make small corrections in their memory. Nearly symmetric items are remembered as more symmetric than they really are. When people are shown two outlines of South America, for instance, one as it appears on a map and one as it would appear if its northern-most point was directly in line with its southern tip, people incorrectly pick the "corrected" version when asked to pick the actual shape of the continent. (Perhaps this explains why some of those who remembered the wound as being on the back of Kennedy's head had clear memories of it being smack dab in the middle of the back of his head.)

Unfortunately, regular contact with researchers, who've tracked down eye witnesses years after the fact and asked questions about details that witnesses would normally not remember even the next day, has almost certainly added to the decay in eyewitness reliability. When attempting to remember things so far in the past, witnesses are likely to inadvertently mix together their memories with suggestions offered by the researchers, and accidentally create false memories. While a question such as "Did you see any men behaving strangely?" might illicit a simple "no" for an answer, a question such as "You know there are a lot of us who believe there was a headshot from the area of the grassy knoll, and the Zapruder film reveals the shot came from the front...A number of others recall seeing a man in a hat. I was wondering if you saw anyone running in that direction..." might illicit "Y'know, I think maybe there was someone. It seems I recall a man in a hat running over there. Yeah, I remember."

While not making a specific reference to the Kennedy assassination, a July 2009 segment on CBS' 60 Minutes dealt with this very issue. Iowa State University Professor Gary Wells, interviewed by Leslie Stahl, detailed a study in which people were shown a tape of a crime, and then asked to identify the perpetrator in a line-up. Despite the fact the perpetrator was not in the line-up, most selected the suspect bearing the closest resemblance to the perpetrator. Now, this would be bad enough, but Wells studied the effect of positive re-enforcement on this identification, and received some startling results. He found that when his subjects were lied to and told they'd made a correct identification, they were more than 6 times as likely to say they'd had a good look at the suspect. He also found a more than 350% increase in those claiming they were "certain" of their identification in those who'd been told they'd been correct. This, of course, not only suggests that the memories of many of the eyewitnesses "friendly" to conspiracy theorists have been tainted, but that the memories of many of the witnesses "friendly" to the position Oswald acted alone, who continue to be convinced of his sole guilt without ever studying the case, are equally tainted.

Perceptions of Perception

Nothing is moving in the image above. The movement is all in your mind.

Perceptions of Perception

But how can this be, you might ask? Can the memories of doctors, seasoned professionals, while on the job, be as unreliable as that of an average Joe witnessing a crime?

Absolutely. The more I have read of cognition and memory, the more I have become convinced that the Parkland witnesses who remembered seeing one large wound on the *back* of Kennedy's head were mistaken, and that they had mis-perceived or mis-remembered a wound that was in fact in front of Kennedy's ear. One's perception of reality is highly subjective, a mixture of what one expects to see, what one wants to see, and what is actually there. Magicians and illusionists have known this for centuries. TV producers are aware of this as well (see the chapter entitled Bullshit and Beyond).

A discussion of cognition and memory follows...

The Encyclopedia of the Paranormal notes that "We all have a blind spot in our visual fields that our brains fill in. In the area of the retina where the branches of the optic nerve collect to exit the eyeball all visual receptors are pushed aside. Thus there is no registration of stimuli from the corresponding area in space. Yet none of us notices the gap—the brain fills it in by extrapolating the scene on all sides of the blind spot." *(This means that a certain percentage of what we actually see is invented in our minds based upon what we expect to see. This has implications for memory as well. FWIW, I also read about this in a Time/Life book on the senses.)*

Additionally, Blackmore, in *Dying to Live*, notes that "under severe psychological stress, physiological trauma, or attentional manipulations such as meditation, sensory deprivation or hypnosis the brain's representational apparatus may lose access to the sense data that are ordinarily its most predictive and useful inputs. So deprived, it begins to search for the next best alternative, usually images stored in

memory banks.” (This leads me to believe that watching the death of a much-loved or respected person might hinder a witness’ ability to accurately remember the fatal wounds. More specifically, the sight of Kennedy lying dead on his back may have led some or all of the Parkland witnesses to remember images of him while he was alive, and standing up. These images of an erect Kennedy may have led to their remembering the wounds on his body as though he were standing up. A wound behind his ear while he lay on his back--at the top of his head-- might thereby have been transposed to a wound behind his ear while standing--at the back of his head. Admittedly, this is reaching...)

Even so, a 1992 article in *Memory and Cognition* by Reinitz, Lammers, and Cochran confirms: “Miscombination of stored stimuli features can produce illusions of memory.” They then break down that: 1) “research has supported the notion that memories are sometimes reconstructed at the time of retrieval;” 2) “research has clearly demonstrated that subjects mistake their inferences for material that they had actually experienced;” 3) “Underwood (1969) proposed that memory for an event consisted in a collection of quasi-independent attributes such as spatial relations between stimulus items, stimulus frequency, etc;” 4) “findings demonstrate that in many situations, subjects can retrieve some stimulus features in the absence of others.” They then summarize their findings by stating “previously encountered stimuli that cannot be consciously remembered can unconsciously affect judgments by producing a feeling of familiarity...in the current experiments, the subjects were unable to explicitly remember all of the stimuli they had seen during study. Instead, the subjects based their recognition responses partly on the degree to which the stimuli seemed familiar. Since conjunction stimuli contained more old features than did feature stimuli, they produced greater overall familiarity and so were judged as old (familiar) more often.” *(From this it seems likely that, in opposition to the beliefs of most researchers, the Parkland doctors would be more likely to remember the locations of Kennedy’s wounds incorrectly than would laymen. They knew what the President looked like. They knew what a gunshot wound on the back of the head looked like. Thus, a mental image of the president with a wound in this location would feel more familiar to them than to non-medical personnel.)*

Still, researching how doctors might *remember* a wound incorrectly is probably beside the point. Since most of the doctors at Parkland reported Kennedy’s head wound incorrectly from their earliest reports, we need to explore whether so many could logically *perceive* something incorrectly in the same manner (or nearly the same manner—the exact location of the rear head wound as depicted by the Parkland witnesses in Robert Groden’s book *the Killing of the President* varies slightly from photo to photo). A 1979 article in *Cognitive Psychology* by Nickerson and Adams demonstrates that often people will recall items they look at every day incorrectly and in a fairly uniform manner. They found that of the eight features (front and back) of four U.S. coins--pennies, nickels, dimes, and quarters--the average American could accurately recollect only three of them. A 1983 article in *Memory and Cognition* by Rubin and Kontis followed up on this and found that when asked to draw the front sides of these four coins from memory, the drawings most frequently created by the participants in their study depicted the President’s left profile (the penny, in fact, depicts Lincoln’s *right* profile), centered (the dime, in fact, displays Roosevelt’s head to the *right* of center), with the words IN GOD WE TRUST across the top (the penny, in fact, is the *only* coin with those words across the top), the value of the coin, i.e. one cent, five cents, etc., across the bottom (*none* of them, in fact, have the denomination on the front side of the coin) and the year written horizontally on the right (the quarter displays the year on the bottom and the nickel has it vertically on the right). None of the coins as most commonly recalled had the word LIBERTY on the front of the coin, when, in fact, it is on the front of every single one of them. When Rubin and Kontis asked their subjects to suggest a design for a new coin, moreover, they found that the most common design suggested was identical to the most common representation of the other coins—a left profile with IN GOD WE TRUST across the top, the year on the right and the denomination on the bottom. *(This suggests that people’s visual memories are not like cameras and that the specific features of an image can be altered in one’s memory to fit a pre-conception of the image. More importantly, it*

suggests that these pre-conceptions are not random and that there is something about the way we process information that distorts the substance of the information we process.)

This last point is re-enforced by the following exercise.

Count every ' F ' in the following text:

FINISHED FILES ARE THE RESULT OF YEARS OF SCIENTIFIC STUDY COMBINED WITH THE EXPERIENCE OF YEARS...

Now, how many were there?

3? 4?

Wrong. For some reason, when people are asked to look for "F"s they almost always overlook the "F"s in words where the "F" makes the sound of a "V", such as the "F" in "of". There are three "of"s in the above text. The correct answer is therefore six. That we can be blind to letters right in front of our face simply because the words containing these letters use these letters in unorthodox ways undoubtedly supports that we can be confused by the appearance of an object, and think something on the top of someone's head, was on the back of his head. I mean, I looked at the above text three times before I spotted the three "of"s. And I was looking for the "F"s.

Should one doubt that eyewitnesses could uniformly misinterpret something as basic as the location of a head wound, however, one should look at the illusion below created by Edward Adelson. Square A is darker than square B, right? I mean, we can all tell dark from light, right?

Edward H. Adelson

Wrong again. When one follows a line the shade of square A down to square B, one can see that square A and square B are indeed the same shade, and that our brain has adjusted for the shadow coming from the cylinder by perceiving square B at a shade lighter than its actual shade.

Edward H. Adelson

So, could the "shadows on a checkerboard", so to speak, lead the Parkland witnesses to improperly recall the location of Kennedy's head wound?

Or is there something intrinsically different about improperly perceiving shades of gray and improperly perceiving the appearance of another human being?

A Matter of Perspective

The portrait of Einstein at left is an image designed to demonstrate the effect perspective can have on an image. (Image published in the March 31, 2007 edition of New Scientist, and the May 2009 edition of Wired.)

When the image is seen from a greater distance or is made smaller, as above, the fine crinkly hair and mustache become harder to perceive, and the image of Einstein begins to transform.

When seen from even further away, or made even smaller, in fact, the image of Einstein at left becomes, gulp, the image of Marilyn, above.

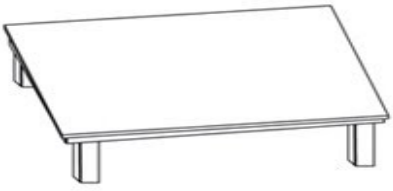

A Matter of Perspective

The Einstein-Monroe illusion, in which an image of Albert Einstein becomes an image of Marilyn Monroe as it grows smaller to the eye, demonstrates that the fine details of an image that can not even be seen from distance can drastically change one's perception of the image when viewed from up close.

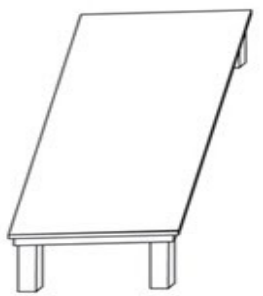

This should make us wonder if there were some minor details visible in the autopsy photos--which show the large head wound to be on the front half of Kennedy's skull--which escaped the attention of the eyewitnesses claiming the wound was on the back of the head.

In the Einstein-Monroe illusion the addition of crinkly hair, crinkly eyebrows, and a mustache, which can only be seen when viewing the image up close, changes the image from one of Monroe to one of Einstein. Was there a detail missing from the Parkland witnesses' recollections that led them to improperly recall the location of the large head wound?

Rotation and Perception

At left and right: Shepard's Tabletop Illusion. The rotation of the table at right contributes to its appearing longer and thinner than the table at left. They are in fact the same size. This shows that the rotation of an object alters our perception of the object.

At left and right: the Margaret Thatcher Illusion. The face at left is the upside down face of Britain's former Prime Minister Margaret Thatcher, right? Not exactly. It's the face of Ms. Thatcher with her eyes and mouth as normally seen inserted into an upside down picture of her face. It looks a little odd.

When we flip it over, however, as at right, we see that this face is more than a little odd, it is positively monstrous. Our different perceptions of these two images—which are in fact the same image—shows that rotation has a tremendous influence on our perception of facial features.

Rotation and Perception

I suspect there was. When I began researching facial recognition I was surprised to find that there has been a substantial amount of research on the difficulty of properly interpreting faces when seen upside down. The results of this research support the conclusion that the Parkland doctors' seeing Kennedy solely while he was lying on his back--and thus in a rotated position-- played a factor in their subsequent confusion about the exact location of his wounds.

In an article in the Journal of Vision entitled "Are Faces Processed like Words?" Marialuisa Martelli, Najib J. Majaj, and Denis G Polli decided yes, they are. They also noted that just as we have trouble reading words upside down we have great trouble reading faces upside down. This is significant as Kennedy's head wound could not have been viewed while looking at his face from the front. As he was lying on a stretcher, a wound on either the top or the back of his head could only have been viewed with his face in profile or upside down. A 1986 article in the Journal of Experimental Psychology by Diamond and Carey indicates that expertise has little bearing on this issue. Their studies showed that dog experts had as much trouble identifying upside down photos of individual dogs as non-experts. A 1987 article by Young, Hellawell and Hay in Perception is also helpful. They found that when they made photographic composites of famous faces their subjects had more trouble recognizing the faces when looking at them right side up than when looking at them upside down. They concluded that when faces are viewed right side up people interpret them as a whole, but when turned upside down they

recognize them based upon their isolated features. This research was supported by a 1993 study reported in *Cognitive Psychology* by Bartlett and Searcy. Their research indicated that altered faces with inverted eyes and mouths were perceived as being far less grotesque when viewed upside down than when viewed right side up.

A 1998 article in *Perception* by Dominique Valentin, Heve Abdi, and Betty Edelman further tracked the accuracy of facial recognition against rotation. They found that people were more than twice as likely to identify a face incorrectly when it was rotated 90 degrees. They also found that people use two strategies in facial recognition. When rotated less than 30 degrees, faces are identified by their configuration, i.e. how the eyes, nose, mouth, and ears all fit together. (Thus, they process the features collectively, or “wholistically”.) Faces rotated more than 30 degrees, however, are identified by their peculiarity, i.e. their distinctive marks.” (Thus, they process the features separately.) Those seeing Kennedy in the crowded emergency room, therefore, would most logically have recorded the images of his head wound without a specific reference point. Upon recall, however, they might very well have remembered that the wound was surrounded by hair and in back of the ear. The wound described by the doctors and the wound seen on the photos are both in the hair *and* behind the right ear, when viewed from different angles. If a doctor remembered the location incorrectly, and discussed its location with his colleagues afterward, he might very well have influenced their memories as well.

The effect rotation or inversion of an image has on our ability to measure spatial differences has also been studied. A 2000 article in *Perception* by Freire, Lee, and Symons noted that “accuracy in detecting spatial differences among faces fell from 81% with upright presentation to 55% with inverted presentation. By contrast, accuracy in detecting featural differences was unaffected by inversion (91 vs. 90).” Here once again, we see that people are more than twice as likely to make mistakes when reading a face that’s been rotated away from the upright position. A 1990 study reported in *Perception* by Kemp, McManus, and Piggott had achieved similar results. It concluded that “subjects are significantly less sensitive to the displacement of features in negative or inverted faces than they are in normal faces...” Their study also measured recognition errors related to the horizontal movement of features against recognition errors related to the vertical movement of features. They concluded that when photographs are altered via the movement of the eyes further apart, closer together, further up, or further down, people will fail to notice the vertical movement almost three times as often as they will fail to notice the equivalent horizontal movement.

If one is to take these last two studies in tandem, therefore, and assume that half the spatial differences reported in the 2000 study were vertical differences, then one might venture that a person is more than 3 ½ times more likely to make a mistake involving the vertical location of a wound on a man’s head when he is lying down than when upright. Is it just a coincidence then that this is the mistake suggested? Is it so illogical to assume that such a mistake occurred? Further support comes from *Perception of Faces, Objects, and Scenes*, edited by Mary Peterson and Gillian Rhodes. This article summarizes much of the recent research on face recognition and reinforces that we identify faces based upon the relative positions of its features, that we do this best when the face is upright, and that when we identify faces piecemeal, such as when it’s been rotated more than 30 degrees, we make mistakes.

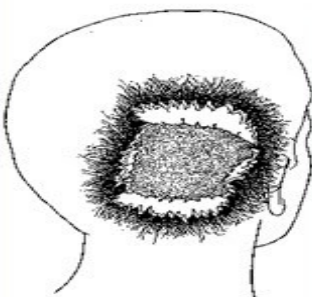

In 2009, while browsing through a 1964 book entitled *Perception*, edited by Julian E. Hochberg, I realized why none of this research regarding facial recognition should come as a surprise. From our youngest days, we learn to recognize people even when they are at a distance... Even when they are at an angle... Even when they are upside down... We don’t look at a far off man and say "Wow! Look how small he is!" We don’t look at an upside down face and say "Holy moly, that man has his mouth where his eyes should be!" No, we look at the upside down face, compare it to what in our mind’s eye we THINK his face would look like if turned upright, and compare it to faces known to us. We then recognize the face as dad looking down at us in our crib.

We continue to do this in adulthood. As a result, when we look at faces at angles other than the upright position in which we normally identify them, we don't actually SEE them as they are. We INTERPRET them in our mind's eye, and compare them to faces we've seen before...in the upright position. It only makes sense then that those looking at Kennedy while he lay on his back would be looking at his face, and identifying his face based upon 1) their interpretation of what his face would look like when upright, and 2) their recollection of what Kennedy looked like when upright. They were not studying his face or his head wounds as they were in three dimensional space. It should not be surprising, then, that some confusion would result...

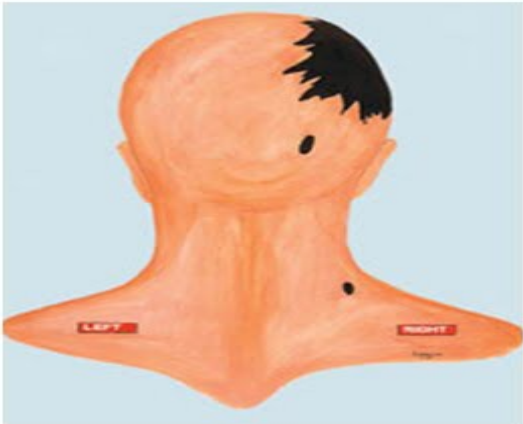

Should one still doubt that our perceptions are so erratic that people might remember a wound behind the ear while lying flat (a wound on top of the head) as a wound behind the ear while standing (a wound on the back of the head) one should contemplate a happy face. Literally. We perceive happy faces and caricatures as representing human faces, but they do not resemble us at all. Our nose is not in the middle between the tops of our heads and our chins, our eyes are. Our foreheads are the same size as our mouth, nose, and chin combined, and yet we scarcely even notice them, let alone represent them accurately on stick figures or gingerbread men... Our acceptance that happy faces resemble faces suggests that we pay little attention to the relative positions of our ears and forehead to our face, and that any wound remembered in relation to our ears and forehead is a wound likely to be remembered incorrectly.

But do the Dallas doctors' earliest statements support this conjecture? Is there anything in their words to suggest they inspected the back of the head, or located the wound in comparison to the hairline or neck?

Statements and Questions

Above: the so-called "McClelland" drawing, purportedly depicting Kennedy's large head wound as observed at Parkland Hospital.

At left and above: Warren Commission Exhibits 386 and 388 respectively, purportedly depicting Kennedy's wounds as observed at Bethesda Naval Hospital.

If the "McClelland" drawing, at left, accurately reflects the location of Kennedy's head wound as determined by his emergency room doctors, then why did these doctors not only not object when the Warren Commission published exhibits showing a wound much higher on the skull, but subsequently defer to the accuracy of the autopsy photos, showing a wound even more forward?

Even if one were to argue that these doctors were intimidated into at first keeping silent, and then admitting a mistake, how can one expect future generations to trust the observations of witnesses who not only failed to act when they had the chance, but admitted they'd been wrong?

Statements and Questions

As one reads the following statements, one should keep in mind the manner in which these statements have been presented by conspiracy theorists of all stripe and color. In his 2006 book *The JFK*

Assassination Debates, historian Michael Kurtz relates that *"Every physician and nurse at Parkland Hospital who examined the President's head wounds described a large wound in the right rear of the head. In other words, they described a bullet wound of exit in the back of the head, which meant that the bullet came from in front of Kennedy because he faced forward. In their original descriptions of the wound in Kennedy's head, Dr.s Malcolm Perry, James Carrico, Robert McClelland, Paul Peters, Ronald Jones, and others clearly described a large wound of exit in the occipital region. In addition, they observed both cerebral and cerebellar tissue coming from the wound."*

This passage, then, implies that all the doctors and nurses saw the same thing: an exit wound in the occipital region oozing cerebellar tissue. Let us see, then, how many doctors, on the day of the assassination, actually claimed 1) the wound was in the occipital region, 2) this wound was an exit wound, and 3) they saw cerebellar tissue coming from this wound.

Appendix VIII - Medical Reports from Doctors at Parkland Memorial Hospital, Dallas, Texas

Commission Exhibit No. 392

The President arrived in the Emergency Room at exactly 12:43 p. m. in his limousine. He was in the back seat, Gov. Connally was in the front seat of the same car, Gov. Connally was brought out first and was put in room two. The President was brought out next and put in room one. Dr. Clark pronounced the President dead at 1 p. m. exactly. All of the President's belongings except his watch were given to the Secret Service. His watch was given to Mr. O. P. Wright. He left the Emergency Room, the President, at about 2 p.m. in an O'Neal ambulance. He was put in a bronze colored plastic casket after being wrapped in a blanket and was taken out of the hospital. He was removed from the hospital. The Gov. was taken from the Emergency Room to the Operating Room.

The President's wife refused to take off her bloody gloves, clothes. She did take a towel and wipe her face. She took her wedding ring off and placed it on one of the President's fingers.

Summary

The President arrived at the Emergency Room at 12:43 P. M., the 22nd of November, 1963. He was in the back seat of his limousine. Governor Connally of Texas was also in this car. The first physician to see the President was Dr. James Carrico, a Resident in General Surgery.

*Dr. Carrico noted the President to have slow, agonal respiratory efforts. He could hear a heartbeat but found no pulse or blood pressure to be present. Two external wounds, one in the lower third of the anterior neck, the other in the occipital region of the skull, were noted. **Through the head wound, blood and brain were extruding.** Dr. Carrico inserted a cuffed endotracheal tube. While doing so, he noted a ragged wound of the trachea immediately below the larynx.*

At this time, Dr. Malcolm Perry, Attending Surgeon, Dr. Charles Baxter, Attending Surgeon, and Dr. Ronald Jones, another Resident in General Surgery, arrived. Immediately thereafter, Dr. M. T. Jenkins, Director of the Department of Anesthesia, and Doctors Giesecke and Hunt, two other Staff Anesthesiologists, arrived. The endotracheal tube had been connected to a Bennett respirator to assist the President's breathing. An Anesthesia machine was substituted for this by Dr. Jenkins. Only 100% oxygen was administered.

A cutdown was performed in the right ankle, and a polyethylene catheter inserted in the vein. An infusion of lactated Ringer's solution was begun. Blood was drawn for type and crossmatch, but unmatched type "O" RH negative blood was immediately obtained and begun. Hydrocortisone 300 mgms was added to the intravenous fluids.

Dr. Robert McClelland, Attending Surgeon, arrived to help in the President's care. Doctors Perry, Baxter, and McClelland began a tracheostomy, as considerable quantities of blood were present from

the President's oral pharynx. At this time, Dr. Paul Peters, Attending Urological Surgeon, and Dr. Kemp Clark, Director of Neurological Surgery arrived. Because of the lacerated trachea, anterior chest tubes were placed in both pleural spaces. These were connected to sealed underwater drainage.

Neurological examination revealed the President's pupils to be widely dilated and fixed to light. His eyes were divergent, being deviated outward; a skew deviation from the horizontal was present. Not deep tendon reflexes or spontaneous movements were found.

There was a large wound in the right occipito-parietal region, from which profuse bleeding was occurring. 1500 cc. of blood were estimated on the drapes and floor of the Emergency Operating Room. There was considerable loss of scalp and bone tissue. Both cerebral and cerebellar tissue were extruding from the wound.

Further examination was not possible as cardiac arrest occurred at this point. Closed chest cardiac massage was begun by Dr. Clark. A pulse palpable in both the carotid and femoral arteries was obtained. Dr. Perry relieved on the cardiac massage while a cardiachioscope was connected. Dr. Fouad Bashour, Attending Physician, arrived as this was being connected. There was electrical silence of the President's heart.

President Kennedy was pronounced dead at 1300 hours by Dr. Clark.

Kemp Clark, M. D.

Director

Service of Neurological Surgery

KC:aa

cc to Dean's Office, Southwestern Medical School

cc to Medical Records, Parkland Memorial Hospital

(Note: this summary was written by Dr. Clark. Here he describes the head wound as right occipito-parietal, which would place it above and behind the right ear. As no notes were taken in the ER, however, it seems clear Dr. Clark was relying solely on his memory of a wound seen hours before. As a result, it is not unreasonable to suspect he made a rotation error.)

PARKLAND MEMORIAL HOSPITAL

ADMISSION NOTE

J. F. KENNEDY

DATE AND HOUR 11/22/63 1620

DOCTOR: Carrico

*When patient entered Emergency room on ambulance carriage had slow agonal respiratory efforts and scant cardiac beats by auscultation. Two external wounds were noted. One small penetrating wound of ant. neck in lower 1/3. **The other wound had avulsed the calvarium and shredded brain tissue present with profuse oozing.** No pulse or blood pressure were present. Pupils were dilated and fixed. A cuffed endotracheal tube was inserted and through the laryngoscope a ragged wound of the trachea was seen immediately below the larynx. The tube was passed past the laceration and the cuff inflated.*

Respiration using the resp assistor on auto-matic were instituted. Concurrently an IV infusion of lactated Ringer solution was begun via catheter placed in right leg and blood was drawn for type and crossmatch. Type O Rh negative blood was obtained as well as hydrocortisone.

In view of tracheal injury and decreased BS a tracheostomy was performed by Dr. Perry and Bilat. chest tubes inserted. A 2nd bld infusion was begun in left arm. In addition Dr. Jenkins began resp with

*anesthesia machine, cardiac monitor, and stimulator attached. Solu cortef IV given (300mg), **attempt to control slow oozing from cerebral and cerebellar tissue via packs instituted.** Despite these measures as well as external cardiac massage, BP never returned and EKG evidence of cardiac activity was never obtained.*

Charles J. Carrico M.D

(Note: Dr. Carrico was the first doctor on the scene. Here he fails to specify the exact location of the head wound. But, on 3-25-64 he told the Warren Commission that *"The wound that I saw was a large gaping wound, located in the right occipitoparietal area. I would estimate to be about 5 to 7 cm. in size more or less circular, with avulsions of the calvarium and scalp tissue. As I stated before, I believe there was shredded macerated cerebral and cerebellar tissues both in the wounds and on the fragments of the skull attached to the dura."* This supports his original report. An occipitoparietal wound, of course, suggests a wound higher on the skull than the wound in the "McClelland" drawing, which is almost entirely occipital. It should come as no surprise then that Carrico would later make statements suggesting that the wound was chiefly a parietal wound, above the ear. In 1981, when shown the HSCA's tracing of an autopsy photo by a reporter for The Boston Globe, for example, he said that the official autopsy photograph showed *'nothing incompatible'* with what he remembered of the back of the head. After viewing the autopsy photos in the archives in 1988, moreover, he disavowed his earlier references to occipital and cerebellar damage, insisted he'd been mistaken, and declared instead that Kennedy's wounds were as shown in the photos. And this wasn't just him caving in for a TV documentary, mind you. A 5-27-92 article in the Journal of the American Medical Association quoted Carrico as claiming, *"Nothing we observed contradicts the autopsy finding that the bullets were fired from above and behind by a high-powered rifle."* And, should this not be clear enough, a 6-6-92 article in the Dallas Morning News reported that Dr. Carrico, along with fellow Parkland "witnesses" Drs Baxter, Jenkins, and Peters, attended a forum on Kennedy's wounds sponsored by the Dallas Council on World Affairs, and that Carrico told those in attendance he'd never actually seen Kennedy's cerebellum, but had confused cerebrum for cerebellum *"in part because the brain was so mangled by the bullet."* Writer Harrison Livingstone, for his 1993 book Killing The Truth, obtained a tape of Carrico's comments, and quoted him as follows: *"If I had to testify again today...I would correct or at least be far less definite about seeing cerebellum. We saw significantly destroyed brain and we thought it was cerebrum and cerebellum. I'm not at all sure we saw cerebellum."*

Kurtz score: Carrico does not describe the location of the wound in his original report, although its location can be inferred from his reference to cerebellum. He does not, however, describe this wound as a wound of exit. Kurtz's summary of Carrico's statement is therefore **accurate on 2 of 3 points.**

Somewhat misleading.)

PARKLAND MEMORIAL HOSPITAL

ADMISSION NOTE

J. F. KENNEDY

DATE AND HOUR 22 Nov 1963 DOCTOR: PERRY

Staff Note

*At the time of initial examination, the pt. was noted as non-responsive. The eyes were deviated and the pupils were dilated. A considerable quantity of blood was noted on the patient, the carriage and the floor. A small wound was noted in the midline of the neck, in the lower third anteriorly. It was exuding blood slowly. **A large wound of the right posterior cranium was noted, exposing severely lacerated brain. Brain tissue was noted in the blood at the head of the carriage.***

Pulse or heartbeat were not detectable but slow spasmodic respiration was noted. An endotracheal tube was in place and respiration was being assisted. An intravenous infusion was being placed in the leg.

At this point I noted that respiration was ineffective and while additional venisections were done to administer fluids and blood, a tracheostomy was effected. A right lateral injury to the trachea was noted. The tracheostomy tube was put in place and the cuff inflated and respiration assisted. Closed chest cardiac massage was instituted after placement of sealed drainage chest tubes, but without benefit. Electrocardiographic evaluation revealed that no detectable electrical activity existed in the heart. Resuscitation attempts were abandoned after the team of physicians determined that the patient had expired.

Malcolm O. Perry, M.D.

1630 hr 22 Nov 1963

(Note: Perry simply describes the large head wound as posterior. Within a few days of the shooting, Dr. Perry was the source for an article by Jimmy Breslin in the New York Herald-Tribune which was not so vague, claiming *"The occipito-parietal, which is a part of the back of the head, had a huge flap."* This flap, of course, is readily apparent on the autopsy photos but is nowhere to be seen on the "McClelland" drawing purported to represent the wound as seen by Perry. When testifying before the Warren Commission's attorneys on 3-25-64, for that matter, Perry would further describe the wound as being both in the *"right posterior parietal area of the head exposing lacerated brain"* and as a *"large avulsive injury of the right occipitoparietal area."* On 3-31-64, when testifying before the Commission itself, he would again describe the wound as *"a large avulsive wound of the right parietal occipital area, in which both scalp and portions of skull were absent"* with *"severe laceration of underlying brain tissue."* The wound described was, no surprise, higher on the skull than the wound depicted in the "McClelland" drawing. While Dr. Perry told the HSCA's Andy Purdy in 1978 that *"some cerebellum"* was seen, moreover, he either changed his mind about this or was referring to what someone else claimed to see, as he was reported to have told Gerald Posner in 1992 that he'd never actually seen cerebellum. In support that he'd actually told Posner such a thing, an article in the 4-5-92 Ft. Worth Star-Telegram had Perry rejecting Dr. Charles Crenshaw's assertion Kennedy was shot from the front; it quoted him as claiming *"There were no wounds at the front of the head at all."* It also had Perry claiming that most of the doctors who'd seen Kennedy at Parkland failed to talk much about the shooting not because they'd been silenced, but because it was *"a painful experience most of us don't want to relive."* This, in turn, led to a 5-27-92 article in the Journal of the American Medical Association, in which Dr. Perry further denounced Dr. Crenshaw and his belief Kennedy was shot from the front. This time he went a bit further, however. To counter Crenshaw's claim that his fellow Parkland physicians, including Perry, had participated in a *"conspiracy of silence"* about Kennedy's wounds, in order to save their careers, Perry responded by saying that, if Dr. Crenshaw had truly felt Kennedy's wounds were evidence of a conspiracy, and had kept his silence for 29 years, then that was *"despicable."* In 1997, in a letter to single-assassin theorist Francois Carlier, subsequently posted online, moreover, Perry made his total rejection of the conspiracy theorist claim Kennedy's head wound was on the back of the head at Parkland, but on the top of the head at Bethesda, crystal freaking clear. When asked by Carlier if he was familiar with David Lifton's theory the body was kidnapped and altered, Perry responded *"I didn't know this--what a joke!"* When then asked what he thought of Lifton's theory, he responded *"Don't know or care what he says. He wasn't there."* And it's not as if Perry was just telling Carlier what he wanted to hear. When, in 1998, conspiracy theorist Vincent Palamara similarly pushed Perry for clarification on Kennedy's wounds, Perry wrote him back and insisted he'd made *"only a cursory examination of the head"* and that both his findings and those of his colleague Dr. Clark were *"consistent with those described by Dr. Humes et al during the autopsy."* Yes,

it's more than clear. Perry, as Carrico, felt the wounds he saw at Parkland were consistent with the wounds observed at Bethesda. He was not a conspiracy theorist. And conspiracy theorists should stop pretending he was.

Kurtz score: Perry does not mention the occipital bone, nor cerebellum, in his original report. Nor does he describe the wound as a wound of exit. In fact, in the initial press conference in which Kennedy's wounds were discussed, Perry said "The nature of the wound defies the ability to describe whether it went through it from either side." Kurtz's summary therefore is **inaccurate on all 3 points. Misleading.)**

PARKLAND MEMORIAL HOSPITAL

ADMISSION NOTE

DATE AND HOUR NOV 22, 1963 DOCTOR: BAXTER

Note of Attendance to President Kennedy

*I was contacted at approx 12:40 that the President was on the way to the emergency room having been shot. On arrival there, I found an endotracheal tube in place with assisted respirations, a left chest tube being inserted and cut downs going in one leg and in the left arm. The President had a wound in the mid-line of the neck. **On first observation of the remaining wounds the rt temporal and occipital bones were missing and the brain was lying on the table, with extensive lacerations and contusions.** The pupils were fixed and deviated lateral and dilated. No pulse was detectable and respirations were (as noted) being supplied. A tracheotomy was performed by Dr. Perry and I and a chest tube inserted into the right chest (2nd intercostal space anteriorly). Meanwhile, 2 pts of O neg blood were administered by pump without response. When all of these measures were complete, no heart beat could be detected. Closed chest massage was performed until a cardioscope could be attached which revealed no cardiac activity was obtained. **Due to the excessive and irreparable brain damage which was lethal,** no further attempt to resuscitate the heart was made.*

*Charles R. Baxter M.D.
Associate Prof of Surgery
Southwestern Medical School*

(Note: Baxter's statement is a bit strange. If "the rt temporal and occipital bones were missing", as Baxter claimed, there would be a huge hole on the side and back of Kennedy's head. Perhaps then, he meant only that parts of the temporal and occipital bones were missing. Baxter's testimony is even more intriguing. When he testified before the Warren Commission, at a time long before anyone was talking about the difference in the wound descriptions of those viewing Kennedy in Parkland and Bethesda, he testified that he observed a "*temporal parietal plate of bone laid outward to the side,*" and that "*the right side of his head had been blown off.*" He was also asked to read his earlier report into the record. While doing so, however, he read the line "*the rt temporal and occipital bones were missing*" as the "*temporal and parietal bones were missing.*" This, in effect, moved the wound from the side and back of the skull, to the side and top of the skull. Now, while some might claim he was pressured into doing so by Warren Commission Counsel Arlen Specter, who took his testimony, this seems a bit far-fetched seeing as none of the other doctors recalled receiving any similar pressure regarding their own descriptions of the head wound. The probability, then, is that Baxter was "correcting" his earlier statement on his own. If so, then he was relatively consistent from that point onward. In 1992 alone, he is reported to have told writer Gerald Posner that "*The wound was on the right side, not the back,*" to have told a writer for the Journal of the American Medical Association that he defers to the findings of the autopsy report, and to have told Tom Jarriel on the news program 20/20 that it was impossible to

tell the direction of the bullet from what he observed. He would eventually tell the ARRB, while sitting with some of his fellow Parkland witnesses, that *"None of us at that time, I don't think, were in any position to view the head injury. And, in fact, I never saw anything above the scalpline, forehead line, that I could comment on."* And should that seem too clear, Baxter wrote single-assassin theorist Francois Carlier in 1997 and once again revealed his confusion. While answering a series of questions (the same questions Carlier asked Perry) Baxter told Carlier both that the wound was in the "occiput" and that his initial suspicion was that the shot came *"from the rear."* He then clarified his position, forevermore, by insisting that Lifton's theory the wounds were altered was *"Bull!"* Now, that's three for three. Three Parkland doctors. Three men who failed to believe the wounds they saw indicated Kennedy was shot from the front.

Well, that settles it. While David Lifton, in the 2011 forum post cited in chapter 18c, presented Baxter as one of two Parkland witnesses suggesting the head wound was low on the back of the head, and that the Harper fragment was occipital bone, it's clear Baxter, based on his testimony and subsequent statements, would NEVER agree to such nonsense. As Dr. Paul Peters, the other doctor cited by Lifton, repeatedly pointed out the location of the wound at points higher than the occipital bone (as shown in *The Men Who Killed Kennedy*, [here](#)), it's clear Lifton has carefully selected statements and testimony to convince himself of something that the people making these statements never believed was true. While all researchers willing to think outside the box, including this one, are at risk to wind up in this position, it is at least a wee bit hypocritical for Lifton to claim *"the primacy and importance of the Dallas doctors observations cannot be overemphasized,"* while ignoring observations, such as Baxter's observation of a 'temporal parietal plate of bone laid outward to the side,' and demonstrations, such as Peters' demonstration of the wound location, that contradict his theory.

Kurtz score: by his inclusion of the temporal bone, it is clear Baxter was describing a wound on the side of the head, not the rear of the head. While he mentioned cerebellum in his 3-24-64 testimony, he made no mention of cerebellum oozing from the wound in his original report, nor that this wound was an exit wound. Kurtz's summary of Baxter's statements therefore is **inaccurate on all 3 points.**

Misleading.)

DATE AND HOUR 22 Nov 1963

12:20pm to 13:00 hrs

*Called by EOR while standing in (illegible) Laboratory at SWMS. Told that the President had been shot. I arrived at the EOR at 1220 - 1225 ~~and~~ .The President was **bleeding profusely from the back of the head. There was a large (3 x 3cm) amount of cerebral tissue present on the cart. There was a smaller amount of cerebellar tissue present also.***

A tracheostomy was being performed by Drs. Perry, Baxter and McClelland. Exam of the President showed that an endotracheal tube was in place and respiratory assistance was being given by Dr. Akins and Jenkins. The pupils were dilated, fixed to light and his eyes were deviated outward and the right one downward as as well .

The trach was completed and I adjusted the endotracheal tube a little bit. Blood was present in the oral pharynx. Suction was used to remove this. Levine Catheter was passed into the stomach at this time.

He was (illegible) that I (illegible) no carotid pulse. I immediately began closed chest massage. A pulse was obtained at the carotid and femoral pulse levels.

Dr. Perry then took over the cardiac massage so I could evaluate the head wound.

There was a large wound beginning in the right occiput extending into the parietal region. Much of the skull appeared gone at brief examination. The previously described lacerated brain was present.

By this time an EKG was hooked up. There was no electrical activity of the heart and no respiratory effort - He was pronounced dead at 1300 hrs by me.

W. Kemp Clark

22 Nov 1963 1615 hrs -

(Note: although Clark describes cerebral and cerebellar tissue on the cart, a number of his colleagues would subsequently come to claim that macerated brain tissue is difficult to distinguish from cerebellar tissue, and that he, as they, could have been mistaken. His statement that "much of the skull appeared gone" is problematic, moreover, for those who try to make the Dallas doctors' descriptions of a wound on the back of the head jive with the Zapruder film and autopsy photos' depiction of a wound on top of the head by speculating that the Dallas doctors did not see the large head wound on top of the head because Mrs. Kennedy had put the bones back in place, and that they instead saw the posterior aspect of this wound behind the ear, which was not recorded in the autopsy photos due to the autopsists' closing of the bone flaps on back of the head. Clark claimed to see a large hole in the skull, and not a hole beneath some bone flaps. This means that either the large head wound was on the top of the head and Clark was mistaken as to its exact location, or it was on the back of the head as described by Clark and the Zapruder film and autopsy photos have been faked. I select the first alternative.

Clark's March 21, 1964 testimony for the Warren Commission offers some support for this selection. He testified: "I then examined the wound in the back of the President's head. This was a large, gaping wound in the right posterior part, with cerebral and cerebellar tissue being damaged and exposed." Later, however, when Warren Commission Counsel Arlen Specter referred to this wound as a wound "at the top of the head," and asked if Clark saw any other wounds, he replied "No sir, I did not." When then asked if his recollections were in conflict with the autopsy report's description of an entrance wound slightly above and an inch to the right of the EOP, he replied "Yes, in the presence of this much destruction of skull and scalp above such a wound and lateral to it and the brief period of time available for examination--yes, such a wound could be present." He had thereby claimed the wound he examined was *entirely* above the EOP, and more than an inch to its right. Well, this would be well above and to the right of where so many theorists propose the wound to have been located. It would, in fact, rule out the Harper fragment's being occipital bone. Clark was then asked if his observations were consistent with the autopsy report's conclusion of a bullet entering near the EOP, and "exiting from the center of the President's skull." He replied: "Yes, sir." When brought back four days later, and asked about a February 20 article in the French paper L'Express, where it was claimed he'd told the New York Times the first bullet entered at the knot of Kennedy's tie and penetrated Kennedy's chest, and that the second bullet hit "the right side of his head" and caused a "tangential" wound of both entrance and exit, furthermore, Clark disagreed with its characterization of his statements regarding the first bullet, but said nothing about its characterization of the second. In sum, then, while Clark's report and testimony suggest he saw a wound on the back of the head, a closer look at his testimony shows he was agreeable that this wound was at the top right side of the head, and consistent with the wound described in the autopsy report.

While some might take from this that Clark had sold out, and had testified in opposition to his original report, they would be undoubtedly wrong to do so. Before writing his report, we should remember, Clark had spoken to the press...twice. In the official press conference, he had claimed the wound was "principally on the right side." While speaking to Connie Kritzberg, about an hour later, moreover, he reiterated that it was on the 'right rear side.' He had never claimed, nor would ever claim, the wound was on the far back of the head, below the top of the ear, in the location depicted in the "McClelland" drawing. This was something many had assumed based upon his mention of cerebellum. But it was

never supported by the sum total of his statements.

While some have taken Clark's post 1964 silence as confirmation he believed the fatal shot exited from the far back of Kennedy's head, furthermore, a more complete look at the record suggests otherwise. A November 22, 1983 UPI article (found in the Ellensburg Daily Record) boasts an interview with Clark, and he claims "The only regret I have is that I'm constantly bothered by a bunch of damn fools who want me to make some kind of controversial statement about what I saw, what was done, or that he is still alive here on the 12th floor of Parkland Hospital or some foolish thing like that. Since these guys are making their money by writing this kind of provocative books, it annoys me, frankly." This was, strikingly, less than a year after Clark at first expressed interest in looking at the autopsy photos in David Lifton's possession, and then refused to even open the envelope containing these photos when Lifton arrived at his office. This was, just as strikingly, more than a decade after Clark first consulted with single-assassin theorist John Lattimer, and helped Lattimer develop a scientific and "innocent" explanation for Kennedy's back-and-to-the-left movement in the Zapruder film. It follows, then, that Clark was no friend of conspiracy theorists, and that he'd picked his side on the matter--the side in which Oswald acted alone. Well, for me, it's hard to believe he'd have done this if he'd actually felt certain Kennedy's head wound was an occipital wound oozing cerebellum. But the reader may wish to think otherwise.

Kurtz score: by mentioning the parietal bone, Clark was describing a wound higher on the skull than the one implied by Kurtz, and depicted in the McClelland drawing. Even so, Clark does mention the occipital bone, and the oozing of cerebellar tissue from the wound. He does not, however, describe the wound as a wound of exit. In fact, Clark, a man from whom all the other doctors would take their cue, made clear in the initial press conference that the wound could be either an exit for a shot fired from the front OR a wound of both entrance and exit for a shot fired from the rear. Kurtz's summary of Clark's statement, then, is **accurate on 2 of 3 points. Somewhat misleading.**)

PARKLAND MEMORIAL HOSPITAL

ADMISSION NOTE

DATE AND HOUR Nov. 22, 1963 4:45 P.M. *DOCTOR:* Robert N. McClelland

Statement Regarding Assassination of President Kennedy

*At approximately 12:45 PM on the above date I was called from the second floor of Parkland Hospital and went immediately to the Emergency Operating Room. When I arrived President Kennedy was being attended by Drs Malcolm Perry, Charles Baxter, James Carrico, and Ronald Jones. The President was at the time comatose from a **massive gunshot wound of the head** with a fragment wound of the trachea. An endotracheal tube and assisted respiration was started immediately by Dr. Carrico on Duty in the EOR when the President arrived. Drs. Perry, Baxter, and I then performed a tracheotomy for respiratory distress and tracheal injury and Dr. Jones and Paul Peters inserted bilateral anterior chest tubes for pneumothoraxis secondary to the tracheomediastinal injury. Simultaneously Dr. Jones had started 3 cut-downs giving blood and fluids immediately, In spite of this, at 12:55 he was pronounced dead by Dr. Kemp Clark the neurosurgeon and professor of neurosurgery who arrived immediately after I did. **The cause of death was due to massive head and brain injury from a gunshot wound of the left temple.** He was pronounced dead after external cardiac massage failed and ECG activity was gone.*

Robert N. McClelland M.D.
*Asst. Prof. of Surgery
Southwestern Med.*

(Note: in this, his earliest statement on the assassination, Dr. McClelland reveals that he was easily confused and prone to speculation. First of all, he gets himself all turned around and mistakenly says there was a wound in the left temple. He says nothing of a wound on the back of the head or behind the ear. As but one head wound was noted at Parkland, and as no competent doctor would mention a wound he did not see while failing to mention the one he did, it seems probable McClelland meant to say this wound was of the right temple, not left. Second of all, he states, without offering any supporting evidence, that the throat wound was a fragment wound. This shows he was prone to speculation.

In light of the fact many conspiracy theorists cite McClelland as the most reliable of the Parkland witnesses, McClelland's next statements are even more intriguing. McClelland was the prime source for the 12-18-63 article by Richard Dudman published in the St. Louis Post-Dispatch, in which the Secret Service's visit to the Parkland doctors, and its attempt to get them to agree Kennedy's throat wound was an exit, was first revealed. And yet McClelland told Dudman that after being told of the wound on Kennedy's back *"he and Dr. Perry fully accept the Navy Hospital's explanation of the course of the bullets."* And yet he told Dudman *"I am fully satisfied that the two bullets that hit him were from behind."* And yet he told Dudman *"As far as I am concerned, there is no reason to suspect that any shots came from the front."* Repeat...NO reason to suspect *any* shots came from the front... That's right...in the very article most conspiracy theorists believe first exposed the government's cover-up of Kennedy's wounds, Dr. McClelland, the man they consider the most credible of the Parkland witnesses, spelled out--and made CRYSTAL CLEAR--that he did not think the large head wound he observed was an exit wound on the far back of the head.

This is confirmed yet again by the first article on the wounds published in a medical journal. Three Patients at Parkland, published in the January 1964 Texas State Journal of Medicine, was based upon the Parkland doctors' 11-22 reports, and repeated their descriptions of Kennedy's wounds and treatment word for word. Well, almost. In one of its few deviations, it changed Dr. McClelland's initial claim Kennedy was pronounced dead "at 12:55" to his being "pronounced dead at 1:00." This was an obvious correction of an innocent mistake. In what one can only assume was another correction of an innocent mistake, moreover, it re-routed Dr. McClelland's initial claim *"The cause of death was due to massive head and brain injury from a gunshot wound of the left temple"* to the more acceptable *"The cause of death, according to Dr. McClelland was the massive head and brain injury from a gunshot wound of the right side of the head."* Right side of the head. Not back of the head. While some might wish to believe the writer and/or editor of this article took it upon himself to make this change without consulting Dr. McClelland, and that he'd changed it to fit the "official" story, the fact of the matter is there was NO official story on the head wounds at this point, beyond the descriptions of the wound in the reports of McClelland's colleagues published elsewhere in the article. And these, in sum, described a wound on the back of the head. It seems likely, then, that McClelland himself was responsible for this change.

In any event, on March 21, 1964, Dr. McClelland, testified before the Warren Commission. In contrast to his earlier statements, he now claimed: *"As I took the position at the head of the table that I have already described, to help out with the tracheotomy, I was in such a position that I could very closely examine the head wound, and I noted that the right posterior portion of the skull had been extremely blasted. It had been shattered ... the parietal bone was protruded up through the scalp and seemed to be fractured almost along its right posterior half, as well as some of the occipital bone being fractured in its lateral half, and this sprung open the bones that I mentioned in such a way that you could actually look down into the skull cavity itself and see that probably a third or so, at least, of the brain tissue, posterior cerebral tissue and some of the cerebellar tissue had been blasted out."*

Since Kennedy was by all reports lying on his back, it is impossible to understand how McClelland could look down into a wound on the back of Kennedy's head. It seems likely then that McClelland, as Clark, was confused by the rotation of Kennedy's skull.

And it seems just as likely McClelland is not the man many if not most conspiracy theorists assume him to be. Notes on a 12-1-71 interview of McClelland by researcher Harold Weisberg reveal that McClelland *"volunteered at some length about Garrison's men, describing Garrison as a psychopath, and seemed proud that he had talked them out of calling him as a witness...McC was quite bitter about Garrison and Lane, but he was without complaint about Specter and the Warren Commission..."*

So there it is. Dr. Robert McClelland--whom many conspiracy theorists believe an unshakeable truth-teller--was a supporter of the Warren Commission's for years and years after the assassination--to such an extent even that he refused to cooperate with Jim Garrison's attempts to re-open the case. Well, is it any wonder then that McClelland, while continuing to insist he saw a wound on the back of Kennedy's head, repeatedly defended the legitimacy of the autopsy photos? And that he told the producers of the television show Nova in 1988 that *"I find no discrepancy between the wounds as they're shown very vividly in these photographs and what I remember very vividly?"* And is it any wonder then that in both his Nova appearance and ARRB testimony McClelland ventured that the back of the head photo depicts sagging scalp pulled over a large occipito-parietal wound? I mean, the man clearly has problems separating fact from fiction. (McClelland's assertion a large hole on the back of Kennedy's head could be covered up by stretched scalp is, of course, utterly fantastic and unsupported by every book on wound ballistics I have ever come across. Scalp overlying explosive wounds to the skull does not stretch and sag, it tears. No such tears were noted on the back of Kennedy's head at autopsy, and none are shown in the autopsy photos whose legitimacy McClelland defends.)

Kurtz score: McClelland's original statement said none of the things Kurtz claims it did. Kurtz's summary of McClelland's statement is therefore **inaccurate on all 3 points. Misleading.)**

PARKLAND MEMORIAL HOSPITAL

ADMISSION NOTE

DATE AND HOUR Nov. 22, 1963 4:45 P.M. *DOCTOR:* BASHOUR

Statement Regarding Assassination of the President of the U.S.A., President Kennedy At 12:50 PM, we were called from the 1st floor of Parkland Hospital and told that President Kennedy was shot. Dr. D ?? and myself went to the emergency room of Parkland. Upon examination, the President had no pulsation, no heartbeat, no blood pressure. The oscilloscope showed a complete standstill. The president was declared dead at 12:55 P.M.

F. Bashour M.D.

*Associate Professor of Cardiology
Southwestern Medical School Dallas, Texas.*

(Note: there is not much to say about Dr. Bashour's report. His Warren Commission testimony, in which he described the head wound as "massive," is not much better. But the next statement, in my analysis, holds the key.)

*THE UNIVERSITY OF TEXAS SOUTHWESTERN MEDICAL SCHOOL, DALLAS
November 22, 1963 1630*

To: Mr. C. J. Price, Administrator Parkland Memorial Hospital

From: M. T. Jenkins, M.D., Professor and Chairman Department of Anesthesiology

Subject: Statement concerning resuscitative efforts for President John F. Kennedy

Upon receiving a stat alarm that this distinguished patient was being brought to the emergency room at Parkland Memorial Hospital, I dispatched Doctors A. H. Giesecke and Jackie H. Hunt with an anesthesia machine and resuscitative equipment to the major surgical emergency room area, and I ran down the stairs. On my arrival in the emergency operating room at approximately 1230 I found that Doctors Carrico and/or Delaney had begun resuscitative efforts by introducing an orotracheal tube, connecting it for controlled ventilation to a Bennett intermittent positive pressure breathing apparatus. Doctors Charles Baxter, Malcolm Perry, and Robert McClelland arrived at the same time and began a tracheostomy and started the insertion of a right chest tube, since there was also obvious tracheal and chest damage. Doctors Paul Peters and Kemp Clark arrived simultaneously and immediately thereafter assisted respectively with the insertion of the right chest tube and with manual closed chest cardiac compression to assure circulation.

For better control of artificial ventilation, I exchanged the intermittent positive pressure breathing apparatus for an anesthesia machine and continued artificial ventilation. Doctors Gene Akin and A. H. Giesecke assisted with the respiratory problems incident to changing from the orotracheal tube to a tracheostomy tube and Doctors Hunt and Giesecke connected a cardioscope to determine cardiac activity.

During the progress of these activities, the emergency room cart was elevated at the feet in order to provide a Trendelenburg position, a venous cutdown was performed on the right saphenous vein, and additional fluids were begun in a vein in the left forearm while blood was ordered from the blood bank. All of these activities were completed by approximately 1245, at which time external cardiac massage was still being carried out effectively by Doctor Clark as judged by a palpable peripheral pulse. Despite these measures there was no electrocardiographic evidence of cardiac activity.

*These described resuscitative activities were indicated as of first importance, and after they were carried out attention was turned to all other evidences of injury. **There was a great laceration on the right side of the head (temporal and occipital), causing a great defect in the skull plate so that there was herniation and laceration of great areas of the brain, even to the extent that the cerebellum had protruded from the wound.** There were also fragmented sections of brain on the drapes of the emergency room cart. With the institution of adequate cardiac compression, there was a great flow of blood from the cranial cavity, indicating that there was much vascular damage as well as brain tissue damage.*

It is my personal feeling that all methods of resuscitation were instituted expeditiously and efficiently. However, this cranial and intracranial damage was of such magnitude as to cause the irreversible damage. President Kennedy was pronounced dead at 1300.

Sincerely, M. T. Jenkins, M.D.

The Trendelenburg Position

Above: a Groden autopsy photo, tilted to match the photo below. Notice that the large wound is in a similar relation to the ear as the wound in the McClelland drawing.

Above: the McClelland drawing, depicting the wound as recalled by the Parkland witnesses.

Above: an online depiction of the Trendelenburg Position.

Above: an online depiction of the Trendelenburg position. Would a doctor standing at the head of a patient in such a position be able to look down into the wound depicted in the McClelland drawing? Or would he be more likely to confuse the large wound in the autopsy photo at top left with a wound on the back of the head?

The Trendelenburg Position

At first glance, Dr. Jenkins' statement is not particularly eye-opening. As with Baxter, he describes the wound as "*temporal and occipital*." As with Clark he makes sure we know there is missing bone, describing "*a great defect in the skull plate*" incompatible with the "sprung-bone theory" so popular with so many conspiracy theorists and later pushed by McClelland.

But that's just the beginning of Jenkins's journey. Although an 11-10-77 report on an interview with Jenkins conducted by the HSCA staff specified that "*Dr. Jenkins said that only one segment of bone was blown out--it was a segment of occipital or temporal bone*" and that "*a portion of the cerebellum (lower rear brain) was hanging out*," he was soon thereafter shown the error of his ways (apparently by Dr. Lattimer), as a 3-4-81 transcript of an interview with the Boston Globe found in the Weisberg Archives has him saying both that the wound was "*above the ear, parietal...about the size of the palm of your hand*" and that he knew he hadn't actually seen cerebellum.

He continued in this vein ever after. In 1988, he told the producers of the television program NOVA that, upon finally viewing the autopsy photos, he'd come to believe his earliest descriptions of the wound location were incorrect, and that he did not see cerebellum protruding from the large defect. Four years later, in the 5-27-92 issue of the Journal of the American Medical Association, moreover, he would reiterate this position, not only questioning his original descriptions of Kennedy's head wounds but those of his fellow Parkland witnesses. He declared: "*I was standing at the head of the table... My presence there and the President's great shock of hair and the location of the head wound were such that it was not visible to those standing down each side of the gurney where they were carrying out*

their resuscitative maneuvers."

And he didn't stop there. In 1992, in what was apparently a busy year for Jenkins, he is reported to have told writer Gerald Posner that *"The description of the cerebellum was my fault... When I read my report over I realized there could not be any cerebellum. The autopsy photo, with the rear of the head intact and a protrusion in the parietal region, is the way I remember it. I never did say occipital."* (Oh yes, you did.) A 6-6-92 article in the Dallas Morning News, reporting on a Dallas Forum on Kennedy's wounds, moreover, further claimed that Jenkins, along with Drs Carrico and Peters, had told those in attendance that they'd confused cerebrum for cerebellum *"in part because the brain was so mangled by the bullet."* Jenkins' exact words were printed in Harrison Livingstone's *Killing the Truth* the next year. He'd told the audience *"In my official report, I said the cerebellum was hanging out, and I thought it over after I turned it in. Well, I confused my three lums at times. I'd call one by the other one's name. I'd call cerebrum cerebellum. When I looked at the photographs again, I can see why we did that, because this coming out of the temporal-parietal area, brain was so convoluted right there, that the cerebrum had a cerebellum look. But it wasn't cerebellum..."*

Jenkins was thus not only not a back-of-the-head witness, as many claim, but an ardent defender of the authenticity of the autopsy photos.

Almost hidden in Jenkins' November 22, 1963 statement, however, is something which convinces me that my speculation on why so many of the witnesses made the same mistake is not just reasonable, but absolutely correct. When discussing Kennedy's early treatment, he reports: *"During the progress of these activities, the emergency room cart was elevated at the feet in order to provide a Trendelenburg position."*

I looked up the term "Trendelenburg Position", and found this description: "In the **Trendelenburg position** the body is laid flat on the back with the head lower than the pelvis in contrast to the reverse Trendelenburg position. This is a standard position used in surgery in gynecology. It allows better access to the pelvic organs as intestines move cranially by gravity. It was named for the German surgeon Friedrich Trendelenburg." Elsewhere, I found an even better description: "Tren·de·len·burg position *n.* A supine position with the patient inclined at an angle of 45 degrees; so that the pelvis is higher than the head, used during and after operations in the pelvis or for shock."

Well, this surprised me, as no one else had mentioned that Kennedy was not only flat on his back, but topsy-turvy. Perhaps they'd simply forgotten. If so, it may not have occurred to them that a wound on the top of the head slightly in front of the ear would appear posterior to the ear if the patient was in the Trendelenburg position. This problem with orientation, moreover, would help explain how Dr. Robert McClelland could testify he *"could actually look down into the skull cavity itself"* whilst simultaneously embracing the contradictory attitudes that the wound was on the back of Kennedy's head and that Kennedy was lying on his back. It would also be consistent with Dr. Ronald Jones' statements to researcher Brad Parker in 1992, where he is reported to have claimed both that the wound was behind Kennedy's right ear and that *"a lot of that injury was on the downside with him flat on the table."* It seems more than a coincidence, after all, that if the wound was on top of Kennedy's skull, as presumed, while Kennedy was in the Trendelenburg Position, as claimed by Jenkins, the wound would have been observed as claimed by McClelland, and would appear to have been behind Kennedy's right ear, on the downside, as claimed by Jones.

(FWIW, in 1981, in an interview with the Boston Globe, Dr. Paul Peters claimed *"the President was lying in the supine, slight Trendelenburg position,"* which both confirmed Jenkins' report and challenged it, in that it suggested Kennedy's feet were not raised as much as they would be if he were in the normal Trendelenburg position.)

Should one still be skeptical that the confusion over the location of Kennedy's head wound came from the rotation of his body when observed by the doctors, however, one should feel free to go back to the Lincoln/Kennedy comparison slide [here](#) , and take a closer look at the locations of the red stars over President Lincoln.

(In September 2008, I put this slide up on an online forum, and asked if anyone noticed anything. After a few days passed, and no one responded, I offered the hint that there was something odd about the red stars I'd placed on the images of President Lincoln. Finally, after more than 500 views, a member offered that the red stars were not in the same location on the images of Lincoln, and that one was above Lincoln's ear, and the other was on the back of his head. That it took so long for someone to state something so obvious, once one compares the red stars to the top of the ear, supports my suspicion that the majority of those viewing this slide did not perceive the red stars in relation to the top of the ear, but to the middle of the ear. This, in turn, supports my suspicion that the Parkland witnesses were similarly confused.)

"Well, hold on right there," you must be thinking, "is it really likely *every* doctor seeing Kennedy at the hospital on 11-22 would make this same mistake, and confuse a wound high on the head above the ear with a wound on the back of the head oozing cerebellum?" No, probably not. Which is why it's important to recall that *every* doctor didn't. As discussed, Dr. Burkley was aware of but one wound on Kennedy's head, a large wound by his temple. As far as the Parkland staff, well, Dr. Baxter testified before the Warren Commission that the wound was temporal and parietal, and thus near the ear, and not on the back of the head. Dr. Salyer, as well, testified that the wound was in the "right temporal area," and thus near the ear, and not on the back of the head. While Dr. Giesecke testified before the Commission that the wound was on the left side of the head, he also claimed that it was a large wound stretching from the vertex to the ear, and the brow-line to the occiput, and thus not the hole on the back of the head recalled by others. In fact, he later admitted to Vincent Palamara that although he *"did not examine the President's head and should never have said anything about the wounds,"* he had nevertheless concluded *"all entrance wounds were from the rear."*

And then there's the Johnny-come-latelys--doctors only marginally involved in Kennedy's treatment whose statements regarding the head wound location came many years later... While Dr. Don Curtis did in fact testify before the Warren Commission his recollection as to the head wound location was not recorded till many years later, when he at first told researcher Brad Parker the "McClelland" drawing was *"essentially"* correct, and then specified to researcher Vincent Palamara that the wound was on the *"posterior lateral surface of the skull,"* the side of the head. Dr. William Midgett's story is similar. While his presence in the emergency room was confirmed by the Warren Commission testimony of several nurses, his impressions were not recorded until decades later when he was interviewed first by Gerald Posner and then Wallace Milam. He is reported to have told Posner the wound was *"more parietal than occipital"* and to have told Milam it was an approximately 6 cm wound in the parietal area behind the ear. This is NOT a wound on the far back of the head oozing cerebellum.

Nor was the wound described by Dr. Donald Seldin. When contacted by researcher Vincent Palamara in 1998, Seldin is reported to have claimed that the bullet exploded the skull, and that the *"frontal, parietal, and temporal bones were shattered."* No mention of the occipital bone. While Seldin, apparently, was somewhat confused, telling Palamara the bullet struck Kennedy in the forehead (perhaps he meant upon exit), he was most adamant that his recollections not be used to spread doubts, telling Palamara *"I believe that the official story is accurate in all details."*

And then there's Grossman... While there is almost no record of Dr. Grossman's presence in Emergency Room One on 11-22-63, he emerged in 1981 with claims of having been at Dr. Clark's side when Kennedy's wounds were studied. His statements and articles not only reflect that he alone, of all the doctors to work on or inspect Kennedy at Parkland, noted an entrance wound on the back of Kennedy's

head in his hair, but that he also recalled seeing a large exit wound on the right side of Kennedy's head above his ear. Although this supports my conclusions regarding the wound locations, I nevertheless suspect Dr. Grossman is full of hooey. It just smells to high heaven that the only Parkland doctor claiming to see an entrance wound on the back of JFK's head was a doctor no one else remembered even being there, who failed to come forward for 17 years or more. There's also this: while Dr. Grossman reportedly told the ARRB in 1997 that the entrance wound he saw was *"a circular puncture in the occipital region...approximately 2 cm in diameter, near the EOP, centerline, or perhaps just right of center, through which he could see brain tissue which he believed was cerebellum"* (which is in the same location as, but much larger than, the wound described in the autopsy report), a November 22, 2003 article by Frank D. Roylance in the Baltimore Sun based upon an interview with Grossman reported that *"Grossman and Clark saw a small wound about an inch in diameter on the upper part of the back of his head, just to the right of the midline...filled with damaged brain tissue"* (which would appear to be a reference to the supposed cowlick entrance). So, did Grossman move the location of the entrance wound he and he alone "saw" to kiss up to those holding the wound was in the cowlick? I don't know but it's just hard to believe anything he says...

And that's not the end of the Parkland witnesses claiming the wound was NOT on the back of the head. Should one choose to look beyond Grossman, one can find Sharon Calloway. Calloway, an x-ray intern at Parkland on the day of the shooting, performed an oral history interview for the Sixth Floor Museum on 1-27-02, and claimed she saw the back of Kennedy's head in the hallway before he was moved into Trauma Room One. She claimed: *"The top of his head was gone... One of the doctors came down the hall shaking his head and he said it looked like someone had dropped a ripe watermelon on the floor. This is what the top of his head looked like. And we could see that. We could see his head. It wasn't draped yet."*

And should one still refuse to believe that there was no large exit wound low on the back of Kennedy's head and that the rotation of Kennedy on the hospital stretcher led to confusion about his head wound location, one should know that, no matter the explanation, such confusions occur. In the early 1990's, now Associate Professor Daniel Simons of the University of Illinois at Champaign-Urbana created a video of six people passing basketballs back and forth, while moving around in a circle. Simons played this video to unsuspecting subjects, asking them how many passes were made, or whether the women in the video made more passes than the men. No matter. The passing was just a distraction. During the middle of the short video-taped passing demonstration, a man in a gorilla suit walked into frame and stood in the middle of the basketball players. What Simons really wanted to know was if anyone counting the number of passes would notice this man in the gorilla suit. He got his answer, which continues to confound people to this day. He found that, upon first viewing, only about 50% of those looking straight at--no, actually studying--a video of a man in a gorilla suit, had any recollection of seeing him, when their attention was drawn to unrelated details. One can view this video, here.

<http://viscog.beckman.illinois.edu/flashmovie/15.php>

The application of Simons' experiment to the Kennedy case should be obvious. From the failure of so many to note the gorilla in the room one can easily extrapolate that the team trying to save Kennedy's life was so focused on trying to save his life that the exact location of his head wound was only a fuzzy afterthought...prone to manipulation...

No, not deliberate manipulation, but accidental. As the testimony of the Parkland witnesses, which came after Dr. Clark's observation of cerebellum had been made public, reflected a greater degree of cerebellum sightings than the original statements of these witnesses, and as the location of the wound described by the witnesses coming forward in the 80's, which came after the publication of the so-called McClelland drawing showing an occipital wound, were centered on the occipital bone to a greater degree than the wound described previously, it's reasonable to assume that social pressures,

"groupthink," if you will, was in part responsible for so many of these witnesses thinking the wound was further back on the skull than as shown in the autopsy photos.

A study reported in the July 2011 issue of Science Magazine supports this probability. In this study, participants were 1) shown an eyewitness-style documentary in groups of five, 2) brought back individually three days later and asked questions about what they'd observed, 3) brought back four days later and shown the answers of those tested at the same time as them, 4) asked the questions again, 5) brought back again 7 days later and told that the answers of the others they'd been shown the week before had been random answers, and may or may not have been the actual answers of those with whom they'd originally viewed the documentary, and 6) asked the same questions again, after being told to rely on their original memories. The participants were then debriefed, with the results of those suspicious they were being manipulated thrown out.

The results were impressive. While some of the answers of others shown the participants a week after viewing the documentary were 100% wrong, and not even the real answers given by the others, 68.3% of the participants answered these questions in accordance with how they'd been told the others had responded, even though they'd answered these questions correctly only four days before. That this wasn't simply a failure of memory is proven by a control test, in which only 15.5% of those getting an answer right three days after viewing the documentary got it wrong 14 days after viewing the documentary. This suggests that over 50% of the participants changed their answers to fit in with the crowd.

That this wasn't just a change of answer, but an actual change of memory, for many of those tested, moreover, was demonstrated by the results of the final test. 40.8% of the participants who got a question correct, and then changed it to fit in with the crowd, stood by their incorrect answer after being told the answers of others they'd been shown had been randomly generated, and that they were now to rely exclusively upon their original memories. Disturbingly, this suggests that the memories of a significant percentage of the public can be changed, permanently, by being told what their peers remember, even if what they're told is something they at one time knew was untrue.

Memories are fragile. The recollections of the Parkland witnesses, co-workers who undoubtedly discussed what they saw with other co-workers, most if not all of whom would have been familiar with Dr. Clark's description of the wound, are just not as reliable as many would like us to believe.

And should this explanation not suffice, and should one still refuse to believe that the excitement of a trauma room can lead to mistakes in bullet wound identification (and/or that trauma room physicians are not properly trained to judge the direction of bullet wounds) one should know that Wake Forest University indirectly studied this from 1987-1992, by comparing the reports of trauma specialists with the corresponding reports of forensic pathologists. This study, as described in an April 28, 1993 article in the Journal of the American Medical Association, found that, with multiple gunshot wound victims, trauma specialists mistakenly identified the number of shots or the direction of fire 74% of the time, and that, even with single shot victims with through and through wounds, they were mistaken 37% of the time. Doctors make mistakes. Lots of 'em...

As do historians...

Kurtz score on Jenkins: The wound described by Jenkins was along the right side of the head, not back of the head. While Jenkins mentioned cerebellum, he did not describe the wound as a wound of exit. Kurtz's summary of Jenkins' statements is therefore **inaccurate on 2 of 3 points. Misleading.**

Final Kurtz score: Kurtz has misrepresented every initial statement to some degree. Four of the six doctors to comment on the head wound on 11/22/63 mentioned locations more to the side of the head and/or top of the head than the wound described by Kurtz. Others made no mention whatsoever of the

occipital bone or the cerebellum. None described the wound as an exit. Even worse, Kurtz has deliberately ignored Clark's and Perry's statements suggesting the wound could be a wound of both entrance and exit, and the likelihood that ALL the other doctors would defer to this analysis. By including Ronald Jones and Paul Peters in his list of doctors making these statements, moreover, Kurtz implied they'd made statements in the days after the assassination that could be considered "fresh" when, in fact, Dr. Jones' 11-23 handwritten report (Jones Exhibit No. 1) said merely that Kennedy had suffered a "severe skull and brain injury" and the earliest statements one can attribute to Peters were made several months later, after no doubt dozens of discussions on the assassination with his fellow Parkland physicians and nurses. Kurtz's summary, then, which was **accurate on only 6 of 18 points** in the initial statements of the Parkland doctors, can only be considered **misleading**.

Still, I wouldn't want to be accused of being unduly arbitrary, so let's see if adding Jones' and Peters' subsequent testimony into the mix improves things for Kurtz.

When Dr. Ronald Jones testified on 3-24-64 he said Kennedy had "a large wound in the right posterior side of the head" and then further described *"There was a large defect in the back side of the head as the President lay on the cart with what appeared to be some brain hanging out of this wound with multiple pieces of skull noted next with the brain and with a tremendous amount of clot and blood."* He later discussed *"what appeared to be an exit wound in the posterior portion of the skull."* He had thereby described the wound as a probable exit. But he'd failed to mention "occipital" and "cerebellum." Kurtz was therefore **inaccurate on 2 of 3 points. Misleading**. As discussed, Jones would later defer to the accuracy of the autopsy photos, and tell the ARRB that *"it was difficult to see down through the hair."* He then clarified his position to researcher Vincent Palamara, first admitting that he really didn't have *"a clear view of the back side of the head wound. President Kennedy had very thick dark hair that covered the injured area"* and then offering *"In my opinion it was in the occipital area in the back of the head."*

Which brings us once again to Dr. Peters...When Peters testified on 3-24-64 he described *"a large defect in the occiput"* and then explained *"It seemed to me that in the right occipitalparietal area that there was a large defect. There appeared to be bone loss and brain loss in the area."* He then described it as *"a large occipital wound,"* and admitted to wondering, as Jones, if the head wound wasn't an exit for the bullet creating the presumed entrance wound in the throat. Although Peters would later tell David Lifton that he looked down into the skull and saw cerebellum, he failed to claim that cerebellum was oozing from the wound, and, in fact, told the Bangor Daily News in 1980 that he'd come to believe the wound was a tangential wound of entrance and the Boston Globe in 1981 that the cerebellum had been intact. After being shown the autopsy photos for the Nova program in 1988, moreover, Peters asserted that he'd been wrong about both the location of the wound and his seeing cerebellum, and then offered that *"that shows how even a trained observer can make an error in a moment of urgency."* He then confirmed this position at a Dallas Forum put together by Dr. Lattimer in 1992, at which he, along with Dr.'s Carrico and Jenkins, were reported to have insisted that they'd confused cerebrum for cerebellum *"in part because the brain was so mangled by the bullet."* And this wasn't just Carrico speaking for Peters. For his 1993 book *Killing the Truth*, writer Harrison Livingstone obtained a copy of the tape of this forum, and revealed that Peters, when asked if he had changed any of his impressions over the years, had indeed admitted that after viewing the autopsy photos in 1988 he'd changed his mind about seeing damage to the cerebellum. In 1998, when testifying for the ARRB, however, Peters admitted that he, as McClelland, still thought the large wound observed at Parkland to have been at the back of Kennedy's head, and that it was covered in the autopsy photos by a flap of some sort. He covered himself, just in case, however, by explaining what he'd come to accept were mistakes by asserting *"We were doing a resuscitation, not a forensic autopsy."* Peters had thereby retreated from his statements to Lifton. Still, in his original statements, Peters had indeed described a presumed wound of

exit at least in part on the occipital bone, which means Kurtz was **accurate on 2 of 3 points**.
Somewhat misleading.

So, even with Jones and Peters added back in, Kurtz was **accurate on but 9 of 24 points**, and was undoubtedly **misleading**. While he, as Groden, as Lifton, as...you can pretty much fill in the blank...indicated that the original statements and testimony of the Parkland witnesses universally described an occipital wound from which cerebellum was flowing, this is a conspiracy myth, as pervasive and deceptive, in this writer's opinion, as the single-bullet theory, which some claim as a fact.

I'm serious about this. While many of those pushing the single-bullet theory claim their theory is in line with Governor Connally's statements and testimony, when it is not, conspiracy theorists pushing the "back-of-the-head blow-out" theory are no better, as they claim their theory is in "support" of the Parkland witnesses, when it is not. In fact, when one looks back through ALL the statements of the eight doctors most involved with Kennedy's treatment at Parkland, one finds that six of the eight (Perry, Carrico, Baxter, Jenkins, Jones, and Peters) let it be known that they deferred to the accuracy of the autopsy report and autopsy photos, and one (Clark) rarely spoke on the subject beyond his Warren Commission testimony, where he deferred to the conclusions of the autopsists. This leaves but one conspiracy theorist in the bunch (McClelland), and even he admitted he'd seen nothing at Parkland to convince him shots had been fired from in front of Kennedy, and that his suspicions stemmed largely from his interpretation of the Zapruder film.

Sadly, however, Kurtz's misrepresentation is typical of what one finds in the conspiracy literature. While I don't expect to change the minds of those utterly and permanently convinced there was an exit wound on the back of Kennedy's head, I do hope to curtail the spread of such smoke. ***Please help me in this cause.***

Chapter 19: Wrestling Over History

A hard look at the blind referee and the tag team in white

Guardians of the Truth

At left: a photo of the limousine en route to Parkland Hospital taken by David Miller, as presented in the Dallas Morning News on 11-24-63. Note that the caption says the white arrow points to Kennedy's *left* foot. The Associate Press later decided it was Secret Service Agent Clint Hill's *right* foot. Did they get it right the second time?

HORROR AND FEAR IN THE PRESIDENTIAL DEATH CAR

As President Kennedy's left foot, white arrow, hangs limply over the side of the speeding death car, Mrs. Kennedy and Mrs. Connally crouch against the seats in horror and fear. Gov. Connally,

black arrow, lies in pain as the auto hurtles at 70 miles per hour toward the Oak Lawn Avenue exit on Stemmons Freeway, en route to Parkland Hospital.

At left: a James Altgens photo of Clint Hill on Houston Street, revealing his shiny black shoes.

At right: the Justin Newman photo of Clint Hill during the limousine's race to Parkland Hospital. Note that Hill's leg is stretched across the back of the car and his foot is behind the tire. Note also his black socks.

Guardians of the Truth

After spending the last several hundred pages arguing that the autopsy photos and x-rays have not been altered, I will now discuss a photo I believe has been altered. The story of this photo and its alteration is, in my opinion, symbolic of the mainstream media's approach to the assassination.

The photo in question is the Miller photo, a photo taken by a high-school student of the President's limousine as it sped towards Parkland Hospital. This photo was published world-wide beginning on 11-24-63 and still shows up regularly in books on the assassination. The most memorable (and marketable) thing about this photo is that it shows an object sticking out of the back seat. This object was initially identified as President Kennedy's left foot. This confused at least one eyewitness. S.M. Holland ended up telling Mark Lane he SAW Kennedy's foot fly up onto the side of the car.

Years later, however, the Associated Press, who'd quickly purchased the photo from Miller, decided the object was not Kennedy's foot at all, but secret service agent Clint Hill's right foot. (Of course, this didn't stop a whole slew of books, including those by veteran newsmen Robert MacNeil and Wilborn Hampton, from continuing to claim the foot was Kennedy's.) As Clint Hill was upright and faced forward in the back seat, however, this changing-of-the-foot never made much sense to me.

In June, 2006, I went public on the JFK Lancer Forum with my suspicions that the foot in the photo had in fact been drawn in. One defender of the AP's story cited another photo of Hill on the back of the limousine, the Newman photo, as proof that the object in the photo was in fact Hill's foot. This photo, however, showed Hill's leg draped across the trunk of the limousine, and his foot hanging off the side of the car behind the tire. As the Miller photo showed Hill's legs angled down into the rear seat, the Newman photo only confirmed for me that something was odd with the Miller photo. When asked why someone would alter the photo I said that perhaps the photographer and/or the original paper to publish the photo, The Dallas Morning News, was aware that there were other photos of the limousine, and cynically added the foot so that they could sell the photo as including Kennedy. This brought a rapid response from Gary Mack, the curator of The Sixth Floor Museum, and a recognized expert on the photographic evidence:

From a 6-19 e-mail: "Pat, David Miller's photo wasn't faked! Do you know anything about him or his picture, how it came to the attention of the news media, or when? Have you ever seen his original photograph or a first generation print? Or the AP copy negative, or The Dallas Morning News copy negative. Wait, I'll answer for you. You don't know anything about that information. Have you listened to Clint Hill talk about how he hung his foot over the side to steady himself while hovering over JFK as they roared down the highway at 80mph?????"

Why DO you people make up such ridiculous stories?!?!?!?!?!?"

Mack's fervent response unnerved me a bit. I had been an ally of his as long as I was arguing for the authenticity of the Zapruder film, but once I switched teams and implied that any piece of the photographic history was faked, I had become a "you people."

Another Forum member posted Clint Hill's Warren Commission testimony indicating that the foot was indeed his own.

Mr. SPECTER. And where were the President's legs at that time?

Mr. HILL. Inside the car.

Mr. HILL. It is a little bit hard for me to judge, since I was lying across the rear portion of the automobile. I had no trouble staying in that particular position--until we approached the hospital, I recall, I believe it was a left-hand turn and I started slipping off to the right-hand portion of the car. So I would say that we went 60, maybe 65 at the most.

Mr. SPECTER. Were you able to secure a handhold or a leghold or any sort of a hold on the automobile as you moved forward?

Mr. HILL. Yes, sir. I had my legs--I had my body above the rear seat, and my legs hooked down into the rear seat, one foot outside the car.

After reading Hill's testimony, I thought, "okay, well maybe I'm wrong, maybe it is Clint Hill's foot in the photo..."

From Hand to Foot?

At left: Yarborough Exhibit A from Volume 22 of the Warren Report. The Miller photo as shown in the 12-14-63 Saturday Evening Post.

Below: three versions of the "shoe." From L to R, the shoe as seen in the 12-14 Post, the 11-24 Dallas Morning News, and the 1963 book The Torch is Passed.

Below: the Skaggs photo, taken in Dealey Plaza. Note the elevation of the seat.

From Hand to Foot?

Only a few days after my "drawn-in foot theory" was shot down, however, I discovered the Yarborough Exhibit, a 12-14-63 article in the Saturday Evening Post entered into evidence by the Warren Commission. In this article a version of the Miller photo was published. Shockingly, however, the "foot" in the photo, which was once again described as a foot, looked nothing like the "foot" shown in the newspaper articles. Upon close inspection, in fact, it seems clear that the Associated Press gave The Saturday Evening Post access to the original photo or negative. If so, this photo proves that the "foot" in the newspaper versions of the photo was drawn-in.

After this discovery, I quickly posted links to the Yarborough Exhibit on the Education Forum. I also sent another e-mail to Gary Mack, who I thought should know that the photo in the Dallas Morning News, as well as the one re-printed in such esteemed books as Richard Trask's Pictures of the Pain, had been altered. His response surprised me. He continued to insist that the version of the Miller photo in the Yarborough Exhibit matched the early newspaper versions, something I believed I'd just demonstrated to be untrue...

From a 6-27-06 e-mail from Gary Mack:

(In answer to my assertion that the foot in the Miller photo failed to match the “foot” in the Yarborough Exhibit.) *“Yes, it really does, especially when you look at a first generation, from the negative, print as Richard Trask and others have done over the years. Miller developed the film at school himself that afternoon and let The Dallas Morning News copy his original negative that night. The News ran it two days later after sending it out to the AP and its subscribers on 11/23. Are you suggesting that David altered his own picture? That's the only way your theory can work, Pat. Miller's picture ran on page 11 in the Dallas Morning News on 11/24. News chief photographer Tom Dillard PRINTED the News' copy directly from Miller's negative. Dillard sent a copy negative to the AP, which sent it all over the world on 11/23. The AP's photo distributor, Wide World, licensed the photo to the Saturday Evening Post, which ran it on page 24 of its 12/14/63 issue (that's the source of the Yarborough exhibit). ALL of them look the same. The best book/magazine/newspaper reproduction version is the Post issue. NONE are as good as first generation prints from Miller's negative. Trask has one. Other researchers have them. I have seen the Dallas Morning News' copy. They ALL show the same thing - a shoe and pant leg that cannot possibly be Kennedy's. A shoe that can only belong to Clint Hill. Miller misidentified the foot and the news media, beginning with the Dallas Morning News, repeated his account until it was later corrected. I have seen the AP's correction notice, which came later that year. They notified their subscribers, but not all members made the notations on their file copies of the photo, which is why, years later, some were still saying it was Kennedy's foot. Why don't you write to AP/Wide World Photos and buy a print. Or buy the 12/14/63 Saturday Evening Post on eBay?....Or call Trask and ask him. Or call Miller's widow. Do something other than make up a bogus explanation.”*

I was dumbfounded by this response, and asked Gary to look at the two versions of the Miller photo I'd posted online. He once again responded by insisting that the original photo was the photo published in the Dallas Morning News and that, if anything, the Saturday Evening Post version of the photo was the one that was retouched.

From a 7-6-06 e-mail from Gary Mack. *“Let me summarize. David Miller developed and printed his photos the afternoon of 11/22. He and his father met with Tom Dillard of the Dallas Morning News that evening and they allowed the News to make a copy of David's original negative. The News made a copy for the Associated Press, which sent the picture to its worldwide subscribers the next day. David Miller is the apparent source of the belief that the object was JFK's foot. The News passed that story along to the Associated Press, which repeated the information. Many AP subscribers, following normal procedures, kept the photo in their files and published it on occasion. The AP routinely sent out the picture to subscribers and others wishing to license the image for various publications. All AP source images are the same and all contained the misinformation about JFK's foot. Some publications, both newspaper and magazine, may have retouched the foot to make it reproduce clearer for the reader. Not until the late 80's did someone check with Clint Hill about whether or not that was JFK's foot. Hill officially set the record straight saying that the foot was his, not Kennedy's, and the information was passed along to the AP. The AP corrected their own caption as early as 1963 or 1964, but all those earlier AP images and incorrect information remain on file in newsrooms and other places around the world; therefore, the erroneous assumption that the foot belonged to Kennedy still gets repeated. The version in the Saturday Evening Post came from the same source material as the picture in Trask's Pictures of the Pain and the Dallas Morning News' Sunday edition. Whether the Post retouched their picture or not, I do not know. Such photo retouching/enhancement was routine in the newspaper business then because the reproduction clarity of photographed images was often rather poor. The Museum does not have a print of the Miller picture, though I have seen Trask's print, one in the Dallas Morning News files, and one or two others, including an original 11-24-63 Dallas Morning News newspaper. All show the same thing: a foot hanging over the side of the Kennedy limousine.”*

When Zapruder-film alteration theorist Jack White entered the online fray and stated that in his opinion the “foot” in the photo was really a hand resting on the top of the back seat, and I said he might be onto something, all hell broke loose. Post after post came claiming I was intellectually dishonest and Jack White was senile. “How could it be a hand?” “The shadows over the chrome on the side of the car prove it was a foot.” From this, I learned firsthand what it was like to be an alterationist and have the “guardians of the truth” attack your every word. While the defenders of the Clint Hill foot story (aside from Gary Mack) agreed that the “foot” had been altered to look more like a foot, they just couldn’t accept that the original object could be anything but a foot. When I pointed out that the “foot” appeared to have white socks and Clint Hill was wearing black socks, they said that was just the reflection of the sun. When I pointed out that the Miller photo was taken while Clint Hill was still on the Stemmons Freeway and that he’d testified to hooking his foot over the door after they pulled onto the off ramp, it brought nothing but guffaws. When I pointed out that it really didn’t matter whether it was Hill’s foot or not, since the Dallas Morning News initially altered the photo thinking it was Kennedy’s foot, and the Associated Press continued publishing the altered version of the photo, most prominently in their photo book *The Torch is Passed*, knowing full well the photo failed to match the original photo, it brought nothing but a “so what?” Few seemed to care that the Dallas Morning News and the AP made the shape in the photo look like a foot without ever attempting to find out whose foot it was, or even if it really was a foot. No one seemed disturbed that the AP gave an altered version of the photo, with the incorrect claim the foot was Kennedy’s, to the U.S. Secret Service, and that the Secret Service accepted their claim and presented this photo to the Warren Commission with the incorrect caption on January 8, 1964 (CD87, p504). No one even cared that this altered foot photo, with its incorrect caption claiming the foot belonged to Kennedy, made its way into the Doubleday version of the Warren Report, the book supposedly designed to tell the public the ultimate truth on the killing of President Kennedy. The photo of the dead man’s foot sold newspapers, magazines, and books. And evidently that was what mattered to the press in 1963.

Accessories Not After the Facts

On 12-2-10, the Discovery Channel premiered *The Kennedy Detail*, a 2 hour program telling the story of the assassination through the eyes of several members of Kennedy's Secret Service detail, one of whom, Paul Landis, can be seen to the right of Mrs. Kennedy in the photo at left, taken just after President Johnson was sworn into office. While the program could have broken new ground, and asked Landis such questions as 1) why he went out drinking until 5 o'clock in the morning on the day of the shooting, and 2) whether he noticed Rep. Albert Thomas winking to Johnson in the photo at left, and whether he found it as "sinister" as the photographer taking the picture, Cecil Stoughton, it did little digging, and focused mainly on the grief of the agents.

This was all too typical of the media's approach to the assassination: focus on the tragedy, and avoid the real questions. As first observed by Randy Owen, however, this program's producers crossed a line. When discussing the aftermath of the assassination, they presented three of Stoughton's photos of the swearing in, including the photo above. While doing so, however, they presented the key figures in the photos separately, and moved them slowly about. This created a jarring 3D effect, that, unfortunately, was not the only effect. In something straight out of Orwell, and as shown at right, Rep. Thomas' "sinister" wink was thereby concealed beneath Mrs. Johnson's slowly moving head. Hmmm...

Accessories Not After the Facts

And still matters. In 2003, I witnessed the media's treatment of the 40th anniversary of the assassination. Of the various television specials, the most anticipated and watched was the one on ABC, *Beyond Conspiracy*, hosted by anchor man Peter Jennings. The show opened on a discouraging note. Jennings boldly stated that he would present new evidence which established beyond a doubt that Oswald was a lone assassin. He then predicted that only those "beyond the pale" would doubt his evidence. Well, his "new" evidence turned out to be the same old half-truths from Gerald Posner and John Lattimer, spiced up by Dale Myers' blatantly deceptive animation. As bad as this was, Jennings saved the most insulting part of his program for the end. In summing up, Jennings quoted William Manchester on the ongoing attraction of conspiracy theories: "... if you put the murdered President of the United States on one side of a scale and that wretched waif Oswald on the other side, it doesn't balance. You want to add something weightier to Oswald. It would invest the President's death with meaning, endowing him with martyrdom. He would have died for something. . . . A conspiracy would, of course, do the job nicely." This statement of course grossly overstates both modern America's emotional attachment to JFK and the "wretched" status of Oswald, who was in fact quite an interesting young man. (After all, in 1963, how many 24 year-old ex-Marines had lived in Russia? Had lectured on the differences between the U.S. and Russia? Had discussed American foreign policy on radio and TV?) No, unfortunately for the late Mr. Jennings the reality seems more and more the reverse—that those who've continually *denied* there was a conspiracy are the ones doing the rationalizing and the ones unable to accept an inconvenient truth.

Consider the words of legendary lawyer Louis Nizer, in his introduction to the Warren Report: "*No one is as blind as those who will not see, and sight can be blocked by neurotic adherence to a conviction in which one has an investment of pride or a more sordid interest. We may expect therefore, that those*

who cannot be dented by information will continue to carp and propagandize...In this sense the report will not end all speculation. But in the historic sense, now that all the facts available have been quarried and justly evaluated, the report will dispose convincingly of the major questions. This is the incalculable service rendered by the Commission. This is its achievement in effectuating domestic tranquility and overcoming foreign skepticism. This is its contribution to history." Unfortunately for Nizer, the subsequent decay of the Report's reputation has led some to conclude that one of the closed minds he described in the introduction was his own. Certainly, his assertion that the flawed report had justly evaluated all the available facts, disposed convincingly of the major questions, effectuated domestic tranquility and overcame foreign skepticism reflected his own "investment of pride" in his conviction, and demonstrated his own willingness to "propagandize." But why would a man such as Nizer risk his reputation defending such a whitewash?

For that answer, let's consult with Chief Justice Earl Warren. From his memoirs, written shortly before his death: *"Practically all the Cabinet members of the Kennedy Administration, along with Director J. Edgar Hoover of the F.B.I. and Chief James Rowley of the Secret Service, whose duty it was to protect the life of the President, testified that to their knowledge there was no sign of any conspiracy. To say now that these people, as well as the Commission, suppressed, neglected to unearth, or overlooked evidence of a conspiracy would be an indictment of the entire government of the United States. It would mean the whole structure was absolutely corrupt from top to bottom, with not one person of high or low rank willing to come forward to expose the villainy..."* That so much depended on the Warren Commission's being right and on Oswald being the lone assassin might seem inconceivable today, when so many argue the merits of the case against Oswald as a purely intellectual exercise, but to men like Nizer and Warren this was a deeply serious matter. They *couldn't* be wrong. They couldn't even think about it without questioning the basis of their lives. Well, if life has taught me anything, it's when you're desperate for something to be true, it usually means you're afraid it isn't, and are too afraid to give it an honest look. And being afraid to look is no way to run an investigation.

As to why the controversy continues, long after men such as Nizer and Warren have passed, let's consider the words of newsman Jim Lehrer, from his own memoirs. Lehrer's words articulate the news media's ongoing resentment towards the "research" community, and reveal a possible motive for the likes of Peter Jennings when they attempt to discredit the believers in a conspiracy, and, in particular, Oliver Stone. Lehrer, who acknowledges a conspiracy is possible, nevertheless says of Stone's JFK, *"The movie, directly or indirectly, alleges that hundreds, thousands, of working CIA, FBI, and other agents; police officers, deputy sheriffs, Warren Commission staffers and congressional investigators; and reporters from news organizations of all sizes, persuasions, and resources were not interested in finding out who killed Kennedy, or worse, were either involved in the assassination, and/or the cover-up or manipulated by evil higher-ups who were. It is an absurdity beyond all honest imagination to claim people of such independent minds and spirits could be so involved or so used in killing a President of the United States...Only in a never-never land of the ignorant and the careless would such an idiotic conspiracy be taken seriously. It is a blood libel to repeat it in public, particularly in a large-screen \$40 million movie. And it says more about the people who make, finance, and appear in movies these days than it does about who killed John F. Kennedy."*

What Lehrer leaves unsaid is that researcher Harold Weisberg, working with attorney Jim Lesar, dug up more evidence on the assassination via the Freedom of Information Act than all the newspapers and news agencies in the country combined, and that this says something about the people who run the corporations who make, finance, and distribute newspapers in America these days. Mr. Lehrer also failed to note that, to this day, no network news division has ever done a special on the assassination that remotely details the evidence for the CIA's involvement in the conspiracy, and that maybe this says something about the people who run the media conglomerates who own the airwaves as well.

But Lehrer was far from alone. Most every icon of the American news industry has marched in lockstep on this point, arguing out one side of their mouths that they did everything they could to uncover the truth, whilst simultaneously spewing nonsense from the other side that indicates they were really too lazy or cowardly to even look for it.

A November 21, 1966 article by Wayne Thomis of the Chicago Tribune Press Service helps demonstrate this point. This article, written as a defense of the Johnson Administration and Warren Commission at a time when the public was just learning about a lot of the problems with the evidence against Oswald, claimed, in part:

- *"the commission headed by Chief Justice Earl Warren had at its disposal all the facilities of the Federal Bureau of Investigation, the Secret Service, and the Central Intelligence Agency. Had there been any basis for finding that a foreign power or agency was involved in the assassination, one or more of these federal investigative groups--all of whom were decidedly on a public hot seat because of the presidential murder--would have said as much." (This, of course, was utter hogwash. It turned out that both the CIA and FBI had knowledge of the CIA's assassination attempts on Castro--and of Oswald's supposed devotion to Castro--and yet neither thought it important to apprise the Commission of this fact.)*
- *"As to the shots, a point always debatable: Dallas police who were beside the presidential car and Secret Service men who were in and around it, have never had any doubts. All are convinced that three shots were fired and that all three were from an upper floor of the Texas School Book Depository building where the death rifle and three spent cartridges were recovered." (This is more hogwash. Two of the four Dallas policemen beside the presidential car--Chaney and Jackson--had not been interviewed by any official body or newspaper by 1966. A third--Hargis--only heard two shots. So only 1 of the 4--Martin--and not "all" of the Dallas police riding beside the limousine, as Thomis claims, heard three shots and thought they all came from behind. A number of Secret Service agents also had their doubts. Two--Hill and Landis--made it clear they only heard two shots. Landis also said he at first suspected that the last shot came from in front of the limousine. Even more problematic, however, was that all 8 of the agents claiming to have heard three shots said they heard the last two shots come in quick succession, which was inconsistent with Oswald having fired all the shots with his bolt-action rifle.)*
- *"There is a photograph in the Kennedy file taken at the time of the shooting. This shows a rifle muzzle protruding from the sixth floor window of the building." (It appears Thomis made this up from whole cloth. Perhaps he was thinking of photographer Robert Jackson's testimony that he saw the rifle but was out of film.)*
- *"On that same day (note: he means the day of the shooting) doctors also said that one of the bullets that pierced President Kennedy had continued on to wound Gov. Connolly, and they added that this bullet was found on the car's jump seat where the governor had been riding." (This is another fabrication. The doctors speaking in Dallas on the day of the shooting not only never mentioned the possibility that the bullet piercing Kennedy went on to hit Connolly, they discounted the possibility in their testimony before the Warren Commission. Their resistance to this theory was so great, in fact, that Connolly's doctor Robert Shaw never came to accept it. Even worse for Thomis, NO ONE, on the day of the shooting or even in the years immediately afterwards, had suggested that the magic bullet was found on the jump seat of the limousine. This then would appear to be a half-assed recollection conjured up for a half-assed article by what is apparently a half-assed journalist.)*
- *"Many desk and typewriter types doubt that a bolt-arm could be sighted and fired three times in five to six seconds. Rifle experts around the world know that this is easily possible. Also they*

recognize that the President's attacker fired from point blank range (as far as the high-velocity military rifle was concerned) at a no-deflection target, so the shooting was good but not sensational." (This is a gross exaggeration. Shooting at a moving target from almost a hundred yards away can never be considered shooting at "point blank range.")

- *"Oswald walked down the street and boarded a bus that took him, with many leisurely stops, out to Oak Cliff, a Dallas suburb. Then he dropped off and took a taxi (The reaction was beginning to set in) to his solitary in-town room in that area. Once there he hastily changed his shirt and jacket and stuffed a revolver and handful of cartridges into his pocket." (This would be funny if it weren't so annoying. The Warren Commission determined that Oswald got off the bus long before it reached Oak Cliff. It determined, furthermore, that Oswald DID NOT change his shirt at his "in-town room." This was important because they used the fibers from the shirt Thomis claims Oswald changed into only after the shooting to link Oswald to the gun found on the sixth floor. By suggesting that these fibers were somehow planted after the fact, Thomis thereby fuels the conspiracy theories he is set upon refuting. OOPS.)*

An August 25, 1993 article by columnist Jimmy Breslin suggests that Thomis was far from alone in his desire to report the story as he wanted it to be, rather than as it was.

AT LAST TRUTH ABOUT THE SHOTS

"Case Closed" is a book that tells the truth. It was written by Gerald Posner and published by Random House. Posner shows that Lee Harvey Oswald killed President John F. Kennedy by himself. Case closed.

Then there is Oliver Stone, whose movie "JFK" was what my friend Fred Dannen of the New Yorker magazine calls, "An intellectual snuff film. Literal truth is murdered on screen."

I was in Dallas on the day Kennedy was shot and spoke to the doctor who was doing the chest-thumping at the end. He knew two bullets had hit Kennedy in the back. Which meant Oswald. And I had been with the Dallas police, who had just lost officer J.D. Tippit. He had been killed by Oswald, who, completely alone, was trying to get away and had no idea where to go.

Now Oliver Stone sends the video of his movie to schools around the country so they can show it in years to come. But finally, here is Gerald Posner, who worked like a ditchdigger and documented every paragraph of "Case Closed" and can tell us: "But for those seeking the truth, the facts are incontrovertible. They can be tested against credible testimony, documents and the latest scientific advances. Chasing shadows across the grassy knoll will never be the substitute for real history. Lee Harvey Oswald, driven by his own twisted and impenetrable furies, was the only assassin at Dealey Plaza on Nov. 22, 1963. To say otherwise, in the light of the overwhelming evidence, is to absolve a man with blood on his hands and to mock the president he killed."

"Case Closed" shows that Lee Harvey Oswald's palm prints were all over boxes he used to put up a sniper's nest, and all over the gun and the paper it was wrapped in when he brought it to work.

In the movie, they had the FBI taking Oswald's hand, after he was shot, and slapping it on the gun to provide a handprint. And in the movie, Stone never had Oswald firing a shot.

After the shooting, Oswald ran out of the Texas School Book Depository building and had to get on a bus, get off the bus, then murder Tippit in broad daylight in the street and run into a movie without paying and try to hide.

In the movie, the shooting of the officer, Tippit, simply did not happen. Posner shows that what this Stone did was to take two big best-selling conspiracy books, one by Jim Garrison, the New Orleans district attorney who was crazed, and the other by Jim Marrs, who wrote that Kennedy was shot by a world-class assassin who was hired by the world crime syndicate, the CIA, the anti-Castro people and the right wing and the U.S. military. Both of these books made a lot of money and covered the shelves with slime.

I sat in an office at Parkland Hospital with Dr. Malcolm Perry a few hours after President Kennedy was killed. Perry had been one of the first two medical people in the trauma room when Kennedy was brought in. Perry was elated when Posner came around and asked for the truth.

That day in 1963, Perry had been eating salmon croquettes in the cafeteria when the call came that they were bringing the president in. He cut Kennedy's throat to insert a tube for breathing. The cut was directly over an exit wound from a shot that had hit Kennedy in the back of the neck. Dr. Pepper Jenkins, who had done the most gunshot wounds, felt the entrance wound in the back of the neck. Perry began massaging Kennedy's chest, and the guy working with him, Kemp Clark, said, "It's too late, Mac."

In all conspiracy theories, they demand to know why Kennedy's body hadn't been turned over so they could look for a wound in the back.

Kennedy was dead and his wife was standing over him. And the doctors said they didn't turn him over because they "didn't have the heart."

There was a morning in my memory when the late John Connally, who had been in front of Kennedy in the car in Dallas, walked into the unopened bar of the Regency Hotel on Park Avenue and with busboys and cleaning men looking at him, he pulled off his jacket and shirt and showed a long wound behind his right shoulder. Connally said it showed that the bullet had been tumbling over as it hit him because it already had gone through Kennedy's shoulder and neck.

Connally then showed the big exit wound in his chest, then held up his right wrist. There was another dark brown bullet hole. The bullet, tumbling out of his chest, had taken clothing with it into the wrist wound.

He tapped his left thigh. "It wound up here," he told the busboys, "One bullet did that. Through the president first and then right through me."

Now we have Gerald Posner, who cares about telling the truth, which is the job of a true writer.

Breslin is a syndicated columnist based in New York City.

Breslin's article is wrong on almost every key point, beginning with its over-all thesis--that Posner was a reliable truth-teller, and a "true writer." Posner's research was, in fact, so shaky that his fellow single-assassin theorist Vincent Bugliosi felt it necessary to dis-own Posner's dishonest presentation of the evidence. Breslin's attacks on Garrison are equally biased and over-stated.

Where Breslin really falters, no, scratch that, falls, however, is when he injects his personal experiences to support his position. Breslin at first claims that Dr. Perry "knew two bullets had hit Kennedy in the back" but then later acknowledges that Kennedy's body wasn't even turned over in Perry's presence. He thereby contradicts himself, and reveals himself to be far less than a "truth-teller." (Was Breslin thus, not a "true writer"?). Even worse, Breslin fails to tell his readers that when he interviewed Dr. Perry in 1963 Dr. Perry was unaware of any wound on Kennedy's back, and believed Kennedy had been shot from the front. Breslin also fails to tell his readers that his article on Perry, which was widely circulated in the Saturday Evening Post, convinced many that the Government was lying when it later told them that the shots came from behind, and that his own reporting had thereby fed the earliest conspiracy theories, and the subsequent theories of Garrison, Marrs, and Stone.

But Breslin's presentation of Connally as a supporter of the official story is even more egregious. Here, Breslin insists he saw Connally showing his scars off, and claiming that the bullet striking him had come through the President. Well, if Breslin had actually seen this, he should have reported it, because it would have made HEADLINES AROUND THE WORLD. Connally insisted until his dying breath that he was not struck by the same bullet that struck Kennedy and that he NEVER subscribed to the single-bullet theory, not even for a second.

Now, do I believe Breslin deliberately lied about Perry and Connally? While it seems an incredible coincidence that Breslin presented two public figures to support his position that conspiracy theories

are hogwash, and chose two public figures whose statements have long fed conspiracy theories, and LIED about both of them, I actually doubt his lies were deliberate. Instead, I suspect he just remembered things in a manner convenient to his pre-dispositions. He'd just read Posner's book and was anxious to pile on Stone.

But whether or not Breslin lied by design is not the point. The point is that a newsman remotely concerned about the truth, and who'd done one lick of homework, would have known that Perry initially believed the shots had come from the front, and would have known that Connally never stopped disputing the single-bullet theory. Years later, in the November 16 2003 Newsday, Breslin presented another article on Perry. This time he noted that Perry had originally described the throat wound as an entrance wound, and that this had fed conspiracy theories. Perhaps, for this article, Breslin had done his homework.

Breslin's lies at worst, or sloppy misrepresentations at best, are nevertheless informative. It's undoubtedly significant that none of the writers upset over the deceptions in Oliver Stone's admittedly fictional film expressed any concern over Breslin's deceptions about Connally in a supposedly non-fiction article, or similar deceptions in similar articles attacking Stone's film. Evidently, they saw lying as something that "conspiracy theorists" did to stir up controversy, and failed to take note of the lies designed to shut down controversy... Or maybe they took note of these lies, but decided to overlook them due to "professional courtesy."

This latter possibility is undermined by the sad fact that this "professional courtesy" is extended way beyond the realm of their fellow scribes, and is extended to most anyone choosing to say Oswald did it, even those who should be held to a higher standard. When former LBJ aide and MPAA chief Jack Valenti published his memoir *This Time, This Place* in 2007, shortly before he died, not one reviewer of whom I am aware commented on the audacious lies Valenti chose to print as his final words on the assassination. After denouncing Oliver Stone's movie *JFK* as "a piece of beguiling crap, replacing reason with noisy lie from first scene to last," Valenti closed his book with the suggestion he was still haunted by the events of November 22, 1963. He then described a visit to the sixth floor sniper's nest, which purportedly put things in perspective.

He wrote: *"Then I moved toward the sixth-floor window through which four decades ago Lee Harvey Oswald peered, aiming his bolt-action Mannlicher rifle. When I gazed out the window, I saw for the first time how terribly close the depository was to the traffic that swung around the bend onto Dealey Plaza. I could have thrown a baseball and hit a car moving below. I imagined a motorcade, cars moving slowly at 8 miles an hour; and Oswald, a marine skilled with a Mannlicher rifle, at the ready on the windowsill. I thrust my hands together as if I were holding a rifle, aiming at the cars below. Then my hands began to tremble. Angry lizards started crawling over my flesh. A marksman would have no trouble in sighting and shooting, the target was so close."*

This dramatic passage, of course, conceals that 1) the first shot wasn't fired when Kennedy was beneath the sixth-floor window, but when he was more than 50 yards past the window; 2) the motorcade wasn't traveling 8 miles an hour during the shooting sequence, but over 11 miles an hour; 3) Oswald was not a marine at the time of the shooting, but a former marine, 4 years removed from service; 4) Oswald was not only not skilled on the Mannlicher rifle, as far as is known, but there is no record of him having fired it; and 5) Oswald was not a Marine Corps marksman at the time of the shooting, as he'd barely qualified as a marksman in 1959, and had not kept in practice.

But did anyone in the press call Valenti to task for such nonsense? Of course not.

And this wasn't just a courtesy paid an established media icon near the end of his life. In 2010, the History Channel helped create a mini-series on the Kennedy family entitled *The Kennedys*. Word got out that this series was gonna focus on JFK's womanizing and drug use. As a result there was a

backlash against it even before there was a forward lash for it, and the History Channel chose to drop the series. It was finally broadcast on the Reelz Channel, to mostly negative reviews, in 2011. While these negative reviews questioned the over-all historical accuracy of the program, however, few if any noted that the series' depiction of Kennedy's assassination was misleading nonsense seemingly designed to sell Lee Harvey Oswald as Kennedy's assassin. Consider:

- 1) When first shown, Lee Harvey Oswald is sitting in a house cleaning his rifle, presumably preparing for his attempt on Kennedy. In reality, there was no credible evidence Oswald had handled his rifle for months before the shooting, and the rifle found in the school book depository had not recently been cleaned.
- 2) When next shown, Oswald is getting into a car driven by his co-worker, Buell Wesley Frazier. Frazier asks him about the long paper package holding Oswald's rifle, and Oswald tells him it's curtain rods. In reality, or at least the Warren Commission's reality, Frazier did not pick up Oswald, as shown in the series, but met Oswald outside his own house after Oswald had thrown his package into the back of Frazier's car. The significance of this change is that it removes a second witness to Oswald's package--Frazier's sister, who saw Oswald walk across the street and put the package in her brother's car--from the story. Not surprisingly, Frazier's sister, Linnie Mae Randle, agreed with her brother that the package she saw in Oswald's possession was far smaller than the large bag necessary to hold Oswald's rifle, even when the rifle was dismantled.
- 3) It next shows Oswald take his package up to the sixth floor sniper's nest and put it on a box by the window. No one saw him with the package in the building. There is no evidence this happened.
- 4) Soon after, it shows Oswald's co-workers tell him they're heading out to lunch, and that he should meet them down on the grassy knoll. He says he'll be down in a minute. This is totally inaccurate in that none of Oswald's co-workers had their lunch on the knoll. It clearly replaces a real incident, moreover, where a number of Oswald's co-workers heading down from the sixth floor in an elevator heard him yell out from the fifth floor and ask if they could shut the gate on the elevator (and thereby make it accessible to him) when they reached the bottom. Why was this changed?
- 5) The next scene featuring Oswald gives us a clue. It shows Oswald eating fried chicken and sipping a Coke on the sixth floor while waiting for the motorcade to arrive. This is repulsive. While fried chicken and a Dr. Pepper bottle were found near the sniper's nest, and initially attributed to the shooter, it was soon discovered that these belonged to Bonnie Ray Williams, and that Bonnie Ray Williams had eaten his lunch just yards from the sniper's nest at the very time the Warren Commission assumed Oswald was putting his rifle together in the sniper's nest. By having Oswald eat the chicken, of course, Williams' problematic presence could be avoided...as could the almost certain fact that Oswald ate his lunch downstairs. (Four of his coworkers--James Jarman, William Shelley, Eddie Piper, and Carolyn Arnold--made statements indicating that they'd seen him downstairs after the elevator incident in which he'd been heard on the fifth floor.)
- 6) But if there was any doubt the creators of the series were out to deceive, the next scene pretty much kills it. They show Oswald pull his rifle--intact--from the paper package he'd brought into the depository. This conceals that the paper package purportedly found in the building--which was already far too large to be the bag described by Frazier and Randle--was still too small to contain the intact rifle, and that the rifle would have to have been dismantled to have been carried in the bag. Perhaps the creators of the show thought a shot of Oswald putting his rifle together with a dime, as proposed by the Warren Commission, would be too confusing to its viewers.
- 7) Oswald then puts a full ammunition clip in his rifle. Three shells were purportedly found in the sniper's nest, and one bullet in the chamber. That's four. A clip holds six. This was probably just lazy film-making, but perhaps the creators of the series were trying to hide that Oswald supposedly set out

to kill Kennedy with the last four bullets in his possession, and that the Warren Commission could never even figure out where these bullets came from.

8) Alas, the assassination scene finally arrives, and doesn't disappoint, in its inaccuracy... Three shots are fired in about three seconds. It seems more than a coincidence that this makes the shooting look relatively easy, when the experts to test Oswald's rifle claimed the bolt was fairly stiff and that as a result it was difficult to fire more than once every two seconds.

In short the series depicted a straightforward shooting--a man in a building killed a man in a car--and hid from its audience that many questions remain about the man supposedly performing the shooting and how the shooting was performed. But this was nothing new.

In the 2003 book *Four Days in November*, Tom Wicker, the long-time White House correspondent for the New York Times and a witness to the chaos of Dealey Plaza from behind the windows of a press bus, offered a mea culpa of sorts, explaining how those so close to a big story like the assassination might miss it. He wrote: *"After long and unhappy consideration of my own and others' failure, I believe we didn't work hard enough to get behind the surface to reality. In the early 1960's, in what still was basically the Washington of the 1950's, still under the spell of Eisenhower the father figure, White House reporters, including me—were not skeptical enough, challenging enough, diligent enough, dedicated enough to the watchdog function of the press, its best reason for First Amendment protection. We didn't work hard enough to find out the facts, and that meant we didn't do our duty as reporters. Many critics—of the press...believe that reporters... 'covered up'...I believe the greater fault was a complacent belief among reporters like me that we were being told what we needed to know and that what we were being told was the truth. 'Handout journalism' still was the custom of the day, until dislodged by the lies of Vietnam and Watergate—dislodged, at that, only among those willing to learn the lesson."*

Pretty powerful words...about as scathing an attack on the complacency of the White House press as one will find from a long-time journalist. Sadly, however, Wicker was not talking about the failure of the Washington press to accurately report the assassination and its subsequent investigation, but its failure to tell the world the sordid details about President Kennedy's sex life. Feel free to scream.

The mainstream media's refusal to take a serious interest in the assassination, and Academia's failure to correct the false history created by the Warren Commission, has helped spark a new battleground for those wishing to expose young minds to alternative perspectives on history: the internet.

Wrestling Over History

The now-defunct website of Dr. Chad Zimmerman and the website of his fellow single-assassin theorist Paul Seaton used to feature nearly identical exhibits. A close comparison of these exhibits, however, revealed that Zimmerman's C7 was at the same level as Seaton's T1. Seaton's less accurate exhibit lives on.

Wrestling Over History

One of the saddest conclusions I've come to as a result of my journey through JFK-land is that the search for truth is really more like a wrestling match. Few of those considered "experts" by the media are open to new ideas. Many would rather rattle off a ten-page article repeating what they think they know than read a five page article expressing a new perspective. I suppose this is only natural. Not knowing what happened in 1963 means one can not be entirely sure what happened afterward. Once one takes their stand, whether it's "the entire government teamed up to kill Kennedy" or "Oswald killed Kennedy and a bunch of America-hating wackos are trying to make us think he didn't," one has ground to protect. In order to protect that ground, many short-cuts are taken.

One of the biggest surprises for me was that there are virtually NO government defenders active in the assassination research community. I didn't come across one person who would say without hesitation that the HSCA got it right. Not one. There were some who claimed to defend the Warren Commission, but even these defenders contend the first shot missed or that Kennedy was first struck at frame 224, conclusions the Warren Commission correctly refused to reach. They would also say they stood by the original interpretations of the autopsy doctors, but then ignore that the doctors initially decided the bullet creating the back wound had fallen out, or that the doctors initially interpreted the "mystery" photo as a depiction of an entrance wound in the posterior scalp. In sum, I found that the supposed

defenders of the status quo are really Lone-Nut Theorists--LNTs. They have their own theories on what happened and why. Some of them even acknowledge there was a cover-up. These men hold that Oswald killed Kennedy, but that LBJ thought it was Castro, so LBJ covered it up even though he didn't need to. Anything but admit the possibility there was a second shooter... that's crossing the line.

Another important point about LNT's... They are not in the habit of correcting one another. As demonstrated on the slide above, they will create contradictory exhibits and offer contradictory opinions on certain subjects. But they rarely publicly disagree, even when one of them knows that what the other one is pushing is terribly deceptive or misleading.

They are also very human, and thus not in the habit of admitting they themselves are wrong... about anything. On January 26, 2010, LNT Paul Seaton finally got wind that I was using one of his images on the slide above to demonstrate the inconsistency of he and his brethren, and had a fit. On the alt.assassination.JFK newsgroup, he wrote:

"I also found on Pat Speare's website, much to my surprise, a jpg which I myself created , about 10 years ago - involving some vertebrae, - that Mr Speare seems to have lifted wholesale from my website. (Can't say I recall him ever stooping to TELL ME he had done so.)

Here's the image :

<http://www.patspeer.com/wrestling.jpg/wrestling-full.jpg>

Here's the page it's on :

<http://www.patspeer.com/chapter19:wrestlingoverhistory>

Spear pontificates :

"By lifting T1 to C7 & C7 to C6 Seaton has misrepresented the level of the back wound in comparison to the throat wound" ...making me sound for all the world as if I were part of some global back wound misplacement conspiracy.

Spear conveniently leaves out the annotation I put next to the damn picture where it appears on my website that: "This diagram - at right - does not use JFK's own xray. I don't know of one that shows the vertebrae. So this is a guide merely to where one might expect to find T1 'on average'.)" Here's the page :

http://www.paulseaton.com/jfk/diagrams/kennedy_graphics2.htm

*I really can't say I have any respect for any individual who uses a graphic of mine *without informing me or asking permission* , leaves off the annotation which explains quite clearly it's just a ball park estimate , & proceeds to spin me as 'misrepresenting' evidence.*

Consequently Mr Spear, I would ask you EITHER to insert the annotation above, ie that " Paul Seaton has clearly stated, on his website, for about the last ten years, in plain English, that this diagram that I, Pat Spear , have so egregiously stolen & misrepresented without so much as bothering to inform him, does not use JFK's own xray. It is, was & always will be merely a guide merely to where one might expect to find T1 'on average'.)" AND ALSO to include a statement to the effect that you apologise for accusing ME of 'misrepresenting' evidence (when in fact it was YOU who was misrepresenting what was clearly stated on my website) OR REMOVE THAT IMAGE FROM YOUR WEBSITE PRONTO.

I have spent many a happy hour here arguing with people of all shades of opinion. I may disagree with their views but in just about all cases come away not doubting their sincerity or good faith.

Just about all cases, Mr Spear."

I present Seaton's reprimand in total, so the reader can see what we're dealing with. Here, he admits that an image posted on his website for 10 years is just a ball park estimate, but wants me to feel bad for demonstrating its inconsistency with other more accurate images. He wants us to believe, furthermore,

that the inaccuracy of this image, which he asserts shows the location of the vertebrae "on average", and his apparent reluctance to establish a more accurate depiction of the vertebrae, has nothing to do with his fervent belief a bullet striking Kennedy in the back from above descended in Kennedy's neck, and is all just a big coincidence. Apparently he, like all too many LNTs, believes he deserves the benefit of the doubt on these issues.

But, after years online arguing with LNTs like Seaton, I feel quite certain no such benefit is deserved.

I reprint below the actual caption to the image on Seaton's website:

Where is T1?

Clearly, above the throat wound.

(This diagram - at right - does not use JFK's own xray. I don't know of one that shows the vertebrae. So this is a guide merely to where one might expect to find T1 'on average'.)

See also

<http://mcadams.posc.mu.edu/angle.jpg>)

...where it can be seen how well this lines up with the back wound location.

Hmm... The caption demonstrates that Seaton was most definitely not just using his image to show those reading his website where T1 was on average, as claimed, but was using it to try and convince his readers that the throat wound was "clearly, above the throat wound." By showing his readers it was "clearly, above the throat wound", moreover, he was using it to convince his readers that the HSCA pathology panel, which claimed the throat wound was higher on the body than Kennedy's back wound, was incorrect, and that those "correcting" the pathology panel's trajectory and placing the throat wound far below the back wound, such as Robert Artwohl, are in fact correct. That Seaton actually LINKS to the thoroughly debunked Artwohl exhibit on the website of John McAdams (see chapter 12) only confirms this analysis.

So, while in the newsgroup post cited above Seaton mocked the notion he is part of a "*global back wound misplacement conspiracy*" the actual caption to the image he was so upset I didn't quote demonstrates that his admittedly "ballpark estimate" was in fact designed to support an easily debunked exhibit on a website designed to convince people Oswald acted alone. There is an expression for this: disinformation. Now, whether Seaton is a knowing agent in this disinformation and whether the small clique of LNTs actively and collectively pushing this disinformation is of a global nature or not, I don't know.

Still, even if he wasn't linking his image to McAdams' website, there'd be reason to doubt Seaton's objectivity. I have yet to come across one LNT whose "ballpark estimates" erred in favor of an argument suggesting a conspiracy. I have yet to come across one LNT who believes the back wound was at the level of Kennedy's spine determined by the HSCA Pathology Panel, let alone determined it to be lower than they asserted based upon a "ballpark estimate." LNTs, in fact, routinely misrepresent the back wound location, and routinely lie about it afterward. As a result, I strongly suspect Seaton's claim his image was just a "ballpark estimate" represents a cowardly attempt to evade responsibility for his ongoing deception re the back wound location.

Pretty harsh words, I know. But take a look at this: [Typical Neck X-Ray](#)

I found the x-ray at the link above in five minutes. It shows that the Adam's Apple is typically found at C5, and not C6, as in Seaton's image. It also shows the base of the throat, Kennedy's entrance wound location, to be adjacent to C7/T1, and not T2/T3, as in Seaton's image.

But perhaps this needs a closer examination...

Where Was the Throat Wound?

Above: an image created by Paul Seaton. Note that he places Kennedy's throat wound at T2 or below. The HSCA had it at C7/T1.

Above: the Kennedy "stare of death" autopsy photo. If the red line corresponds to T2 as on Seaton's image, the blue line signifying the top of the suprasternal notch would be at T4 or below.

At left, a chart in the March 2007 Diagnostic and Interventional Radiology. Only 3 out of 82 patients studied had a suprasternal notch at T4 or below. Most were higher than T3. This suggests that Kennedy's throat wound was at T1 or higher.

Level of the sternal notch in relation to the upper thoracic vertebral bodies in 102 consecutive cases, as determined by T2-weighted midsagittal MRI scans

Level of the sternal notch	Number of cases (%)
T1	3 (2.9)
T1-2	2 (2)
T2	16 (15.7)
T2-3	26 (25.5)
T3	28 (27.5)
T3-4	4 (3.9)
T4 and below	3 (2.9)
Not visible	20 (19.6)

Where was the Throat Wound?

The closer examination depicted on the slide above took about two hours to create. The basic "research" used to create it took about half that time. The ease with which I found this information, and the obvious conclusion drawn from it that Seaton's "ballpark estimate" was wrong and that Kennedy's throat wound was not at T2, suggests, then, that Seaton actually made no real effort to establish where T1 was "on average", but was just blowing smoke to hide his deception.

Still, even so, Seaton was correct about one thing... As I had no real evidence he'd ever actually studied anatomy long enough to establish the actual "average" location for T1 in a man's neck, my original caption claiming he "lifted T1 to C7" did overstate the case. And so on 1-31-2010 I changed the caption in order to smooth his ruffled feathers... Now, did I smooth them? Only time will tell. But last I read he was claiming copyright law protects his right to litter the internet with obviously inaccurate "ballpark

estimates", and that no one has the right use his "estimates" to prove them inaccurate, or inconsistent with the work of others, without his permission.

Apparently, he was unable to recognize the irony of his making these claims on a newsgroup moderated by John McAdams, whose own webpage is littered with dozens of images stolen from conspiracy books and programs, in order to demonstrate their deception. Apparently, he'd forgotten completely that the photos of the "back of the head" witnesses featured on his website were, by his own admission, "stolen" from Robert Groden's book, *The Killing of a President*.

In short, he seemed unaware of the legal concept of Fair Use, which, according to Wikipedia, a monument to Fair Use, holds:

Notwithstanding the provisions of sections [17 U.S.C. § 106](#) and [17 U.S.C. § 106A](#), the fair use of a copyrighted work, including such use by reproduction in copies or phonorecords or by any other means specified by that section, for purposes such as criticism, comment, news reporting, teaching (including multiple copies for classroom use), scholarship, or research, is not an infringement of copyright. In determining whether the use made of a work in any particular case is a fair use the factors to be considered shall include:

- 1. the purpose and character of the use, including whether such use is of a commercial nature or is for nonprofit educational purposes;*
- 2. the nature of the copyrighted work;*
- 3. the amount and substantiality of the portion used in relation to the copyrighted work as a whole; and*
- 4. the effect of the use upon the potential market for or value of the copyrighted work.*

Note further the irony that Seaton is claiming copyright to an image *he* almost certainly stole from someone else, the x-ray, superimposed atop an image he undoubtedly stole from someone else, the Kennedy autopsy photo.

Unfortunately, Seaton's disingenuity on this issue is pretty much par for the course in LNT-land.

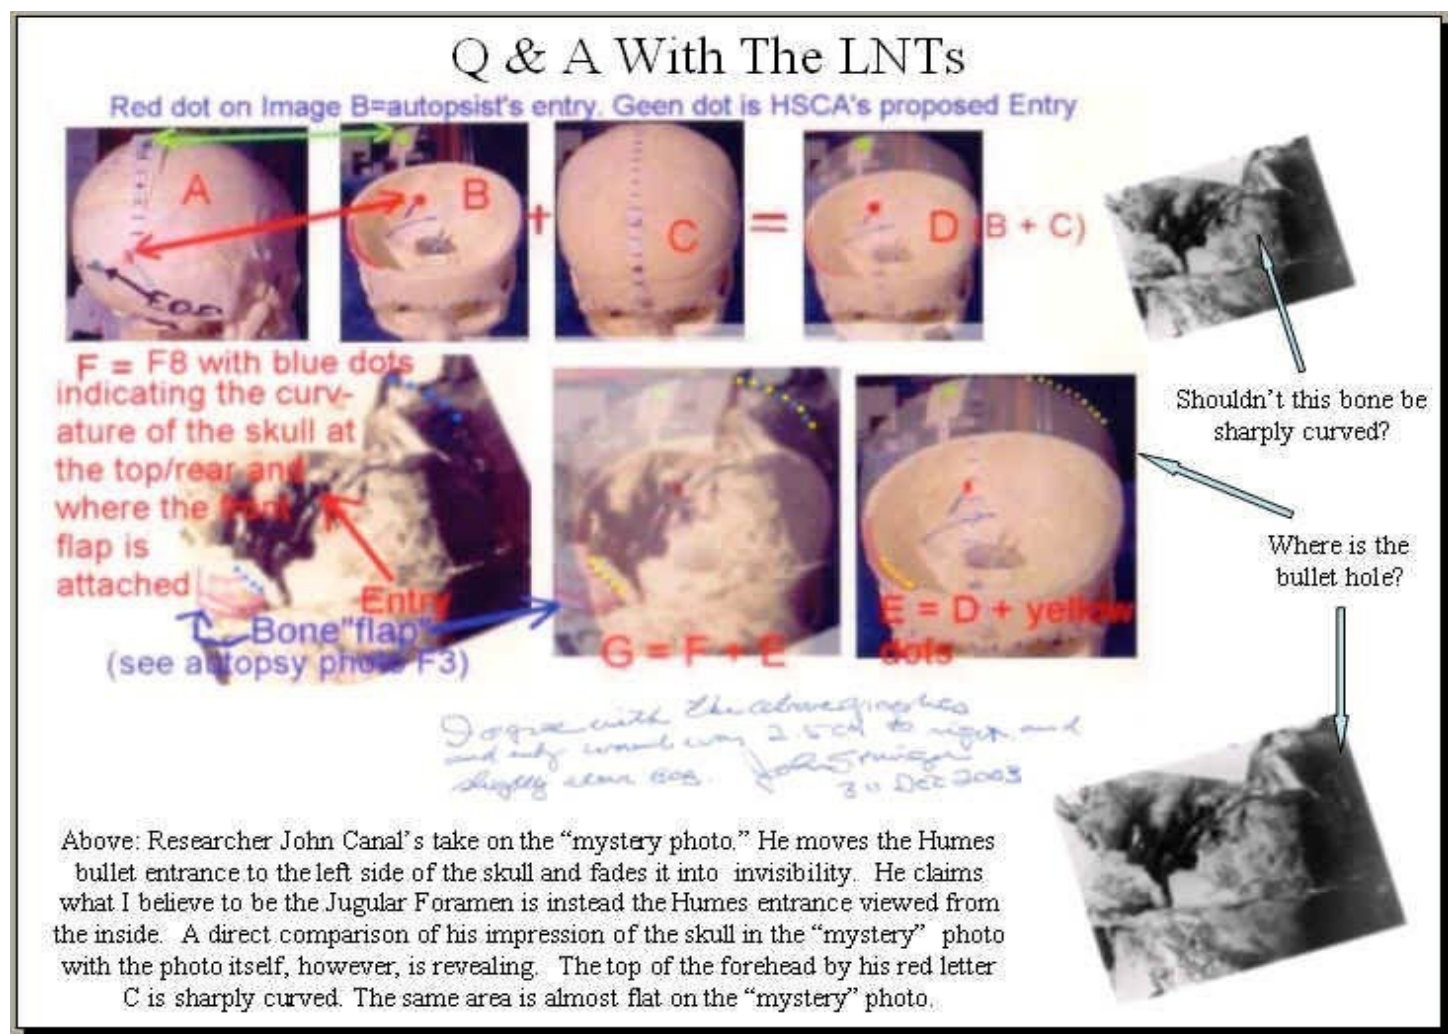

While my examination of Dale Myers' animation in chapter 12c makes it more than clear to most that his work can not be trusted, not one LNT has acknowledged that my work has proven anything. They recite like a mantra that Dale Myers' animation is the most accurate simulation ever done, blah blah blah. One prominent LNT, David Von Pein, after realizing that Dale Myers' response to my criticisms included his admission that the animation presented in *Beyond the Magic Bullet* was distorted, announced that he thought Myers--the creator of the original animation distorted by the program--was probably wrong about this.

Furthermore, while conspiracy theorists fight all day long over shadows on Polaroid photographs, LNTs usually present a united front to the public. From watching TV and frequenting single-assassin theorist websites, one might never know that Gerald Posner and Larry Sturdivan completely disagree on the head wounds, or that Dr. John Lattimer and Dale Myers disagreed on the entry wound on the neck/back. The media, in their well-intentioned attempts to present both sides of every story, have inadvertently propped up the LNTs as defenders of the status quo, a status quo they truly don't believe or represent. Accordingly, I've come to think of the LNTs as really a construct of the media, the anti-conspiracy theorist theorists. The tag-team in white.

Some believe the hype. On August 26, 2006, lone-nut theorist Tom Lowry boasted on alt.assassination.JFK that "I just love being part of gangbuster - team America." In May 2007, on alt.conspiracy.JFK he started a thread on my research which began with "Pat Speer=dufus" and ended up with him swearing "MAY YOU AND YOURS BURN IN HELL FOREVER."

And some just love to hate. One anonymous character on the IMDB forum for the film JFK responded to a 2008 post in which I mentioned the inability of most single-assassin theorists to make sense of the medical evidence with "Sorry. pal. You don't possess the intellect to warrant such pomposity... You are a classic doryphore, calling out petty complaints from the peanut gallery when your own "research" is far more pathetic and delusional than any of the errors made by the WC or the HSCA or even Lattimer. You also engage in uninvited attacks on researchers yourself, so you are no passive "above-it-all" observer of the foibles of others. You also lie about other researchers' work. You don't get off your ass to do a single bit of your own research; you plant yourself at your TV and your computer, getting hard ons from minor errors and disagreements among real researchers and run to your silly website to lie about what you've observed. Of all the conspiracy clowns around here, you are the most pathetic."

It seems I have a fan.

Q and A with the LNTs

When I first put my work online, in November 2005, I was prepared for the worst. I came to so many unique conclusions, I felt that a few of them must be nonsense. I fully anticipated that within days of my going public, I would find a thread on one of the JFK forums about what an absolute fool I was. Instead, I received a number of compliments on my work. Some conspiracy theorists disagreed with my basic approach, because I relied upon the Zapruder film and the autopsy photos, or trusted ___'s

word over ____'s, but few disputed my ability to understand information and come to valid conclusions.

Emboldened, I decided to risk the Lion's Den known as alt.assassination.JFK, a newsgroup dominated by single-assassin theorists and aggressive conspiracy theorists, each with his own take on the assassination and more than willing to argue about it. Here, I had numerous exchanges with long-time researcher John Canal, author of *Silencing the Lone Assassin*. Canal believes that Oswald acted alone, but that Lyndon Johnson, the Warren Commission, the Clark Panel and even the HSCA misrepresented the medical evidence to try and hide the possibility of conspiracy. Eventually, I sought common ground with Canal, and found it. While he adamantly believes that the "mystery photo" is of Kennedy's forehead, and has even persuaded autopsy photographer John Stringer and forensic pathologist Henry Lee of this, he agrees that the photo needs to be studied in more detail by a panel of experts, so that the matter can once and for all be put to rest.

Of course, like all true believers, Canal spent much of his energy trying to convert me to his cause. To that end he sent me his take on the mystery photo, which is depicted on the slide above. This, of course, led me to take an even closer look at the photo, and find more reasons to doubt its current official interpretation. You see, in Canal's analysis the bone to the right of the ruler is the left back section of the skull. Well... where is the scalp that covered this skull? Since the right back part of the skull has scalp apparent, why not the left? Did the doctors reflect the scalp down on just one side? The side of the skull said to be undamaged? My, that would be odd.

Anyhow, here are some typical encounters with Canal...

To dispute my contention that a full-metal jacket bullet shattering upon impact would create a larger entrance than one that did not, and that therefore the 6 mm entrance on the back of Kennedy's skull was too small for an entrance of a 6.5 mm bullet that shattered, Canal responded: "the major pieces couldn't have INSTANTANEOUSLY distanced themselves from the rest of the missile...even by half an inch or so...right? So if those major pieces took, let's say 100 microseconds to separate, the bullet would have been intact for that long...and, as I recall the bullet would probably have traveled about two inches in that time... Moreover, while the nose of the bullet was undoubtedly "deformed" by the time it cleared the INNER table of the skull, an "undeformed" bullet pierced the OUTER table of the skull...and the skull's elasticity, as little as there was, kept the hole in the outer table at the size noted in the report." *(I believe he's wrong. The fracturing of a bullet, or a skull, occurs faster than the speed of the bullet. A fracture is not caused by an impact, but by the deformity resulting from an impact. It's hard to see how this deformity would develop subsequent to the initial impact. When a baseball player hits a ball so hard it tears the cover off, does the cover tear when the ball is on the bat, or 100 microseconds later? Finally, wouldn't skull elastic enough to make bullet holes shrink be too elastic to shatter a bullet?)* At another point, when I mentioned that few forensic pathologists were willing to agree with Larry Sturdivan that the low entrance described at the autopsy is consistent with the brain injuries, Canal said "That's because no one considered a deflection of the bullet as it pierced the rear skull near the EOP...and dry human test skulls didn't reveal any deflecting bullets. The bottom line is that the bullet deflected just above the tentorium, and only bruised the cerebellum. Moreover, the longitudinal laceration is perfectly consistent with an EOP entry and coronal suture exit". *(I believe he's wrong again. In Larry Sturdivan's The JFK Myths he describes how all the bullets fired into the dry test skulls deflected, but only to the left. Canal's also wrong about the trajectory. A bullet entering one inch to the right of the EOP and traveling left to right within the skull is not consistent with a "longitudinal laceration" along the midline.)* But Canal, in his defense, makes no claims of being an expert. When pressed, he will frequently write something like "IMO, the results of the autopsy should be consulted if one needs to know how many rounds hit JFK in the head and the direction of fire... anything else is speculation, most likely based on examination of x-generation copies of autopsy photos

and x-rays and/or statements from witnesses who were at best only indirectly involved in the autopsy.” At other times, when a conspiracy theorist keeps bringing up facts he can’t counter, he calls for help.

Back then, the man who answered Canal’s calls for help was Dr. Chad Zimmerman. Dr. Zimmerman, whose flawed and misleading writings have been discussed in both the "Single-Bullet “Fact” and "Demystifying the Mystery Photo" sections of this work, presents himself as an expert on the medical aspects of the assassination, despite the fact he is not a doctor of medicine, but a chiropractor. (*Of course, I’m no expert either.*) I approached him seeking common ground. I asked him to take a look at the Believing is Seeing slide of my presentation, in hopes he would agree that the bullet fragment on the x-rays is the one seen at the autopsy. As this conclusion was in keeping with his stated beliefs that the autopsy doctors got most things right and that there was no alteration of the evidence, I felt sure he would agree. Instead, he looked at the Solving the Great Head Wound Mystery sections, took great offense that I dared to disagree with his interpretation of the mystery photo (often called F8), and refused to agree with any of my theories. Here are some excerpts from our exchanges...

On 1-29-2006, Zimmerman defended his and Sturdivan’s interpretation of the “mystery” photo: “We could undeniably see the right cheek, right upper trapezius, and the yellow adipose tissue. This was undeniable. Period. The scalp is being reflected down over the forehead, covering the eyes. Again, this was undeniable... The yellow adipose was not seen in all the pictures. If my memory serves correct, it was only seen in one. I’m not quite sure at this time which one showed it. However, make no mistake about it, it was definitely there. It was definitely the front of his face covered by the anterior scalp. The area that CT’s think the neck is located is where I could see the unmistakable blue and white cloth that was on the autopsy table beneath his head. We could see blood on it. It was not his neck, which it would have to be if it were to show the back of his head in the foreground... You think you’ve identified the neck line in the F8 photograph, but you are way off. In the actual photographs, that is the left parietal area. There is a fracture there and congealed blood. Just past that margin is the blue and white striped drop cloth beneath his head with blood smears on it... If you could actually see the photographs, you would need a large eraser and an apology.” When I mentioned that I wanted to seek common ground and would like his confirmation that the bullet slice was really behind Kennedy’s eye, he said “however Pat, you assailed my representation of F8, which is based upon sound viewing of ALL the autopsy head photographs at the archives. You blatantly disregard what can only be one interpretation of those photographs and recycle the same old CT orientation of the photograph... Common ground might only be attainable if you’d actually be able to explain to me why what I call adipose is not, why what is facial skin and cheek contour is not, why smooth upper back skin overlying the trapezius is not. Please do explain to me why Larry and I both agreed on those features without argument?”

On 1-30-2006, he continued his defense of his interpretation of the mystery photo: “Now, I’ve not come across any mention of adipose tissue anywhere. However, it was only seen in one photograph. My memory suggests it was 45. Our feeling at the time was that it was from reflected tissue after the Y-incision. However, it may be from reflected lower neck tissue following the examination of the right lung apex and neck structures. Either way, it is rather immaterial. The adipose tissue was certainly present and could not be anything else... What is important to consider is that the view with the adipose provided additional features not seen in the F8 photograph, particularly to the right side of the President’s head. In addition, we could see the blue and white drop cloth lying on the autopsy table, complete with smears of blood. This is where your neck is supposed to be, but isn’t. Therefore, your orientation can’t physically be. The adipose tissue, which was plainly evident, was not noted during other evaluations of the photographs in the record. I do not know why, but it would be rather immaterial, imo... Why is there such difficulty orienting the photograph? To this day, I do not

know. ...However, during the HSCA interview, they had it oriented properly. I have often wondered if (*HSCA photo-analyst Robert*) Groden ever looked at the color photographs (*Groden has; of course, not only seen the color photographs, but copied them; his color copy is the only one available to the public. Perhaps Zimmerman means specifically the color originals.*)... I can only adequately address the issue of that photograph as such; it is truly something you need to see for yourself. Otherwise, you cannot appreciate through printed words how easily identifiable structures such as the right cheek are. The adipose is not mentioned in the record, that I am aware of, but it exists quite clearly in the bottom left hand side of the photograph. My sketch of that photograph reflects that position.”

Since Zimmerman’s discovery of adipose tissue in the photo appears to have had an inordinate influence on his interpretation of the photo, I decided to do a little reading on adipose tissue. According to Gray’s Anatomy “Adipose tissue is the name given to tissue in which there is an accumulation of connective tissue cells, each containing a large vesicle of fat. In an obese individual these accumulations may occur wherever there is loose fibrous connective tissue. In all but emaciated individuals, however, they are found in certain areas where they act as packing or padding tissue. Examples of the latter are the *orbit* (the eye socket), perirenal fat pad, and various areas of the subcutaneous tissue.” The Encyclopedia of Sports Medicine states further that “White adipose tissue serves three functions: heat insulation, mechanical cushion, and most importantly a source of energy. Subcutaneous adipose tissue, found directly beneath the skin, is an especially important heat insulator in the body.” When one digs even further and actually looks through anatomy books one finds that one of the most prominent locations in which adipose tissue is stored is the Buccal fat pad, which Mosby’s Medical Encyclopedia describes as “a fat pad in the cheek over the main muscle of the cheek.” So, in opposition to Dr. Zimmerman’s contention that the adipose tissue in the photograph is conclusive evidence for his interpretation of the photo, the truth is that fat is stored behind a man’s eyes (which is why starving people have sunken eyes) and in his cheeks (which is why fat people have fat cheeks). In Oncolog, an online publication about cancer research, I found an article about the attempts to harvest the adipose tissue of one part of the body and re-use it in other parts. In the article Filling the Void, by Dawn Chalaire, there was one passage that was particularly noteworthy: “Researchers have been trying for years to develop a good method of repairing the soft tissue deficits that result from oncologic surgery, particularly in the head, neck, and breast. These contour deformities, as they are sometimes called, are typically caused by the removal or scarring of the dermis and adipose tissue.” Well, this confirmed for me that not only is there adipose tissue on people’s faces, but that the loss of this tissue can make one appear deformed. The appearance of adipose tissue in the photo, therefore, is not as significant as Zimmerman contends.

At another point in our exchanges, Dr. Zimmerman reviewed the evidence that led me to conclude the impact at 313 was on the top of Kennedy’s head. Not surprisingly, he dismissed all my evidence. He claimed that Spitz and Fisher’s assertion that missing scalp is indicative of a bullet’s entrance did not apply in this instance. He wrote: “The last paragraph about the missing scalp is not representative of the head injury. They’re referencing a normal entry hole and a normal exit hole, not a giant gaping wound from the explosion of tissue through the fractured skull. This was not a neat wound. It was terribly disrupted and much different from your sample pictures and the normal cases referenced in texts.” (*Spitz and Fisher wrote their book for forensic pathologists, men who are likely to see all kinds of wounds. Zimmerman has no way of knowing whether they intended their generalization about missing skin to apply to “giant gaping wounds.”*) Zimmerman then dismissed the significance of the interior and exterior beveling apparent on the Harper fragment by stating that “the bullet was already gone by the time that happened. The force was imparted by the bullet, but that expansion of tissue happens in all directions and through the weakest points-such as the exit hole (which wasn’t 13 cm).” (*Once again, he has no evidence for this whatsoever. There was beveling on the outside of the Harper fragment as well as the large fragment inspected at the autopsy; this beveling was believed by the*

forensic pathology panel to be related to the exit of the bullet itself, not to the explosion of the temporary cavity.) Finally, he dismissed my assertion that a slap wound to the skull could account for Kennedy's "back-and-to-the-left" movement apparent on the Zapruder film by stating "What you described is a normal phenomenon that cannot explain the rate of his acceleration backwards. It occurs when muscles have resting tone that resists gravity. However, it is not going to throw an entire torso backwards. The neuromuscular reaction is the only mechanism that explains this." *(This is interesting because Larry Sturdivan, to whom Dr. Zimmerman most always defers, no longer subscribes to the neuromuscular reaction theory.)* Finally, he declared "I don't know that I should continue... You've put a lot of effort into this, but I'd have to say that most ballistics experts would deny the possibility of this. Your work is peppered with gross assumption and contradicts much of the evidence. It is based on a patently false presentation of F8, etc..." *(Let the reader be the judge.)*

Later, when I asserted that the large fractures by the supposed exit were much too large to have come from the exit of such small bullet fragments, Dr. Zimmerman returned to his unsupported contention that the supposed exit fractures by the large defect were created by the temporary cavity surrounding the bullet fragments and not by the fragments themselves. He stated "You seem to be thinking that the bullet caused all the holes. The bullet causes directly and indirectly. The expansion of the pressure cavity creates much more damage than the actual bullet. Thus, you can not attribute direct damage from a bullet in that manner. The pressure cavity is secondary to the bullet's passage." He also returned to his contention that books written by experienced military surgeons and forensic pathologists are written about "normal" wounds and should not be applied to Kennedy's wound. Specifically, he dismissed Delorme's assertion that dural tears occur most frequently at entrance by stating: "You keep forgetting about the massive pressure build up of the pressure cavity's formation, which can cause dural tears, fractures, etc. It is an expansive pressure." When I asked him why, if the large defect was created by the explosion of a temporary cavity, there were no concentric rings surrounding this exit, as has been described in forensics journals, he wrote: "No, the bone was gone in that area." *(This ignores that the large bone fragment examined at the autopsy is believed to have been adjacent to the exit and yet showed no signs of concentric fractures.)* When I pointed out that neither the large fragment nor the Harper fragment showed signs of concentric fractures, he countered "The spider web effect isn't something that has to occur over a tremendous distance. Sometimes the radius is only an inch or two. In this case, much was missing for proper evaluation of such." *(This is in conflict with the belief of Dr.s Humes and Boswell that, with the discovery of the Harper fragment, virtually the entire skull had been recovered.)* When I pointed out that the bullet broke into multiple fragments and almost certainly exited in more than one location, and that having multiple exits along the top of the skull would decrease the skull's internal pressure, and thereby decrease the likelihood of the skull exploding from a temporary cavity, he asserted that the large bullet fragments would "exit in close proximity, but not necessarily through the same exit point." *(He ignores that there is a beveled exit on the Harper fragment several inches away from the beveled exit on what he interprets as forehead.)* When I pointed out that these bullet fragments appear to have struck the windshield several feet apart, he responded: "Point of divergence. When physical matter first splits, it is close together. Thus the bullet may not have begun to fully separate until just before the exit." *(This is unlikely since 1) the fragments found in the front of the limousine were the nose and base of the bullet, 2) a middle section representing half the bullet was never found, and 3) fragments from this missing middle were (according to Zimmerman himself) scattered across the skull).*

On 8-18-2006, my disputes with Zimmerman reached a new low. When I tried to point out an inconsistency in his attitude regarding the "mystery photo," in that he generally accepted the original statements of the autopsy doctors over the subsequent panels, and yet he rejected Humes, Boswell and Stringer's 11-10-1966 identification of the "mystery" photo as a photo taken from behind, he surprised me by playing word games. He claimed: "The 1966 inventory does not say that. It says the pictures are

of the entry wound in the posterior skull, which that photo does show from the anterior view looking into the back of the head..." Yep. Zimmerman was thereby claiming that photos purportedly "depicting missile wound over entrance in *posterior* skull, following reflection of scalp" were in fact photos "depicting the anterior aspect of a wound of entrance in posterior skull, taken from the front of the skull, following reflection of scalp over the frontal bone" only the doctors forgot to mention the anterior aspect bit and the scalp reflected over the frontal bone bit. What rubbish! Similarly, he explained the change in interpretation of the photo from entrance to exit between 11-66 and 1-67 by stating "the photo DOES show an entry. It DOES show part of the probable exit. In one case, they call it entry. In another, it is called exit. It just depends on which one you're seeing. Again, the exit is far more readily seen than the entry is in those photographs. It is NOT a clear view of an entry, although it is there." He doesn't even try to explain why on the 11-10-66 inventory, which was, for all they knew, the only time the doctors would ever see the photographs, they failed to mention this exit, which "was far more readily seen" in the photograph, and only mentioned the entrance. He also offers no explanation as to why they failed to mention this entrance in the January 67 review.

My disputes with Canal became equally strange. On 10-8-2006 he asserted that "there was well-intended lying going on about the evidence, UNDOUBTEDLY IN THE BEST INTERESTS OF THE NATION. IOW, they didn't think it was best for the nation that the medical evidence "appeared" to indicate there was another shooter. Call it a conspiracy if you want, but what Baden and a few others did (again, well-intended) would have been nothing compared to the conspiracy to assassinate JFK that you believe in." Canal was thereby stating that it was somehow less paranoid to believe that a series of government experts deliberately lied to cover up evidence in the murder of the president than that Oswald had a still unidentified buddy or two in the Plaza. I fail to comprehend his logic. Perhaps he mistook me for a "massive conspiracy" involving the CIA and U.S. military theorist, a la Oliver Stone, instead of what I am, a "small conspiracy" of unknown origin theorist. In any event, Canal's words made me suspect that I am in fact less of a conspiracy theorist than he. (FWIW, by 2009, much of the single-assassin theorist community had come to agree with me on this point, and had taken to either ignoring Canal's posts on the alt.assassination.JFK newsgroup, or treating his comments with as much derision as those of a conspiracy theorist.)

That people claiming to be "experts" by their nature stretch evidence to suit their needs is proven again and again on the various Kennedy assassination forums, where conspiracy theorist and lone-nut theorist alike distort the evidence to fit their theories and almost no one ever admits they're wrong about anything. That supposedly "official" experts can be guilty of this same behavior is perhaps best demonstrated by the behavior of Dr. Michael Baden, who used the fame gained from being the government's expert on the John F. Kennedy and Martin Luther King killings to write a series of books, and star in a number of HBO specials. He also became an "expert witness for hire," cashing in on his experience by testifying in defense of the likes of O.J. Simpson and Phil Spector, at 100,000 dollars a pop.

After building his life around the case, we should ask ourselves, what are the chances Dr. Baden will ever admit he made an important mistake? Effectively zero. Correct? And the same could probably be said for conspiracy writers like Lifton and Groden and Lane. So where does that leave...us?

Keeping the Magic Alive

Above: an image posted online by single-assassin theorist Tom Lowry in July 2009, in an effort to prove that Kennedy's back wound was indeed well above his throat wound, as first proposed by Dr. Lattimer. Lowry is presumably oblivious to the fact that he has matched up the base of Kennedy's skull at left, with the base of Kennedy's neck at right. Apparently he, as Dr. Lattimer before him, believes Kennedy had no neck to speak of, even though the photo at left proves he did. Sadly, this kind of nonsense pollutes the internet, making it difficult for reasonable researchers and analysts to find common ground.

Keeping the Magic Alive

It leaves us with more argument than debate, with neither side of the argument particularly concerned with refining their arguments to make more sense, and be more in line with the accepted facts. Instead, each side has its own set of facts, and will fight to the end defending those facts, even though many of these facts are not remotely "facts". It's kind of like a staring contest, where both sides have lost their ability to read.

In July 2009, single-bullet theorist and Dr. Lattimer devotee Tom Lowry began posting an image online that thoroughly proves this point. His blind hatred of conspiracy theorists, and his blind worship of men like Lattimer, had led him to push a comparison of photos of Kennedy purporting to demonstrate the location of the wound on Kennedy's back. Lowry insisted this comparison proved the back wound was well above the throat wound in the location described by Lattimer. There was a HUGE problem with this comparison, however. In order to prove Lattimer right, the creator of this comparison had lined up the location of the base of Kennedy's skull on the photo of Kennedy while living, with the location of the base of Kennedy's neck on the autopsy photo. He had thereby created a thoroughly convincing argument against his own theory.

I realized later that this comparison had been posted elsewhere on the net by David Von Pein, a similarly-obsessed single-bullet believer, and Vincent Bugliosi's number one fan. Perhaps I'd seen it

before, but had blocked it out of my mind. When confronted about this on the alt.assassination.JFK newsgroup, Von Pein admitted that he, in turn, had first found the image in the 2006 online posts of Oswald's Game author Jean Davison. Von Pein said further that *"The comparison photo in question (linked below) looks just fine to me. The top black line is being drawn from HAIRLINE to HAIRLINE. So what's the big complaint? Granted, as I've mentioned previously on this newsgroup when talking about that very same photo montage, such comparisons of two-dimensional images that were taken from different angles and distances from the subject are always going to be problematic, and can likely never be ideal in a "Perfectly Lined Up To The Inch" sense (just ask Dale Myers about the difficulty or the impossibility of performing that photographic task). In addition, JFK's head is being tilted back somewhat in the autopsy photo on the right, which could be affecting the comparison to a small extent as well (since Kennedy's head isn't tilted back at all in the left-hand picture). But, in general, it looks like a fairly good comparison montage."*

So there you go... In the eyes of LN zealots, deliberately matching up hairlines in photos taken from different angles, without taking into account that one of the photos shows the head of the subject tilted back and little visible neck, makes for a "fairly good comparison", and a good way of establishing the vertical level of a wound on the back. This is sheer LuNacy. I mean, why not match up another feature--like the base of the neck--whose relative location is comparatively undistorted by the tilt of the head?

Could it be--just a thought here--that that would fail to give LNTs like Von Pein and Lowry their desired result?

This makes it crystal clear that men like Lowry and Von Pein, in order to preserve their faith in a "magic bullet", are willing to cross the bridge to Fantasyland.

The Invisible Smirk

Believe it or not, the three photos above and at right of Oswald on the day of his arrest, and the mug shots at far right, have all been cited as proof that Oswald did indeed smirk repeatedly while in police custody. This is yet another example of the cognitive divide between conspiracy theorists and single-assassin theorists.

While Oswald's face revealed anger and disgust, a smirk is by definition a self-satisfied smile. On what planet, we should ask, can his expressions in these photos be called a smile?

The Invisible Smirk

That Lone Nut Theorists such as Lowry and Von Pein live in some sort of Fantasyland was confirmed yet again in March, 2010. While discussing the prickly issue of whether or not Oswald actually smirked at the midnight press conference on 11-22-63, as so many have claimed, single-assassin theorist David Von Pein posted links to a number of photos which he felt showed Oswald smirking. These photos are on the slide above. While at most two of these photos shows Oswald to be a bit angry at his predicament, at least two of them, IMHO, show him on what appears to be the verge of collapse, a seemingly broken man.

Certainly none of them show him smiling...which is quite surprising considering he is supposedly smirking in these photos, and a smirk, by definition, is "an affected, often offensively self-satisfied smile." The only conclusion to be drawn from this, then, is that men like Von Pein are so blinded by their irrational hatred of Oswald that they see him, even at the heights of his misery, as someone unrecognizable as a fellow human being deserving of compassion, and as someone, in fact, basking in the afterglow of his wicked wicked deeds.

Such people make lousy jurors...

Oswald Smirked?

While it seems obvious to most that Oswald was surprised by the news he'd been charged with Kennedy's murder, his expression upon hearing this news is often reported by those convinced of his guilt as a smirk.

Oswald Smirked?

and successful journalists and crime writers...

While it is believed that ABC News commentator Paul Goode, on the day of the shooting, was the first to describe Oswald's looks of disgust and disbelief as a "smirk", he was far from the last to do so, or the most critical. Jack Ruby, it should be noted, claimed he had no intention of killing Oswald when he ducked into the underground parking garage and shot him, but was compelled to do so by Oswald's smirk. As stated, a smirk is a self-satisfied smile; it is the smile of someone pleased, positively giddy even, by what he is witnessing or experiencing. It is, in this instance, the smile of a guilty man.

While reading Gerald Posner's prosecution of Oswald, *Case Closed*, researcher Jerry Rose spotted Posner's use of the word "smirk" to imply Oswald's guilt, and double-checked the "smirks" in Posner's book against the reports and statements Posner was supposedly referencing. Not surprisingly, Rose found that in every instance, the actual report or statement made no reference to Oswald's smirking, and that Posner had added these "smirks" for dramatic effect...apparently, to make his readers hate Oswald as much as he hated Oswald. While not the serial abuser of "smirk" that was Posner, fellow Oswald character assassin Vincent Bugliosi used "smirk" to similar effect. As do most LNTs... When one does a google search for "Lee Harvey Oswald" and "smirk", in fact, one gets over 1700 hits.

And this despite the fact there is not one photo of Oswald smirking while in police custody... His mouth

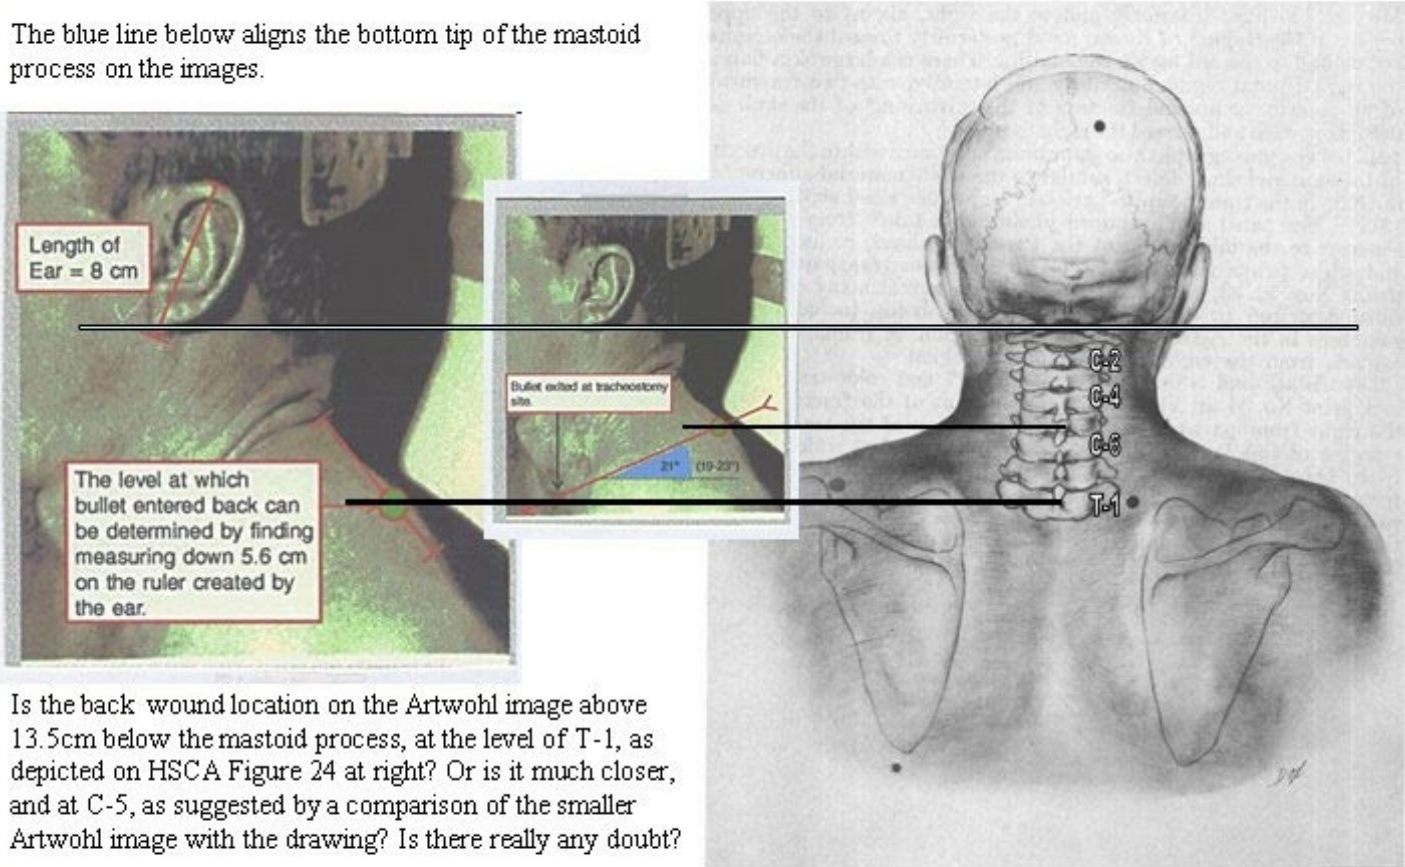

curls upwards at the corners at times, but it is not the upward curl of a smile; it is the upward curl of the mouth of someone in total disbelief, not happiness, not pleasure, but astonishment.

And should one not believe me on this point, feel free to watch the video at the link below.

[Oswald meets the press](#)

The "Nutter" Professor

The blue line below aligns the bottom tip of the mastoid process on the images.

Length of Ear = 8 cm

The level at which bullet entered back can be determined by finding measuring down 5.6 cm on the ruler created by the ear.

Bullet exited at tracheostomy site

21" (19-23")

Is the back wound location on the Artwohl image above 13.5cm below the mastoid process, at the level of T-1, as depicted on HSCA Figure 24 at right? Or is it much closer, and at C-5, as suggested by a comparison of the smaller Artwohl image with the drawing? Is there really any doubt?

In January, 2010, Professor John McAdams confirmed that he believes the image at far left accurately matches up with the drawing at right. He refuses to even acknowledge that the skull in this image is approximately twice as large as the skull in the drawing. Is he bluffing, or just horribly, horribly, wrong?

The "Nutter" Professor

But enough with the small fry. It's time for the Big Cheese. The respectable face of the LNTs, if not their ringleader and head cheerleader, is John McAdams, professor of Political Science at Marquette University. McAdams has been interviewed on television and NPR numerous times, both about the assassination and other events of the day. His website on the assassination is also the number one such website on google. While much of his website is informative, and while I agree with many, perhaps even a majority of its conclusions, its overall tone is somewhat offensive and insulting to those inclined to suspect a conspiracy.

But that's not why McAdams is King of the Nutters. He's King of the Nutters because he sets a horrible

example for others on the alt.assassination.JFK newsgroup he moderates by routinely dismissing EVERYTHING he doesn't want to believe out of hand...and making up transparent and disingenuous excuses to justify his dismissal.

This became clear to me in 2010. While I had been semi-active on the alt.assassination.JFK newsgroup for years, I had had few run-ins with McAdams prior to late 2009, when in an online debate with researcher Jim DiEugenio he attempted to explain away my photo comparison of the paper bag in its various incarnations as the work of a "crackpot". This charge, as you might suspect, led to a less-than-friendly exchange of ideas on his newsgroup. In the end, he refused to waiver from his claim that my using a similar camera and lens to demonstrate that the bag in the news photos was much wider than the bag in the archives was meaningless, and that the ONLY way to compare the "Dillard photo" with the archives photos was to create a simulation using the exact same camera and lens as "Dillard's camera" and lens. (Although newsman Tom Dillard never took a photo of the bag, and I corrected McAdams on this repeatedly, he continued to call the news photos of the bag outside the depository, "the Dillard photo.") McAdams' position, of course, was ludicrous. If we'd been discussing a comparison in which an item appeared to be 3-5% larger than the supposedly exact same item in another picture, that would be one thing. But my photo comparison showed the bag in the news photos to be roughly 25% wider than the supposedly exact same bag in the archives. Nikons equipped with 50 mm or 35 mm lenses don't make middle-distance items look 25% wider than Canons equipped with a 50 mm or 35 mm lenses, and McAdams almost certainly knows this.

This run-in set the stage. On January 9, 2010, McAdams posted his response to a claim by Ben Holmes that the single-bullet theory bullet trajectory runs right through the spine. His response was illuminating. He revealed his woeful understanding of anatomy and the issues at hand by claiming "How in the world did it have to go through the spine if it entered to the right of the midline?" and then asserting that "You can put a dowel right through, between the transverse processes" (of C7 and T1). He then told Ben Holmes that "you are not allowed to just make up your own 'evidence'." This response intrigued me, and on January 11 I asked McAdams if he had any video of him passing a dowel between the transverse processes, and provided links to some of my slides indicating the bullet would not slide right through, as he'd suggested. He responded "Sorry, I'm not going to the trouble just to please you." (This, to me, was as much as an admission that he'd lied, as his doing so would not have been to please me, but to prove Holmes and myself wrong.) He then refused to acknowledge my slides, by claiming that it wasn't possible to see what my point was. To my point that the HSCA portrayal of the back wound was not at C7/T1 as he claimed, but at T1, he responded "Oh, now I know where people get 'C7/T1.' The Dox drawing shows that." This was indeed strange, as I had just used the Dox drawing to show him that the wound was at T1. He then claimed that the significant upward movement of the back wound by the HSCA trajectory panel (see chapter 11) was not in the least bit suspicious. He wrote "You think every discrepancy shows conspiracy. On this planet, it does not."

He then defended the Artwohl exhibit on his website, and his belief the entrance wound location on the Artwohl exhibit was consistent with the entrance wound location measured by the HSCA pathology panel. He wrote: "Pat, you seem to think that Artwohl shows the wound at C5. It doesn't. You are just drawing stuff, not to scale and not knowing what the point is, and announcing this or that conclusion. To get the wound up to C5, you have to reproduce the lateral photo at a much smaller scale than the Dox Drawing. This stuff means nothing at all unless you scale it properly. Ignore your mis-scaled middle drawing, and you can see that Artwohl's drawing makes sense."

That's right. I had shown him the comparison on the slide above. And he had claimed that the giant head on the left of the slide better matched the skull in the Dox drawing on the right than the much smaller skull in the middle. I was horrified. This proved to me that McAdams was either a certifiable LuNaTic or the biggest, fattest, liar this side of Rush Limbaugh.

I decided to see where this might lead. Since he had previously stated that he both thought the back wound was at C7/T1, and that the bullet creating this wound headed 21 degrees downward, as in the Artwohl exhibit, I asked him where this would exit on Kennedy's body. He conceded the obvious--that he did not agree with the HSCA's conclusion that the bullet went slightly upward in the body--but, strangely, refused to concede that he thought the bullet exited at a different location than the HSCA. He either failed to see or pretended to fail to see that a bullet entering Kennedy's back at C7/T1 and descending 21 degrees through 14 cm or so of his flesh, would, by necessity, emerge two inches or so lower on his body. When I tried to get him to at least concede that a bullet heading downwards from C7/T1 would not exit at C7, the exit level on the Dox drawings created for the HSCA pathology panel, by pointing out that it was impossible for a bullet heading downwards in the body to exit higher on the body, he again blew my mind. He responded: "It makes no sense to use 'C7' or 'T1'" when talking about the throat wound." I tried again, with similar results: "Your problem is that you arrive at an 'opinion' and then start to treat your opinion as fact." When I tried yet again to get him to agree that Artwohl's depiction of a downward trajectory was at odds with the HSCA's depiction of the bullet trajectory and wound locations, he answered "HSCA trajectory: yes. Wound location: no."

And from there things only got uglier, and weirder... Like a computer starting to melt down after being asked a trick question in a science-fiction movie, McAdams wrote: "Artwohl is correct" and "You are a Ben Holmes clone!..." and then blamed me for my failure to convince him of anything by claiming my slides are "self-contradictory and confusing..."

When I returned to the subject of the slide above, and asked him how he could possibly think the much larger head at left was a much better match for the Dox drawing at right, when the head at left was twice the size of the head in the Dox drawing, he re-confirmed his LuNacy by writing: "You are just making stuff up. Your own composite shows that the 'right photo' (the larger one) corresponds with the Artwohl analysis. Your 'middle photo' shows the head much smaller than in the Artwohl analysis." He then responded to my request that he correct my errors on the slide and create a proper match between the Artwohl analysis and Dox drawing. He wrote "I don't need to. Your own analysis shows Artwohl to be correct."

When, returning to the original topic, I pointed out that Ben Holmes and I were not alone in our conclusion the single-bullet theory bullet trajectory heads through the spine, and that Dr. Nichols in the 70's and Dr. Mantik in the 90's had come to the same conclusion, McAdams once again showed his closed-mindedness. He responded: "I simply don't believe people like Mantik and Nichols. Mantik is a certified crackpot." When I pointed out that the HSCA panel failed to portray the internal passage of the bullet to show this wasn't true, McAdams took another flight of fancy. He wrote: "They didn't think any such was needed since they had no idea that crackpots like Mantik would raise the issue. Simple fact about the HSCA: they refuted conspiracy notions that were on the table in the late 70's. They could not know what people like Mantik would claim."

This "simple fact", however, simply wasn't true. Nichols was a well-respected forensic pathologist, and had published a paper claiming the bullet trajectory would have to have passed through the spine in the October 1977 Maryland State Medical Journal, within a month of the panel's first meetings. When I then tried to explain the key to Nichols and Mantik's findings, by pointing out that the spinal column and its transverse processes were not adjacent to the back wound entrance but mid-way between the entrance and the supposed exit on the middle of the throat, McAdams once again revealed his ignorance of basic anatomy. He claimed "That's absurd. There is a reason the spine is called the 'backbone.'" He then got nasty: "This is like your 'faked bag' business. You simply make no attempt to model these things with precision."

McAdams' Rib

In January 2010, Professor John McAdams defended the single-bullet theory by claiming that HSCA Exhibit 46, above, "showed a trajectory going between T1 and C7," and insisted that he'd put a dowel between the transverse processes of T1 and C7 on a skeleton, replicating this trajectory. There's two problems with this: 1) Exhibit 46 depicts the bullet going straight through T1, and not between T1 and C7, and 2) the first rib juts out from the spine at T1, and no dowel or bullet could pass between the processes of T1 and C7 without smashing through the first rib (as shown in the anatomy drawing at right).

McAdams' Rib

And the war raged on... When I challenged McAdams to create an image showing the trajectory of the bullet within the body, he once again started in with the insults. He wrote: "It is not necessarily easy to do it. Which is why people like you should probably avoid trying, at least until you learn about modeling." He then justified his refusal to address my slides by insisting "I'm sorry, but your claims are not assumed to be true until disproven. In fact, it's obvious looking at your graphics that you aren't able to model this stuff..." Eventually, he offered what he thought to be the official explanation, and noted that HSCA Exhibit 46, on the slide above, shows: "the trajectory going between T1 and C7, and exiting the throat." This was indeed strange, as McAdams had already pronounced the HSCA pathology panel's trajectory incorrect. But it was more than strange. It was dead wrong. HSCA Exhibit 46 most definitely did not show a bullet heading between T1 and C7, as suggested by McAdams, who'd previously claimed he'd pushed dowels along this path, but a bullet heading straight through the first rib...which was hmmm...conveniently left off the drawing!

When I smart-assedly pointed out that his credibility wasn't high, seeing as he refused to admit a bullet heading downward from C7/T1 would not exit at C7, he replied "It can enter at C7/T1 on a 21 degree angle and exit below the Adams's Apple." He then attacked my characterization of HSCA trajectory analyst Thomas Canning's movement of the back wound upwards two inches from the location

depicted in the pathology panel's drawings, whilst simultaneously claiming he'd received his information from the panel, as a "lie", by first claiming that "that assertion of yours assumes you know how to scale these drawings. It's obvious that you don't" and then acknowledging "Canning used various kinds of data to locate the wound. He apparently did his own measurements, rather than blindly following the FPP. And you, in a very mean-spirited way, say this was a 'lie'." (Well...what would YOU call it when someone says they got their information from a presumably credible source... when the information they offer is clearly at odds with the information provided by that source?)

He then got defensive of Artwohl, claiming that "an ER doctor has vastly better credentials than you to discuss these issues", missing entirely that Artwohl himself was second-guessing NINE forensic pathologists with vastly better credentials than himself to discuss these issues.

He then decided to go on the offensive. Like an angry child, he changed the name of the topic to "Pat Speer believes Kennedy was not hit in the back", and got personal. He asserted "Pat, you are among the die-hard faithful. Only people like DiEugenio accept your claims...I feel like I'm debating with somebody with no ability to read and assimilate information..." He then taunted: "You are in the Jack White tradition of photo analysis" and "You really are Jack White for a new generation," missing entirely that Jack White's studies are often rapidly refuted by his fellow CTs, and that neither McAdams himself nor anyone else had refuted my studies. He then, without any deliberate irony, proclaimed "it's a serious character defect to refuse to answer simple questions and to obsess on your pet obsessions."

Of course, I wasn't exactly a bystander in this kerfuffle. By now, it was clear to me that McAdams' offensive was a ploy designed to hide that he knows damn well that the wound locations in the Artwohl exhibit aren't consistent with the findings of the HSCA pathology panel, and that he simply doesn't have enough respect for the truth to admit it to the likes of me. So I continued pestering him to tell me at what vertebral level he thought the bullet exited Kennedy's throat. His responses grew more and more agitated..."Using vertebra numbers is silly...Below the Adam's Apple...The bullet exited at the knot in the tie...The bullet exited where the gash in the neck shows it exiting...The bullet exited where it is shown to exit in the lateral autopsy photo... It's where the damn photo shows it!" and then, in all caps: "PLEASE QUIT ASKING ME TO USE LANGUAGE THAT MAKES NO SENSE!" And then finally: "THE GODDAMN LOCATION IS SHOWN IN THE LATERAL PHOTO!"

McAdams' failure to answer a simple question--at what level in the neck did the magic bullet magically exit--and acknowledge what is readily obvious--that two bullets entering the same location and traveling in a straight line in opposite directions cannot exit from the same place--was for me an epiphany. For a long time, I'd assumed that other researchers--LN and CT alike--had a similar reverence for the truth as myself and my friends, but that they were just frequently mistaken. I never suspected that a University Professor would spout such obvious nonsense, and tell such obvious lies, rather than admit that he was wrong, or that an exhibit on his website was bunkum.

Boy, was I wrong.

There are brazen liars in this world. People who will happily lie about serious matters, even when they have nothing to gain from this lie, beyond the benefit of keeping a self-serving illusion alive. And I have come to believe that John McAdams is one of them.

In retrospect, I should have suspected as much from the beginning. While I don't dispute that one can be both sincere and a lone-nutter, it's become painfully clear to me in recent years that those frantically *pushing* the LN position on the American public have issues, serious issues--serious enough where they can no longer think clearly.

Yes, I know full well this is what they claim of CTs--that they've got a screw loose somewhere. So let's perform a test. I'll present a statement by a prominent CT, and then a response by a prominent LN, and

you decide which one's got the loose screw.

On January 8, 1995, Harold Weisberg wrote David Belin:

"In referring to the so-called magic bullet, Commission Exhibit 399, and to Governor Connally's wounds in your New York Times op-ed piece of June 25, 1993, you say that 'All the physicians who treated Mr. Connally for his wounds agree that he had been struck by just one bullet, fired from behind.' I go into that testimony in the last two chapters of my first book. It was completed in mid-February 1965. What you say is not true and in saying it you should have known it is untrue."

On January 31, 1995, Belin responded. In a 12-page letter, currently available on the Weisberg Archives website, Belin acknowledged that Connally's doctor Robert Shaw told the Warren Commission he had "No firm opinion" on how many bullets hit Connally, and that, when asked if it could have been two bullets, he responded by saying "Yes, or three." He then quoted Dr. Charles Gregory's testimony, in which Gregory claimed Connally's wounds "could have" been caused by one bullet, and not that he thought they *were* caused by one bullet. He then dragged out the testimony of Dr. Tom Shires, in which Shires claimed that, after operating on Connally, "Well, we all thought, me included, that this was probably one missile, one bullet" and that this "we" included Dr.s Shaw and Gregory.

Belin then pounced, as if speaking to a jury: *"Mr. Weisberg, Dr. Shires did in fact say that 'Well we all thought, me included, that this was probably one missile, one bullet.' (6H109) He then insisted: 'My June 25, 1993 New York Times piece was accurate when I said that 'All of the physicians who treated Governor Connally for his wounds agree that he had been struck by just one bullet, fired from behind.'"*

Well, I don't know about you, but when I read that last bit, my head spun around. Well, not quite, but close... I mean, how could Belin not realize that the testimony he cites in his own defense PROVES, beyond any shadow of a doubt, he was wrong?

Did he misread his own statement--"All of the physicians...agree that he *had* been struck by just one bullet" as "All of the physicians...agree that he *could have* been struck by just one bullet"? Did he, when faced with the obvious truth he'd L-I-E-D in his op-ed piece, have some sort of brain hiccup, which momentarily blinded him, and allowed him to save face through a misreading of his own words?

It boggles the mind, yes?

And this is sadly typical of what one gets when one argues with LNs: nonsense, drivel, $2+2 = 5$ --and you're a liar if you say it doesn't, then more nonsense.

This is profoundly disappointing. While I once had hopes the LN/CT divide could be bridged through an acknowledgment by *both* sides that aspects of what they believe might be mistaken, I no longer believe this is possible...at least not as long as "true believers" like McAdams are running the show.

The Re-invention of Lying

In September 2010, I got another peek inside McAdams' brain. I had noted on the alt.assassination.jfk newsgroup the repeated claims of many LNTs that Mark Lane, Jim Garrison, and Oliver Stone are liars. I pointed out that I considered this a double-standard, as these same LNTs were not remotely interested in the evidence Dr. Lattimer, Gerald Posner, and Vincent Bugliosi are liars. McAdams then defended this particular LN obsession by insisting that Lane, Garrison, and Stone really were liars. He posted a link to his webpage, in which he discussed a number of inaccuracies in Jim Garrison's *On the Trail of the Assassins*. He claimed that by making so many errors, which inevitably exaggerated either the case against Clay Shaw or Garrison's role in the investigation and trial of Shaw, Garrison had revealed

himself to be a liar. I then pointed out that, by McAdams' own definition, Dr. Baden was also a liar, as his books and television appearances have included a number of errors, which inevitably exaggerate both the case against Oswald and his--Dr. Baden's--role in demonstrating Oswald's guilt.

But I couldn't get McAdams to agree with this. It was clear as day--what's good for the goose is good for the gander, etc. But McAdams wouldn't budge.

And then finally, on September 19, 2010, he explained why he felt Baden was not a liar, and confirmed my worst suspicions. He wrote

*"If somebody misstates a strong case against Oswald, we would have to assume he's mistaken and/or confused. If you don't *need* to lie to find Oswald guilty, it's not plausible to believe somebody did."*

He then further excused Baden's persistent mis-statements and exaggerations by repeating

"People don't lie when the truth serves their purposes just as well. He should have checked things out. The fact that he didn't actually shows he was not lying. People who are lying usually calculate carefully what lies they are going to tell (at least if not caught off guard). If he actually sat down to write thinking "I'm going to lie about this," he would check the HSCA material to see what lies he could tell and possibly get away with. But if he checked the HSCA, he would find he didn't need to lie."

Well, great googley moogley! Here was the author of a book entitled JFK Assassination Logic: How to Think About Claims of Conspiracy telling me that, to his way of thinking, those who invent their own facts about the Kennedy assassination are not liars, as long as they claim Oswald acted alone...since those claiming Oswald acted alone do not "need" to lie!!!

What utter horsecrap!

And what a blatant double-standard! Does McAdams really believe Jim Garrison's lazy research and/or convenient memory proves him to be a liar, while, at the same time, Dr. Baden's lazy research and/or convenient memory proves him *not* to be a liar? I mean, to use McAdams' logic, if Garrison's lies had only been as SLOPPY as Baden's lies, we would have reason to believe he wasn't actually lying.

But wait, it gets worse. To a related question, as to whether people with bad memories who make things up can be called liars, or if those telling untruths have to KNOW what they say is untrue before they can be called a liar, McAdams later added:

*"They have to *know* it's untrue before they can be called a liar."*

He, of course, had never demonstrated that Garrison had "known" any of his inaccuracies were untrue! He had concluded that Garrison had misrepresented events and facts that he *should* have known were incorrect, and had concluded from this that Garrison had knowingly lied. And I had offered the same case against Baden. At which time, McAdams attempted to preserve the illusion of Baden's and the HSCA's integrity by claiming that someone with such disregard for the truth that they refuse to read or memorize their own reports before going on TV and babbling on about something for which they are supposedly an expert can not be considered a liar if they did not "need" to lie, i.e. if their original report was something he--McAdams-- had personally agreed with.

He had thereby re-defined the word "liar", which can be used to designate those who tell falsehoods whether they know them false or not, to suit his own needs. Garrison was a liar, whether or not he knew

what he said was untrue, but Baden was not a liar, as he may not have known he was lying.

This erodes any claims McAdams may make to cognitive superiority, IMO. Rather than questioning Baden's and the HSCA panel's conclusions because Baden had revealed himself to be a lazy researcher who preferred to make stuff up, McAdams had insinuated that Baden's and the HSCA panel's conclusions were BEYOND DISPUTE, and that, therefore, Baden's subsequent failures as a researcher and story-teller were irrelevant.

Pardon my French...but that is worse than utter horsecrap, it's freakin' bullshit.

Backfire

Notice the amount of simulated blood flying back toward the shooter in the images at right.

In 2009, an anonymous character going by the name Mag30 began posting videos of his shooting prowess all over youtube. In the discussion of these videos he suggested his ability to shoot HIS Mannlicher-Carcano was indicative of how easy it was for anyone, including Oswald, to shoot a Mannlicher-Carcano. This, of course, was ludicrous. By his own admission, he'd been practicing with his rifle for 30 years. In any event, he eventually posted a video in which he claimed to prove that a skull hit by a bullet would move back toward the shooter. This was far from convincing. The simulated skulls in this video were not attached to a body, and basically exploded upon impact. Even so, they demonstrated, ONCE AGAIN, the likelihood that blood and debris would have flown back toward the shooter, should a bullet have actually impacted the back of Kennedy's head at frame 313 of the Zapruder film.

Images and handwritten notations come from a mag30 video posted on youtube.

Backfire

Some of those devouring McAdams' propaganda may actually be dangerous...

In 2009, an anonymous gun-aficionado using the name mag30th began posting videos of his shooting feats on youtube. (Apparently, he'd been posting these videos for years, but really went crazy with it in 2009, shortly after Barack Obama took office...) Anyhow, some of these videos were of him firing a Mannlicher-Carcano rifle. In some videos he fired for accuracy. In others he fired for speed. In the

comments section of each of these videos, however, the subject matter was always the same. It was a series of complaints about conspiracy theorists, and how none of them knew anything about weapons, and how they'd conned people into doubting Oswald could have fired the shots that killed Kennedy.

As I knew full well that any doubts Oswald could have fired the shots sprang not from the fantasies of conspiracy theorists, but the official record, and the testimony of the men who'd actually tested Oswald's rifle, I joined the discussion, and tried to stop those impressed with mag30th's shooting from believing his shooting prowess said anything about the assassination. Unfortunately, I even expressed doubts his videos were honest depictions of his shooting ability. This led to a tremendous amount of nastiness, and challenges to my manhood, etc. Mag30th then bet me 5,000 dollars he could rapid fire his rifle twice as fast as anyone had fired Oswald's rifle. As the speed at which he could fire his rifle--particularly in that he now admitted he'd had far more experience than Oswald and had in fact been firing bolt-action rifles competitively for more than 30 years--was immaterial to my research, and as I really had no desire to bet such a sum, or even meet the man, I refused. This led to even more attacks on my manhood, etc.

It was around this time that I noticed that some of my comments had disappeared. I challenged mag30th to join a discussion forum where he would have no control over what others could say about his videos. He refused to do so. At this point I stopped responding to many of his attacks. He then posted a terribly misleading video on myths about the Mannlicher-Carcano, pretending for his viewers that these "myths" all derived from conspiracy theorists, when most of them had in fact derived from the official record.

This video was not a waste of time, however. At one point in the video, mag30th shot a couple of simulated skulls, and asserted that their falling to the side after being hit was proof that skulls fall back to the shooter after being hit, and that this disproves the conspiracy theory that the movement of Kennedy's skull after frame 313 indicates the shot came from the front. While these tests were far from convincing on this point--a point which I might readily concede, I might add, should it be clearly demonstrated--they were, not surprisingly, fairly convincing on another point. A significant amount of simulated blood and brain matter splashed back toward the shooter from the entrance location on each of these skulls. Mag30th's tests, therefore, demonstrated once again that the shot at frame 313 would have most logically caused a splash of blood from the back of JFK's head, should it actually have impacted on the back of JFK's head as purported.

So why didn't mag30th note this? Why was he so intent on using his knowledge of guns and his prowess with his rifle to mislead people, when he could have used it to inform?

Well, the bio on his youtube channel gave me a clue. It began:

- *I despise Socialism and the modern day liberal democrat (another word for Socialist), and all the rest of the share the wealth types. Obama represents the Socialist mentality to perfection. Karl Marx would have been proud of him.*

"The American people will never knowingly adopt socialism. But, under the name of 'liberalism,' they will adopt every fragment of the socialist program, until one day America will be a socialist nation, without knowing how it happened."

Norman Thomas, U.S. Socialist Party presidential candidate 1940, 1944 and 1948.

Socialism hasn't worked in 6,000 years of recorded history because it didnt have me to run it. - Ted Kennedy.

Mag30th was thereby bragging that he HATED socialists, and considered the Kennedy family--at one time one of the wealthiest families in America-- socialists. (John McAdams has similarly crowned

President Obama a socialist.)

Sadly, one finds this attitude all too prevalent within those supposedly "defending" history from conspiracy theorists. Just as there are knee-jerk conspiracists, who think every crime committed in the last 60 years is somehow connected to the Bush family, there are knee-jerk single-assassin theorists, who pathetically and desperately refuse to allow that the death of John F. Kennedy could have any meaning, or that he could have died for his country much as Abraham Lincoln died for his country. These people are, in my opinion, disturbed, and possibly dangerous. One of them regularly pollutes discussion forums and youtube with diatribes against Kennedy, and how he was a "spavined hunchback" and a sexual deviant who was totally undeserving of praise or respect.

A typical post from this individual (he who shall not be named):

"The Great JFK Assassination Hoaxing of America is FINISHED! The decline of America didn't occur after JFK was shot, it happened when America voted him into office. JFK WAS A PIECE OF SHIT SIMILAR TO THE PEOPLE WHO DEFEND THAT SHIT AND LEE OSWALD WHO WE SHOULD REMEMBER TOOK OUT THAT GARBAGE! THANKS LEE!"

Such lunacy could be laughed at and ignored should it not be so obsessive and omnipresent.

As a result, I wouldn't be surprised if the next Presidential assassin springs from the ranks of those currently claiming Oswald acted alone.

Chapter 19b: Stuck in the Middle With You

Doctor! Doctor!

"Mystery photo" with Trauma Room One orientation

FIGURE 12: Photograph of JFK's skull wound. This is the only image supposedly taken of JFK's fatal skull wound. It is taken so close to the surface of the skull that it is all but impossible to orient as to which side is up or down, left or right. Three witnesses testified that the scalp was reflected to take a photograph of the spot where the bullet struck the skull, but this image does not show that. Nor is there one photograph in the current inventory that shows the scalp reflected to demonstrate JFK's skull wound.

Back of the head

Neck

Doctor! Doctor!

Over the previous chapters, I have attempted to show how the medical evidence in the assassination of President Kennedy has been twisted again and again by those with an agenda. At times, I have questioned the integrity of the men distorting this evidence. Some of their "errors" are so outrageous in fact that it's easy to believe they were designed to conceal an inconvenient truth. Now, I would like to have finished this study without questioning the integrity of anyone in the research community, men whose support will be necessary for this study to achieve any widespread recognition.

But, as we've seen, it has been impossible for me to do so. Some elements of the research community are so set in their beliefs that they are psychologically unable to adjust to anything new, and heck, my analysis of the evidence is nothing if not something new.

As a result, when I first noticed that no one from the conspiracy research community had identified the Humes entrance on the "mystery photo" I wrote this off to a willful ignorance. It was right there in the photo, but no one seemed to notice it. I assumed this was because most researchers had been so thoroughly snowed by all the discussion of the large exit wound on the back of the head that no one even thought to look for the small entrance wound on the back of the head identified at autopsy.

While at the November, 2005, JFK LANCER conference, however, I noticed something which forced me to reconsider the ‘innocence’ of some of those failing to notice this entrance.

But first a little background... In 1992, Dr. Charles Crenshaw, perhaps the most vocal of the Parkland witnesses, wrote a book, *JFK: Conspiracy of Silence*, which related his memories of November 22-24, 1963, and his theories on the assassination. After its publication, he was widely criticized. Articles were printed in the *Journal of the American Medical Association* suggesting he was a liar—that he’d never even seen Kennedy at Parkland—and so on. After winning a lawsuit against JAMA, he corrected some minor errors in his book, and updated his story to include a section on the lawsuit. He also added a section on the current state of the medical evidence, which was written by two leading members of the research community, Dr. Cyril Wecht and Dr. Gary Aguilar. The new version of Crenshaw’s book, released in 2001, was sold as *Trauma Room One*.

In *Trauma Room One*, on page 281 to be exact, there is a reproduction of the mystery photo, the photo of the President’s brainless cranium which has been the focus of so much of my study. What is astounding about this presentation of the photo, however, is that it is not printed in a way one can make sense of it. It is not printed so that the bone in the photo appears to be forehead, and it is not printed so that the bone in the photo appears to be the back of the head. If one is to believe this photo is of the back of the head, it is, in fact, printed upside down. Even worse, the scalp triangle and lock of hair at the top of the photo, and the neck lines and bullet hole at the bottom of the photo, have been cropped off the photo. This makes it even harder to orient. Suspiciously, this supports the book’s argument that when inspecting the photo it “is virtually impossible to know which side is up, to know which bones are in the image, what part of the skull is being photographed, etc.” It also makes it hard to second-guess the writers when they ask “Is frontal bone or occipital bone visible in this image. Not even Kennedy’s pathologists know for sure.”

Since both doctors had inspected the photo at the archives—Wecht was, in fact, not only the second non-government-affiliated doctor, after Lattimer, to inspect the photos, but had testified before both the Rockefeller Commission and HSCA—one has to question why they would not only make the argument that the photo is indecipherable, but crop it to make it far less decipherable. After all, even single-assassin theorists such as Chad Zimmerman and Larry Sturdivan present the photo un-cropped in their work. The website of single-assassin theorist John McAdams even presents the photo in the back of the head orientation so that his readers can judge for themselves.

Why would two leading lights of the research community misrepresent something so important?

Well, one possibility is that they were protecting their own reputations. Wecht’s disagreement with the HSCA was chiefly over their support for the single-bullet theory; he accepted the higher entrance in the skull and accepted that there was no clear-cut evidence for the Humes entrance on the autopsy photos. Similarly, Dr. Aguilar has built his reputation in part on his belief that the many eyewitnesses describing a large exit at the rear of the head were correct, and that the autopsy report is a sham. It is in neither of the doctors’ personal interest, therefore, to reveal that Humes was right about his low entrance. But are Wecht and Aguilar capable of such “skullduggery”? Would they deliberately mislead the American public just to further their own agenda?

I think not. I find it hard to believe these two men, whose work and statements have been hugely influential in the research community, and who have always pushed for the government to open up the archives and let the truth be known, would go to such lengths to conceal something of such importance.

I suspect that, instead, they had a blind spot.

In re-reading the works of both men, in fact, neither seems to attach much significance to the photo. In Aguilar's excellent 144 page on-line article, *How Five Investigations into JFK's Medical/Autopsy Evidence Got it Wrong*, co-written with Kathy Cunningham in 2003, he devotes 16 pages to the Justice Department's inspections of the autopsy photos in November 1966 and January 1967 (the so-called Military Review) and fails to mention that the mystery photo changed in orientation between the two inspections. This was probably the single-most important element of the inspections. And yet it goes unmentioned. Are we to assume from this that Aguilar deliberately left this out? Similarly, in his 42 page chapter in *Murder in Dealey Plaza* (2000), entitled *The Converging Medical Case for Conspiracy*, Aguilar declared, when discussing the possibility of a missing photo, "no images survive in which JFK's scalp is shown reflected from the skull so as to demonstrate the skull wound." This blanket dismissal of the significance of the mystery photo so alarmed Dr. Fetzer, the editor of the book (who is not a medical doctor), that he felt it necessary to insert an editor's note, reminding the reader "Apart from F8." (F8 is writer Harrison Livingstone's term for the mystery photo.) While the probability exists that Dr. Aguilar, who is in everyday practice an ophthalmologist, was simply being short-sighted, and was referring specifically to the small entrance wound described by Dr. Finck, the fact is, as I've maintained throughout this presentation, that this wound is EXACTLY where Dr. Finck said it was. Why can't Aguilar see this?

Dr. Wecht, for his part, never mentions the mystery photo in his 1993 book *Cause of Death*. There is a passage in the 63 page chapter on the assassination that reveals his blind spot, however. When discussing his first inspection of the autopsy photos, Wecht states "As I reviewed the X-rays and autopsy photographs, I noticed a little flap of loose tissue visible just above the hairline on the back of the President's head...the loose flap very easily could be an exit wound, which would prove there was a second gunman shooting from the front. But even if it is an entrance wound from a bullet, it would destroy the Warren Commission's conclusion that only three bullets were fired."

It's undoubtedly revealing that Wecht's immediate suspicion upon seeing something which could be a wound in the location where the autopsy doctors placed the entrance wound was that it could be an exit wound. This shows that Wecht had little doubt there was an entrance in the Clark Panel's location. Apparently, It never occurred to him that the autopsy doctors could be right and Russell Fisher, the Clark Panel's ringleader, wrong. Wecht's suggestion that the acceptance of even a lower entrance would destroy the Warren Commission's theory is further evidence of this short-sightedness. It is the existence of a higher/cowlick entrance, a wound observed by NOT ONE witness, that would immediately destroy the Warren Commission's conclusions. And yet Wecht fails to argue for the existence of such an entrance. As so many others, he readily accepts that the Clark Panel's red oval-shaped mark in the cowlick is an entrance wound. As with George Lundberg of JAMA, who blindly trusted Humes, it would appear that Wecht blindly trusted Fisher.

I suspect otherwise, however. I suspect that instead Wecht blindly trusted his own experience. In preparing for the writing of this study, I read dozens of papers and books on wound ballistics, most of which included photos of typical head wounds. The red mark in the cowlick noted by the Clark Panel does look a bit like the entrance of a low-speed, small-caliber, bullet. As a result, it may have looked like a typical entrance to Wecht. By no means, of course, is it a typical entrance for a high-speed, military-jacketed bullet, breaking up on the skull.

So maybe the cropping of the mystery photo was just a misunderstanding. On August 1, 2006, Dr. Aguilar responded to my questions about the photo in *Trauma Room One*. He said: "Somewhere along

the line, after the images left our control, someone unknown to us shoehorned the image for reasons I don't understand. At that time I had too many balls in the air and was at risk of dropping a more important one if I paused to catch this one."

Upon my acceptance that Wecht and Aguilar did not deliberately mislead us by publishing a cropped version of the mystery photo, I have to accept the possibility that many of the misleading "mistakes" noted in my study of the evidence, even those by Arlen Specter, Robert Blakey, Dr. Michael Baden and Thomas Canning, were equally innocent.

To this end it should be noted that the doctors testifying in the American Bar Association's 1992 mock trial all made substantive mistakes. Dr. Martin Fackler, testifying for the prosecution, incorrectly asserted that Dr. Robert Shaw only claimed that Connally's back wound was 1 1/2 centimeters long at a point "later on," after he'd already determined it to be 3 cm. This was not true. While Dr. Shaw wrote "3 cm" on a report describing Connally's wounds, he testified from the first that this was the measurement after he cut away some skin around the edges of a 1 1/2 cm wound. Thus, there is no evidence that he ever "changed his recollection," as claimed by Fackler. Similarly, Dr. Piziali testified that Kennedy's head "wound location and head motion shows that the shot was fired from the sixth floor of the TSBD," a statement without any real support. The location and movement may have been consistent with a shot from the TSBD, but came nowhere near "showing" that a bullet was fired from the sniper's nest, as purported. Piziali then said this shot was fired from "88 yards...290 feet", thereby confirming both his lack of basic math skills and lack of familiarity with the case. He then stated that the FBI's tests on Mannlicher-Carcano ammunition showed that it broke up on human skulls. The skull tests were, of course, not conducted by the FBI but by Edgewood Arsenal, a government contractor working with the Army. On the other side, showing that experts on both sides of the case were equally capable of error, Dr. Roger McCarthy testified that the 2 bullet fragments removed from Kennedy's brain were "in fact found in his scalp." He then embarrassed himself further by asserting that "the record is very clear on this."

Experts are mere humans, and busy humans at that, and, as such, prone to mistakes. It's sad, but true.

I suspect that only through this acceptance will we come to any consensus on what really happened on November 22, 1963.

The Power of Suggestion

At left: Fig. 3 in an article by Dr. Cyril Wecht, *Forensic Science* 3, 1974. Above: HSCA Exhibit 52 from the testimony of Dr. Baden, President Kennedy's right lateral X-ray. Arrows added.

A comparison between an illustration featured in *Forensic Science* 3, 1974, and the lateral X-ray upon which it was based demonstrates that Dr. Wecht, the creator of the illustration, was not only confused by the tilt of the skull in the X-ray, as demonstrated by the features pointed out by the blue arrows, but was fooled into thinking there was a large fragment on the back of the head. There is no such fragment, as demonstrated by the red arrow.

The Power of Suggestion

The realization that Wecht's errors were quite possibly related to a misapplication of his extensive experience led me down a dark road of thought. I began to question whether it's possible for those "with knowledge" to ever learn anything new. Does our frame of reference frame our reality?

Let's use Wecht as a case study. On August 23 and August 24, 1972, Dr. Cyril Wecht became the first fully independent pathologist to inspect the autopsy materials. He also became the first conspiracy theorist to see these materials. He reported his findings in a 1974 article in *Forensic Science*.

As a long-time critic of the original autopsy, and as a long-time proponent of forensic science, Wecht undoubtedly had a chip on his shoulder. He resented, justifiably, that military doctors with little forensic experience were chosen to perform the most important autopsy of the century. It was indeed an insult to his profession. When the Clark Panel, made up of better-qualified civilians, (Dr.s Fisher, Moritz, Carnes, and Morgan), had its report released in 1969, and concluded that the autopsy doctors had indeed made major mistakes, one can only assume Wecht shouted "Told you so!" There can be little doubt then, that he went into the Archives prepared to confirm the Clark Panel's basic findings.

Sure enough, in section 3.3 of the 1974 *Forensic Science* article discussing his findings, Dr. Wecht concluded "*Generally speaking, the author's observations and measurements of the wounds and locations of bullet fragments are in agreement with the findings of the Clark Panel in 1968.*" At no point in his paper does Wecht side with the interpretations of the original autopsists over those expressed by the Clark Panel.

Wecht's failure to question the Clark Panel becomes painfully clear when one inspects Fig. 3 in his article. This is a drawing of a skull, purportedly showing the locations of the bullet fragments visible on

Kennedy's x-rays. Wecht failed to properly assess the forward tilt of the skull in the x-ray. As a result the fragment in the middle of the forehead on the x-rays was depicted just above the right eye on his drawing. Wecht described: *"A fragment from this location is reported to have been removed surgically and later subjected to spectrographic analysis."* This helped fuel the mistaken and ongoing belief that the forehead fragment on the x-ray was the one recovered at autopsy. Far worse, Wecht's drawing depicted a large fragment on the back of the head by the Clark Panel's entrance. A close look at the x-ray purportedly studied by Wecht, however, shows THERE'S NOTHING THERE.

Even more intriguing, Wecht KNEW there was nothing there. In his best-selling book, *Best Evidence*, David Lifton reveals that he accompanied Dr. Wecht to the Archives, and that they discussed Wecht's findings both during and after his examination. Lifton recalls: *"During the afternoon session, it became quite obvious that Wecht had great difficulty reading the X-rays--that he couldn't find the entry wound reported by the Clark Panel or by Dr. Lattimer. There was no hole there at all, said Wecht."* Lifton then recalls that he discussed this with others and told Wecht that he shouldn't be looking for a "hole", but for a "subtle shading". He then recalls that Wecht *"was still not able to locate the entry wound."* Lifton then recalls that he measured out the length of thread the supposed entrance would be from the external occipital protuberance and gave this to Wecht to help him find the entrance on the x-rays. He recalls *"Wecht did this, and that was how he found the entrance wound in the back of President Kennedy's head."* (Unstated by Lifton but clear from his account is that Wecht was unable to locate the large fragment purportedly just below this entrance wound; if he'd seen the fragment, after all, he would not have needed to use this thread to find the location of the "hole.") Lifton then cites Wecht's dictation on the "finding" of this entrance. Wecht said *"This is a change in density which apparently is what is referred to in the previous panel as a 'hole.' This either takes imagination or some very sophisticated radiological expertise because it is difficult for me to consider this a hole. In any event, it has to be because it fits the measurements that they give about 100mm from the external occipital protuberance."*

Thus, Dr. Cyril Wecht, under pressure from David Lifton to confirm that the autopsy doctors were wrong, and unable to conceive that the civilians on the Clark Panel were so badly mistaken, ignored his own better instincts and came to not only accept that the cowlick entrance he could not find was there, but to depict the bullet fragment purportedly just below this entrance in his exhibits.

But this was not the only point on which Wecht wrongly deferred to the Panel. When discussing the angle of descent from the back wound to the neck wound, Wecht announced *"Adopting also the Clark Panel's measurement of the vertical position of the exit hole, namely 9 cm below the same crease (although the author was unable to corroborate this measurement from his own observations) we are able to compute the trajectory of the bullet relative to the horizontal and sagittal planes through the President's body at the time he was struck. The downward angle works out to be 11 1/2 degrees..."* As a more accurate measurement would have helped Wecht in his efforts to debunk the single-bullet theory, Wecht's acceptance of the Clark Panel's measurements made little sense, and suggests he'd given the Clark Panel's measurements and conclusions undue weight.

To his credit, Wecht seems fully aware the influence an "expert" can hold over another "expert." An April 19, 1975 memo in the files of the Rockefeller Commission reveals that when Dr. Wecht spoke to the Commission's Robert Olsen, he voiced his displeasure with the make-up of the commission's medical panel. Olsen related *"Dr. Wecht was very unsettled by the identity of the members of the panel. Indeed, he was very angry to the point of shouting and indulging in frequent profanity. He said that almost the whole panel is made up of people from the Washington-Baltimore community; that all of them are under the control and influence of the Chief Medical Examiner of Maryland, Dr. Russell Fisher; that we should have looked elsewhere for impartial experts; that Dr. Fisher is a very strong-*

willed and influential man who has succeeded in getting more Federal grants in the field of forensic pathology than all other doctors in the United States combined...Dr. Wecht readily acknowledged the professional qualifications of all members of our panel. He said that among their fellow professionals each enjoyed a high standing. He stated, however, that it was wholly unrealistic to expect that anybody on this panel would express views different from those expressed by the Ramsey Clark Panel in 1968, which included Dr. Fisher and a radiologist from John Hopkins, Dr. Russell Morgan."

It seems Wecht knew of which he spoke.

Perhaps Wecht was thinking of Paul L. Kirk. Kirk was a respected criminalist, whose post-conviction study of the blood-spatter evidence in the Sam Sheppard murder case (the basis for the TV show and movie *The Fugitive*) brought Sheppard a new trial, and release. Understandably, this greatly upset Samuel Gerber, the coroner whose work helped convict Sheppard in the first place. Gerber is reported to have been so upset by this, in fact, that he retaliated against Kirk by using his influence with his fellow coroners to deny Kirk membership in the American Academy of Forensic Sciences. (This blackballing was only partially corrected by the Academy's naming a yearly award for excellence after Kirk. The Paul Kirk award was first issued in 1979, at which point Kirk had been dead for nine years.)

Or perhaps Wecht was thinking of a more benign form of influence. It goes without saying that people indebted to Fisher would be less likely to question his conclusions than those with a clean slate. It should also be evident that, once fed an interpretation of facts from someone one respects, it is difficult to completely shake off their interpretation and see this set of facts with fresh eyes.

In any event, Wecht's letter to Olsen was far from the only time he complained about the make-up of the panel. An interview of Wecht published in the October 1975 issue of *Physician's Management* shows that in the intervening months he had not only failed to cool down, but had actually heated up. He said the creation of the panel was "*part of the cover-up*" and described the panel's members as "*government sycophants*." He pointed out, and with good reason, that of all the lawyers in America who could be charged with heading an investigation into the CIA's illegal activities, and re-investigating the medical aspects of the Kennedy assassination, President Gerald Ford, the only member of the Warren Commission to write a book on his experience and tie his reputation to the single-bullet theory, picked David Belin, a corporate attorney from Iowa, whose only qualification came from his experience with the Warren Commission, and his being the only member of the commission's staff to write a book on his experience, and tie his reputation to the single-bullet theory.

On May 5, 1978, moreover, Wecht issued a press release in which he similarly attacked the make-up of the Rockefeller Commission's Panel. As two of the panel's members--Dr.s Spitz and Lindenberg--were close colleagues of the Clark Panel's Dr. Fisher at the Baltimore State Medical Examiner's office, and had contributed to Fisher's book *Medicolegal Investigation of Death*, and as yet another--Dr. Fred Hodges--was both a colleague of the Clark Panel's Dr. Morgan at John Hopkins University and the nephew of Morgan's mentor, Dr. Paul Hodges, it is easy to see Wecht's point. But it's worse than that. The other two members of the Rockefeller Commission panel were equally unlikely to question the conclusions of the Warren Commission and Clark Panel. One of these--Dr. Robert McMeekin--was a colleague of one of Kennedy's autopsists, Dr. Pierre Finck, at the Armed Forces Institute of Pathology, and the other, Dr. Alfred Olivier, had actually been the Warren Commission's wounds ballistics expert.

Not that Robert Olsen, to whom Wecht initially complained, was concerned about this, mind you. In the Rockefeller Commission's files there is a Memo to File by Olsen on the creation of the medical panel. It acknowledges that Olsen called an expert at NASA regarding the movements of Kennedy's

head in the Zapruder film, and that this expert referred him to Dr. Charles Stahl at the Armed Forces Institute of Pathology, and that Stahl, in turn, referred him to Dr. McMeekin. It was then decided that a panel should be formed. McMeekin suggested Lindenberg and Spitz. He also suggested Dr. Charles Petty. Olsen rejected Petty, however, as Petty was at that time the Chief Medical Examiner of Dallas, Texas, the scene of the assassination. Lindenberg then suggested Olivier and Hodges. Presumably, Olsen didn't realize that birds of a feather...well, you know.

In 1993, in his book *Cause of Death*, Wecht once again questioned the impartiality of his colleagues. This time, however, it was the impartiality of his colleagues on the HSCA Forensic Pathology Panel, whose reports, much as the Rockefeller Commission Panel before them, pretty much rubber-stamped the findings of Russell Fisher and the Clark Panel. When discussing why he alone among the panel was willing to dispute the single-bullet theory, which he calls "absolute nonsense," and the concurrent conclusion that there was only one shooter, Wecht reveals: *"I believe it's more of a pre-determined mindset that many of my colleagues have that a cover-up or conspiracy of this magnitude by the federal government is unthinkable, or, at the very least, unlikely. Just as lawyers disagree over what a particular law or court ruling means, forensic pathologists frequently have differences of opinion. I have no reason whatsoever to doubt my colleagues' sincerity. However, it should be noted that many of these same people had a long-standing involvement with the federal government--many had received federal grants for research and appointments to various influential government boards. To be highly critical of a government action could end that friendly relationship with Uncle Sam."*

As strange as it may seem, Wecht was being far too kind. It is incredibly suspicious that, of the nine pathologists on the HSCA panel, six--Dr.s Spitz, Petty, Weston, Baden, Coe, and Loquvam--had a professional relationship with Dr. Russell Fisher, whose findings they would be reviewing. Dr. Spitz had not only worked for Fisher, and been trained by Fisher, he'd co-edited the widely-praised book *Medico-legal Investigation of Death* with Fisher.

And Spitz was not the only one reviewing Fisher's findings to have a clear-cut conflict of interest. Dr.s Baden and Weston (along with Dr. Lindenberg from the Rockefeller Commission panel, who'd also worked with Fisher) had contributed articles to *Medico-legal Investigation of Death*.

Which brings us to Dr. Petty... Dr. Petty had not only served as Fisher's assistant in the Maryland State Medical Examiner's Office, he'd edited a book with Fisher, *Forensic Pathology: A Handbook For Pathologists*, which was published in July, 1977, only two months he reviewed Fisher's findings on the Kennedy assassination. Even more shocking, *Forensic Pathology* was written under contract to the Justice Department, under whose guidance Fisher had made his findings in 1968. And even more shocking--yes, even more shocking--of the twelve contributors to *Forensic Pathology* beyond Fisher, four--Dr.s Petty, Baden, Coe, and Loquvam--ended up on the HSCA panel reviewing Fisher's findings.

Now how can this be? Does it make any sense whatsoever that, of the six pathologists to enter the archives on 9-17-77 and review the medical evidence, four had contributed to a book written for the Justice Department only months before? And that this book was edited by the prestigious Dr. Fisher, whose findings they would be reviewing? And that of the remaining two, one--Dr. Earl Rose--was the coroner of Dallas in 1963, and highly unlikely to say anything that might suggest a conspiracy, and cast doubts upon the "innocence" of his former home? And what about the second panel, made up of those who'd already studied the evidence? Does it make any sense that Dr. Wecht was deliberately isolated on a panel in which the other two members--Dr.s Spitz and Weston-- were not only close associates of Dr. Fisher's (and, quite possibly, Dr. Carnes), but had already gone on record as saying the evidence supported Fisher's (and Dr. Carnes') findings?

The answer, of course, is that it does make sense--but only if you accept that the membership of this panel and its organization was designed to protect the reputation of Dr. Russell Fisher and the Clark Panel.

This infection, moreover, was not limited to the pathologists on the HSCA's pathology panel. A quick google search of the panel's chief radiology consultant, Dr. G.M. McDonnell, reveals that he served as a Lt. Col. in the U.S. Army Medical Corps throughout the 1950's, studying the effects of radiation on soldiers and civilians on behalf the Surgeon General of the U.S. Army. It reveals further that by June 1960, while still in the Army, he'd become a member of the National Committee on Radiation Protection and Measurements, a committee set up to determine the safety (and danger) of various doses of radiation. It reveals also that in August 1961 a 195-page report on a 1957 project run by McDonnell, Effects of Nuclear Detonations on a Large Biological Specimen (Swine), was published by the U.S. Dept of Commerce, and that its corporate author was listed as the Walter Reed Institute of Research in Washington D.C.

Now this would be bad enough. McDonnell did not testify before the HSCA, so his background, outside his being a radiologist working at Good Samaritan Hospital in Los Angeles, went largely unexplored. Few, if any, people studying the Kennedy assassination medical evidence realized he'd been a researcher for the U.S. Army, who'd worked out of Washington, D.C.

But it's even worse than that. A 9-28-61 UPI article (found in the Lakeland Ledger) reveals that McDonnell was by that time teaching at the University of California, Los Angeles. This article did more than reveal McDonnell's latest position, however. It revealed that McDonnell had just spoken at the 62nd meeting of the American Roentgen Ray Society, and had been part of a three member panel pushing that the *"dangers to mankind because of atomic tests are 'highly exaggerated.'"* This article reported further that Dr. *"McDonnell said recent measurements have gone to 500 but they would have to go to 'several million' before there would be real concern. He said x-ray workers have been exposed to many times the present readings without ill effects...Dr. McDonnell said some people in India have lived for generations literally on top of a radium bed. 'I don't think they will be harmed at all until someone comes along and tells them they are in real danger,' he added."*

And Dr. McDonnell wasn't the only member of the panel downplaying the harmful effects of radiation. Another member claimed: *"I am much less concerned with the fallout than with the arms race behind it."* This member was Dr. Russell Morgan, of John Hopkins University, the very doctor whose findings on Kennedy's x-rays Dr. McDonnell would later be called on to review. John Hopkins University is, by the way, only 40 miles from Walter Reed Hospital. It seems likely, then, that McDonnell and Morgan were well familiar with one another, and quite possibly close colleagues.

Now, ask yourself, what are the odds that, at the height of the Cold War, three radiologists would appear before a meeting of their colleagues and try to convince them that the radiation released by the military's nuclear tests was of little or no danger to the public, and that 7 years later one of these radiologists would be called upon to study the x-rays of the murdered president who stopped these tests, and that, 10 years after that, another would be called upon to review his findings? I mean, was this all just a coincidence? Or was something else going on, whereby the consultants called upon by the government were not random, but were selected from a small pool of friends and associates known to be supportive of the government's objectives?

In any event, it's not just a coincidence that the HSCA rubber-stamped the Clark Panel's conclusions on

the head wound. In his 1998 book *Real Answers* HSCA Deputy Chief Counsel Gary Cornwell reveals that he was all set to aggressively interview Dr. Humes and expose Humes' supposed mistakes--including that he'd misidentified the location of the entrance wound on Kennedy's head--but that the "*committee's doctor*" (presumably Dr. Baden, but possibly Dr. Petty) told him he couldn't do that, as Humes was a "*respected man*." This doctor then warned Humes of Cornwell's plans, and convinced Humes to acknowledge he'd made a mistake regarding the entrance wound location (a confession he subsequently recanted) in exchange for Cornwell's taking it easy on him, and not attacking his reputation. Well, if this doctor was Baden, as one might only assume, seeing as he was the only doctor on the pathology panel in regular contact with those running the committee, it's clear that protecting Humes' reputation was the last thing on his mind, and that his true goal in warning Humes was to get Humes to back off on his claim there was no entrance wound in the cowlick, and thereby prevent possible damage to the reputation of DR. RUSSELL FISHER.

And the proof of this is that, in Baden's 1989 book *Unnatural Death*, he shows little regard for Humes' reputation. No, check that--he TRASHES Humes' reputation. The autopsy conducted by Humes was a "*disaster*." Humes "*had never autopsied anyone with a gunshot wound*." Humes was "*not competent for the job*." Humes understood, without specifically being told, "*that he wasn't supposed to do a full autopsy*." "*He was there to please his superiors*." "*He felt it was beyond his powers to describe the wounds*." "*The autopsy was woefully inadequate*." "*Humes couldn't understand what had happened to the head bullet*..." "*The autopsy is not finished until you work out the bullet tracks along with the exits and entrances*. Humes explained that he was in a hurry, that the family was waiting for the body." Humes "*burned his notes*." "*It is not clear what facts he used from his original notes*." "*The result was an autopsy report filled with errors, sins of omission and commission. Bullets weren't tracked, the brain wasn't sectioned, the measurements were inaccurate, the head wound wasn't described. The weights and measures of body organs made no sense*."

Now this was not the random destruction of another man's reputation, mind you, but the willful destruction of a man's reputation in order to prop something up in its place. Having explained to his readers that Humes was incompetent and not to be trusted, Baden then thrusts upon them the one point he almost certainly knows they'd question if he was to tell them all the facts. Humes "*didn't shave any hair from around the head wounds in order to examine them. The wounds were photographed through the hair*." "*The head is only five inches long from crown to neck, but Humes was confused by a little piece of brain tissue that had adhered to the scalp. He placed the head wound four inches lower than it actually was, near the neck instead of the cowlick*." Baden never tells his readers that not only did Dr. Boswell, Dr. Finck, and autopsy photographer John Stringer also tell his panel the wound was where Humes said it was--and that there was no wound in the cowlick (where the great Russell Fisher said it was)--but that Finck had had a meeting with Baden's panel in an attempt to convince them of this fact, and had stuck to his guns despite Baden's badgering.

Dr. Wecht's suggestion that money played a role in the pathology panel's decisions is also understated. That the economic interests of doctors can influence their conclusions has been confirmed numerous times. By way of example, a survey by Mildred Cho and Lisa Bero published in the March 1996 *Annals of Internal Medicine* revealed that 98% of the studies of drug effectiveness funded by the drug's manufacturer came to a favorable conclusion, while only 76% of the studies funded by independent sources shared this conclusion. This suggests that a drug company is 12 TIMES as likely to avoid an unfavorable conclusion about its product if it funds the doctors making the conclusion. A survey published in the October 1999 *Journal of the American Medical Association* was almost as discouraging. It found that a study sponsored by a drug company was only about 8 TIMES as likely to avoid an unfavorable conclusion on its new drug than a study sponsored by a non-profit organization.

Perhaps, as suggested by writers Sheldon Rampton and John Stauber in their book *Trust Us, We're Experts!*, the physician's motto of *"First, do no harm"* should be changed to *"First, do no harmful publicity."*

Of course, money is not the only motivating factor that can consciously or subconsciously color a doctors' perceptions, conclusions, and testimony. None less than Dr. Baden, in his book *Dead Reckoning*, has noted: *"Physicians may be the worst witnesses. They are often swayed by whoever asked them to be an expert. If that lawyer is smart enough to ask their advice, they conclude, he must know what he is doing. That being the case, physicians therefore adopt whatever the lawyer tells them as the facts of the case and become, if only subconsciously, an advocate for the lawyer rather than an independent adviser."* The ease with which scientists and doctors can be seduced into supporting otherwise unsupportable conclusions by lawyers is such common knowledge, in fact, that it was the subject of a well-received book, *Gallileo's Revenge*, by Peter Huber. Huber, a former law clerk to Supreme Court Justice Sandra Day O'Connor, was so disturbed by what he found that he was led to conclude *"Malpractice by scientific and medical professionals is not only tolerated but encouraged, so long as it is solicited by lawyers themselves."* Damning words indeed.

But one doesn't have to question the motivation of doctors to question their ability to see evidence with absolute clarity. The susceptibility of doctors to innocent suggestion, and their innocent resistance to data challenging this suggestion, has also been studied. In 1972 Dr. David Rosenhan of Stanford University, along with seven recruits, checked themselves into psychiatric hospitals. These eight subjects told the hospitals they'd heard voices in their heads repeating words with no apparent meaning. After admission, however, the subjects claimed the voices had stopped, and started acting perfectly normal. The psychiatrists "treating" these subjects, however, routinely interpreted the "normal" behavior of these subjects as additional signs of their psychopathology. As a result, the patients were hospitalized for an average of 19 days, and fed an average of over 250 pills. Seven of them were diagnosed as being schizophrenic, and one as being bi-polar. Rosenhan himself was confined for almost two months. After his release, Dr. Rosenhan began the second half of his study. He told the hospitals of their mistakes, and that he'd be sending them more fake patients over the next three months. During this period 193 patients were admitted to one of the hospitals. 20% of these patients were identified by at least one staff member as being one of Dr. Rosenhan's "fake" patients. In fact, none of them were. Dr. Rosenhan had simply planted the suggestion that there could be fake patients in the minds of the hospital's employees, and they had begun to see them everywhere. Whereas not one of the original 8 patients pretending to hear voices had been spotted as a fake, over 40 actual patients were subsequently, and inaccurately, accused of being fakes.

The resistance to new perceptions, once one's frame of reference has been set, had been tested even before Rosenhan. In 1949, in a landmark study performed by Jerome Bruner and Leo Postman, subjects were flashed playing cards, some of which had a wrong color, i.e. red spades, black diamonds. They found that people would always recognize a normal card within 350 milliseconds, but would fail to recognize what they called a "trick card" 10% of the time, even when given a full second. They found, furthermore, that as one was exposed to more "trick cards," the speed in which one could identify the trick cards drastically improved.

Historians have also studied this resistance. In 1962, Thomas Kuhn published a landmark work of his own, *"The Structure of Scientific Revolutions"*. As part of his study, Kuhn looked at the time lapse between the development of new scientific theories and their general acceptance by the scientist's peers. He found, amazingly, that very few scientists, once committed to a theory, ever change their minds and embrace the findings of another scientist, even if this other scientist's new theory better

answers the questions answered by their old theory. Kuhn relates:

"Copernicanism made few converts for almost a century after Copernicus' death. Newton's work was not generally accepted, particularly on the Continent, for more than half a century after the Principia appeared. Priestley never accepted the oxygen theory, nor Lord Kelvin the electromagnetic theory, and so on. The difficulties of conversion have often been noted by the scientists themselves. Darwin, in a particularly perceptive passage at the end of the Origin of the Species, wrote: 'Although I am fully convinced of the truth of the views given in this volume..., I by no means expect to convince experienced naturalists whose minds are stocked with a multitude of facts all viewed, during a long course of years, from a point of view directly opposite to mine... But I look with confidence to the future,--to young and rising naturalists, who will be able to view both sides of the question with impartiality.' And Max Planck, surveying his own career in his Scientific Autobiography, sadly remarked that 'a new scientific truth does not triumph by convincing its opponents and making them see the light, but rather because its opponents die, and a new generation grows up that is familiar with it.'"

So...if you've made it this far and have failed to be convinced by any of my arguments, I can only say that I hope you die soon... Just kidding. No, really, if you think I'm wrong about everything, but have nevertheless made it this far, I'm delighted to have entertained you on whatever level I've entertained you. Particularly in that there remains a chance I can convince you of something.

Let's go back to Dr. Wecht. In 2003, in an article co-written with Dr. David Mantik, Wecht publicly reversed his position on the 6.5 mm fragment he'd once portrayed on the back of Kennedy's head. This article, published in a compendium entitled The Assassinations, presented an image of Kennedy's computer-enhanced A-P X-ray with the caption *"The 6.5 mm (white) object seen within the right orbit is almost certainly a deliberate artifact that was added to the original X-ray; the latter was then lost or destroyed."* Above this image is an image of Kennedy's computer-enhanced lateral X-ray. It has an arrow pointing to the back of Kennedy's skull, where Wecht depicted the 6.5 mm fragment in his 1974 article. Only this new image is captioned: *"The arrow at the rear identifies the corresponding site for the 6.5 mm fragment."* It seems clear from these captions then that Wecht now readily acknowledges that he fails to see the 6.5 mm fragment at this site. While I would like to show Wecht my own work and convince him that the large fragment on the A-P x-ray is actually not an artifact, but the fragment behind Kennedy's right eye described and removed at autopsy, it is nevertheless comforting that some "experts", some time, can be convinced to change their opinions.

I suppose, in this light, I should also take comfort that Larry Sturdivan has changed so many of his opinions, and that Dr. Lattimer, while sure of Oswald's guilt to the end, nevertheless changed his opinion on the entrance wound on the skull. I'll work on that. Taking comfort.

Cognitive Thinking 101

In the image at left, the middle square on the side in shadow appears to be orange, and the middle square on the side in light appears to be dark brown. This, however, is an illusion. The squares are in fact the exact same color, and only appear to be different because the brain perceives colors in shadows differently than when not in shadows.

This is demonstrated at right. Black rectangles have been placed atop the image to black out the squares neighboring the middle squares. The squares are now the same. And not only does the orange square now appear to be brown, but the dark brown square on top is now the same shade as the brown square at the bottom of the image.

Even though we know this, however, it's hard for us to look at the image above and NOT see the square in light as dark brown and the square in shadow as orange. We're stuck.

Cognitive Thinking 101

But it'll be hard. Real hard. Yes, unfortunately, I now suspect that the divide between what the evidence suggests in the Kennedy case and what many believe stems not from people refusing to change their minds, but from people refusing to use their minds. (Or, at least, the fully rational part of their minds.)

People get used to what they know, without realizing a large part of what they "know" is what they've been told. People used to thinking that communists are insidious and will stoop to anything to undermine American life find it hard to believe a communist sympathizer like Oswald could be innocent. Similarly, people used to thinking an ambitious "loser" like Oswald is likely to be desperate and dangerous find it easy to believe Oswald could just wake up one morning and decide to kill the President he admired, and then pretend that he didn't do it. Thus, Oswald's guilt seems perfectly reasonable or even readily apparent to those with a rightward bent, as well as those from the upper castes of society, ever-fearful of what they believe to be the jealous rabble down below.

This bias undoubtedly clouds their thinking. While many will argue that their opinions are based purely on the evidence, they fail to see that they have a built-in bias that filters out the evidence they consider unimportant. They will say that Oswald's palm-print was on the rifle, without considering that this evidence is tainted by the strange fact that the palm print was not identified until after the FBI said

there was no such print, and that the Dallas detective who found this print, Lt. J.C. Day, said it was an old print. They will say that Howard Brennan identified Oswald as the shooter, without admitting that Brennan's refusing to ID Oswald in a police line-up, but then later saying he knew it was him all along, and then later changing his story about how many shots he heard and where he was looking when he heard these shots, damages his credibility.

The intellectual integrity of single-assassin theorists is rarely as suspect, in fact, as when they hold Brennan up as their star witness. While the literally dozens of witnesses to state the first shot struck Kennedy and/or the last two shots were closer together than the first two are inevitably dismissed by these theorists due to "eyewitnesses not being credible" they nevertheless hypocritically persist in using Brennan to prove Oswald was the shooter in the sniper's nest. This signals that there is some sort of disconnect going on...that their emotional response to the case--that it must have been Oswald--has led to their unplugging their rational minds from its wall socket.

A February, 2009 online discussion with single-assassin theorist David Von Pein further illustrates this point. On the IMDB Forum for the film "JFK" Von Pein kept citing a 2003 ABC News poll as evidence the majority of Americans think Oswald shot Kennedy. I tried to correct him on this, and point out that the poll's question *"Do you think Lee Harvey Oswald was the only gunman in the Kennedy assassination, do you think there was another gunman in addition to Oswald there that day, or do you think Oswald was not involved in the assassination at all?"* was misleading. I argued that by saying *"not involved in the assassination at all"* at the end, the questioner misrepresented this as the only remaining alternative and pressured people convinced that Oswald was somehow involved to pick one of the first two options. I likened this to asking people *"Do you think the Warren Commission was created to deceive, do you think the Warren Commission decided on their own to deceive, or do you think the Warren Commission told the American people the truth ABOUT EVERYTHING?"*, a question that, in my opinion, would lead people to overwhelmingly state that the Warren Commission deceived the public. But Von Pein would have none of this. He continued to claim, and continues to claim, that ABC's poll showed that 32% of Americans believed Oswald was the lone gunman, 51% thought Oswald was one of multiple gunmen, 10% had no opinion, and only 7% of the American people thought someone other than Oswald fired from the sniper's nest in the school book depository.

This was obviously wrong. If 83% believed Oswald fired from the book depository, and only 7% believed he did not, then it follows that for every conspiracy theorist suspecting that Oswald was framed, TWELVE people thought Oswald was guilty. This is ludicrous. If, as Von Pein claims, only 7% of the American people thought then and continue to think Oswald innocent of shooting Kennedy, then why are he and his fellow single-assassin theorists so driven to convince others of Oswald's guilt? I mean, far more than 7% of the American people think Hillary Clinton killed Vince Foster, or that AIDS was designed by the CIA, and you don't see a nation-wide movement of journalists, historians, and "researchers" arguing that these people are wrong. Such wild theories, when held by only a small minority of people, are just ignored. Furthermore, if by 2003 only 7% of Americans thought there was anything to the possibility raised by Oliver Stone's 1991 film JFK--that Oswald was framed by the American government--then where in the world do people like Vincent Bugliosi and Von Pein get off blaming Oliver Stone for misleading the American people? Are we to believe that BEFORE the movie "JFK" hit the theaters, far FEWER than 7% of the American people thought Oswald innocent of killing Kennedy?

A year later, as part of his ongoing campaign to paint those believing Oswald innocent of killing Kennedy as kooks, Von Pein started up on this again. This time, however, I asked him WHO the supposedly 51% of the public thinking Oswald fired shots as part of a team thought Oswald was

working for. For this, he referred me to yet another poll, one in which 34% of the public said they believed the CIA was involved. This makes Von Pein's assertion only 7% of the public thinks Oswald innocent of shooting Kennedy positively bizarre. Could he really believe that at least 27% of the public believes Oswald shot Kennedy as part of a CIA plot? Could he really believe those thinking Oswald fired shots on behalf of the CIA outnumbered those thinking he was a patsy by a ratio of almost 4 to 1? And if so, how could he or his hero Vincent Bugliosi possibly believe the public was remotely swayed to believe such a thing by Oliver Stone's movie JFK, or any other film or publication? Outside a few researchers claiming Oswald was part of a CIA mind-control program, and a Manchurian Candidate-type assassin programmed by the CIA, no one, and I mean no one, in the conspiracy research community believes Oswald was an assassin for the CIA. I have talked to hundreds of non-buffs over the years, and can absolutely assert that this suspicion is next to non-existent in the non-buff public as well. Von Pein's assertion that as many as one out of every four Americans thinks Oswald was a hit man for the CIA is just plain wacky, and is proof positive that his thoughts on the assassination are not grounded in anything resembling reality.

And when I pushed him on this...he admitted as much. On March 4, 2010, on the alt.assassination.JFK newsgroup, he admitted: *"if I WERE to disbelieve that "7%" ABC poll, where does that really lead? I'll tell you where -- such a belief leads to a vast MAJORITY of Americans actually falling into "Kookville."* Yes, you read that right. In Von Pein's mind, his acceptance of that poll equates to his rescuing the vast majority of Americans from "Kookville." He doesn't want to believe HE is in the vast minority, so he trumpets flawed polls from years past to convince himself he is not, even though his acceptance of this poll leads to the inescapable conclusion that a substantial percentage of Americans believe Oswald to have been a hit man for the CIA, something he KNOWS isn't true.

One can see such cognitive dissonance, or "cognitive thinking", if you will, at work in our everyday lives. At times we all lack the ability to step outside our normal frame of reference and look at something with a fresh pair of eyes. On the image above, for example, the middle square on the side of the cube in shadow appears to be a much lighter color than the middle square on the side on top. Even after blacking out the squares surrounding these squares, and realizing that they are both the same shade, I still see the one in shadow as much lighter than the other every time I look at the image. My mind is stuck in its way of interpreting color. I propose then that many of those interpreting evidence in the Kennedy case are similarly stuck.

I have an anecdote that further illustrates this phenomena. One day, some years back, I was talking with a woman of above-average intelligence. She was telling me about a friend who'd purportedly had terrible luck with the lottery, and had bought over 150 "scratchers" without ever winning a dollar. When I pointed out that her friend was obviously exaggerating, as the odds of winning back a dollar at that time were 1 in 10, this college-educated woman with two degrees said no, that's what her friend said, and she believed her friend. I probably should have let it drop, but this annoyed me. I whipped out a calculator, and got her to agree that the odds of not winning on each scratcher were .9, and then multiplied .9 by .9 by .9 etc., and showed her that there was effectively a 0% chance someone could buy 150 scratchers in a row without encountering a single winner. Perhaps as a response to my arrogance, she STILL refused to believe that her friend was exaggerating her bad luck. Her friend had told her the truth and had had an amazing run of bad luck. Period.

The "Monty Hall Problem" presented in the movie "21" provides yet another example. In the problem, modeled on TV's Let's Make a Deal, someone is offered a choice of 3 doors. Behind one there is a prize. After the selection of the door, however, the host, who knows which door has the prize, opens up a door that has no prize, and then asks the contestant if he/she would like to stick with his/her original

selection, or choose the other remaining door. Intuition tells most of us that the odds of choosing the right door at this point are 50/50 and that maybe we should stick with our first choice. But our intuition is wrong. The odds of our first choice being right are only 1 in 3, while the odds of the other door being right are 2 in 3.

The explanation is simple but, for some, incredibly hard to follow. (It took me awhile to figure it out myself) It goes like this. Since, the odds of your first choice NOT being right are 2/3, the other 2 doors represent a 2/3 probability of having the prize. When the host opens one of these doors, however, the remaining un-opened door becomes the sole bearer of this 2/3 probability. This is clear, right? And yet, we're so conditioned to look at two doors, and assume the odds of something being behind one of those doors is 50/50, that many can not accept this explanation. They just can't grasp it. To one acquaintance, an entirely different woman from the one described above but one equally intelligent and college-educated, I tried to demonstrate the concept by using sugar packets instead of doors. I put seven sugar packets on a table. I told her that one of them held a prize. She picked a packet. Playing the role of the game show host, I then excluded prize-less packet after prize-less packet, until there was but one packet beyond the one chosen. I then offered her a choice between these two. Even though the remaining non-chosen packet had effectively passed a series of 5 tests indicating it could hold the prize, and the chosen packet was entirely untested, she couldn't see how this effected the odds, and still thought her first choice had a 50/50 chance of being correct.

I believe these examples correlate to the resistance of some to the possibility of a conspiracy. Much as the first woman, they resent the know-it-alls in the conspiracy research community telling them what they should think. Much as the second woman, they've made their choice and are sticking to it, no matter how much the odds add up on the other side. They see that there is evidence implicating Oswald in the crime, but fail to see how most all this evidence is tainted, and that the Zapruder film and eyewitness evidence suggests at least two shooters. They fail to see how the obvious fact that both the Warren Commission and HSCA skewed the evidence to their advantage suggests that maybe, just maybe, both of them knew that the evidence never pointed to Oswald as a lone gunman, and yet pretended it did for political reasons. Similarly, they fail to see how the vastly different conclusions of the autopsy doctors and HSCA medical panel demonstrate the likelihood that at least one of these groups was incompetent, or less than truthful, either of which suggests the case is far from closed.

From the thousands of online discussions I've had with single-assassin theorists, it's also clear that they just can't perceive of a world in which the FBI could be wrong and conspiracy theorists like Mark Lane and Oliver Stone could be right. In direct opposition and yet perfect congruity with the Kennedy cultists they so despise, their world view revolves around their fervent belief that Jack Kennedy was a bad president, or a playboy, or an anti-communist, or all three, and that, in any event, no right-winger could possibly have conspired to kill him. To them, conspiracy theorists are not just wrong, but "dangerous."

They are stuck in a box and they can't see their way out.

Their cognitive dissonance is deafening.

Still, one cannot assume from the cognitive thinking of the right that the world they see is upside down, and that, in reality white is black, and black is white, and right is wrong...

And Left is Right?

EXPLANATION: The view is of the right rear quadrant of the cranium, looking into the fist-sized "gaping hole" defect. The JFK face is to the top of the photo. Circle marked "A" is entry hole in right temple, viewed from inside skull. Circle marked "B" is exit hole in occipital, viewed from outside, with beveling showing direction of bullet (yellow arrow). In the dark area, enhanced and lightened at left, is a circle "C" showing a bullet hole above and to the right of the external occipital protuberance. A specimen jar in upper enhanced area seems to contain two small bullet fragments.

Above: an image posted online by Jack White. Note that in the black and white photo he claims the dark area on the left to be on the left side of the head. This makes little sense, however, in that his caption to the photo claims this area depicts a bullet hole to the right of the EOP... on the right side of the head. Was he trying to pull a fast one? Or just mistaken?

And Left is Right?

No, not at all. Unfortunately, the clognitive thinking I've described is not unique to the single-assassin theorist community. Some conspiracy theorists are so desperate to believe there was a conspiracy that they will present the wackiest statements made by witnesses decades after the shooting as some sort of "proof." These people will claim that Jean Hill's latter-day recollections are credible and that the statements of Gordon Arnold, who claimed to have been on the grassy knoll at the time of the shooting--but whose presence can not be detected in any of the photographs--is all the proof they need. One such theorist, in fact, has written me numerous times arguing that Robert Knudsen's 1978 testimony, in which he stated that he first became aware of the autopsy photos on the morning after the autopsy, did not suggest that he was not in attendance at the autopsy, as one would suspect, but suggested instead that he only took photos of the autopsy after midnight. Yet another has tried to convince me that Dallas Postal inspector Harry Holmes' report on his interview with Oswald is evidence the shots rang out while Oswald was eating his lunch on the first floor, and that Oswald was then stopped by a policeman as he left the building. This is more than a tad strange as the report specifies that Oswald "went downstairs" after "the commotion surrounding the assassination took place" and never specifies when or where he encountered the policeman in question beyond his doing so after he went downstairs, but before he left the building.

Such cloudy thinking is so widespread, unfortunately, that conspiracy theorists holding that the mystery photo was taken from the front are as likely as single-assassin theorists to dispute the obvious fact that the original description of the mystery photo (that of a photo depicting a "missile wound over entrance in posterior skull, following reflection of the scalp") indicates it was taken from behind.

In fact, as hard as it is to admit, I've been forced to conclude that many conspiracy theorists are just as "stuck" in their ways of thinking, and just as unable to see the world through a fresh pair of eyes, as the blindest single-assassin theorists. To use the image on the Clognitive Thinking slide as a metaphor, they are stuck seeing the world in shade and the middle square of this world (the Kennedy assassination) as light brown, or even orange. To continue on with this metaphor, then, single-assassin theorists see the world in light, and the middle square (the Kennedy assassination) as dark brown. Meanwhile, in the eyes of someone looking at the squares separate from any particular world view, both squares are really the same color, and a shade somewhere in the middle. (This shade, should one find it, is the truth.)

The search for the shade in the middle, moreover, alienates both those seeing the middle square as dark brown and those seeing it as light brown. I've tried to see the shade in the middle, and have upset many individuals in the process.

Here's a most telling example...

In late 2009 and early 2010, I had a number of heated exchanges on the Education Forum, an online discussion group, with Dr. James Fetzer. He kept attacking me for being closed-minded and not subscribing to his and Jack White's claims that the autopsy photos, x-rays and assassination films have all been altered by the government. He also accused me of never having read any of his books. On January 4, 2010, after I posted the Eye of the Beholder section from chapter 13 of this webpage to demonstrate that 1) I had read at least one of his books, and 2) he had never read my webpage or else he'd have known that, he responded in a changed manner. He suddenly acknowledged:

"Pat,

You have made an extraordinary discovery here, by which I am referring to the apparent second entry wound at the back of the head in the HSCA photographs, which simply stuns me. To the best of my knowledge, you are the first and only person to have made this observation...At the very least, this means that a photograph that the HSCA used to justify its shift in the entry location by four inches was actually contradicted by the lower entry location shown on the same photograph. I am fairly astonished that no one has noticed this before. I would compare it to the photo showing Arlen Specter illustrating the path of the 'magic bullet' had to have taken, while the circular patch showing the actual entry is visible well-below his hand, which means that a photo intended to illustrate the 'magic bullet' theory actually refutes it."

Well, this is it, I thought, finally an acknowledgment from Fetzer and his colleagues that I am not just a nay-sayer to their wild theories, but am actually pushing the investigation forward in new and revealing directions.

But no such luck. Three hours later, he added:

"I don't know what to say, Pat, because Jack has taken a look and says that the hole you have 'discovered' isn't there. This will take some sorting out. I will invite David Mantik, David Lifton, and John Costella to take a look, too. Something is not right."

Well, we can agree on that. Something is not right when a supposedly independent thinker such as Fetzer, who taught critical thinking at the university level, has to check with his colleagues--all of whom have embraced theories which I have publicly rejected--before allowing himself to acknowledge what he has already admitted he sees. Something is especially not right, moreover, when his admitted

reason for doing so is that Jack White, a long-time researcher who believes not only that the Kennedy autopsy photos, x-rays and assassination films are all fake, but that O.J. Simpson was innocent, no astronauts landed on the moon, no jet hit the Pentagon on 9/11, and the theory of evolution is a fraud, has told him that we are mistaken.

Or does that sound too harsh? Well, judge for yourself. Here is a February 11, 2010 post by White on the Education Forum in which he acknowledged that he perceived the election of America's first black President, Barack Obama, and America's humanitarian response to the then-recent devastating earthquake in Haiti, as all part of some master plot:

"There are not as many paid provocateurs in the JFK affair as in other more monstrous charades such as 911, Apollo, OKC, TWA800, etc. JFK was "just" the killing of a single man. Much more serious are the callous murders of thousands in other events in deceptions on an enormous scale (to say nothing of the ensuing wars).

These nitpickers have no concept of the gigantic struggle between GOOD and EVIL we are involved in. The sinister forces of the New World Order do not consider it wrong to "eliminate" the masses if it serves their corrupt agendas. The Skull and Bones elite death cult promotes death as a means toward progress. The evil international bankers, led by David Rockefeller, decide who our "leaders" will be (ala Obama). S&B and other evil groups promote EUGENICS as a means of wiping out entire populations, especially in third world nations, especially those places with abundant natural resources that can be taken over. Weaponry has been developed for weather control and creation of simulated natural disasters which can provide excuses for occupying countries in the guise of "humanitarian relief".

"Democracy" that the revolutionists brought to America will soon be gone in a world ruled by propaganda and mind control. Truth is the only lantern to shine light into the dark places and only truth can rip away the Oz curtain and expose the fraudulent wizards."

And, here is Jack's response to a January 20, 2010 post on the Education Forum in which I pointed out that his harshest critics are not the single-assassin theorists who write him off as a hopeless crackpot, but his fellow conspiracy theorists, who think that many of his claims are just too far out there to ever gain widespread acceptance:

"Your prism on things is too narrow. There ARE conspiracies. Vast conspiracies. Not "far out," as you have been led to believe. Politicians faked going to the moon. Exotic weaponry tested in Oklahoma City was then used to bring down the twin towers. The war on "terrorism" is a fake. "Presidents" past and present have been elected unconstitutionally and illegally. Agencies of the government fake evidence to suit their purposes...as far back as the JFK assassination.

It is YOU who need to learn how FAR OUT conspiracies have become. WAKE UP and smell the fakery...from Z-films to fake presidents!"

Fetzer's deference to White is particularly ironic in that his presence on the Education Forum in January 2010 was in large part fueled by his desire to push the then-recent release of Doug Horne's 5 volume set Inside the Assassination Records Review Board. The irony is that Horne has sought to distance himself from the non-JFK related statements of both Fetzer and White, and would most certainly question Fetzer's rejection of what he sees in the autopsy photo based upon what Jack White claims not to see.

From the very book Fetzer was on the Forum to promote...

"Another pet peeve I have is the false association by many in academia and the media of all JFK assassination researchers with persons who don't believe we landed on the moon six times (from 1969-1972); or with persons who believe that the 9/11 terrorist attacks were really 'controlled demolitions' set off by the government, and were not caused by fanatics flying airplanes into buildings.

I think the principal lesson of the JFK assassination is that we should not defer to arguments about major historical events (such as assassinations, and how wars begin) based on authority—we should study the primary evidence ourselves and reach our own conclusions. If people don't learn to do a better job of this in the United States, our democracy will remain in peril, and our society will continue to just 'muddle through,' rather than excel in tackling its many challenges."

FWIW, Dr. Fetzer never got back to me...

This was not true of Jack White, however...

As part of an apparently hopeless attempt to get Fetzer to see beyond White's nay-saying, I pointed out to him that the bullet wound he had admitted seeing on the back of the head photo directly overlay a wound on the skull that White had previously acknowledged. This, in turn, led White to go on the attack and falsely claim he'd never agreed with me about any such wound on the skull in the mystery photo. He then posted an image purportedly presenting his interpretation of the mystery photo.

This image was obviously in error, with the bullet hole on the back of the head enveloped in darkness, and supposedly on the left side of the head, but with a caption acknowledging it was in fact to the right of the EOP (which is at the middle of the head). I can think of no logical reason for him to use this obviously inaccurate image to refute me other than that in his rush to refute my assertion that the autopsy photos are far from fake and are in fact the key to understanding the assassination, he had lost track of what was left, and what was right.

Ironically, Fetzer was to be on the receiving end of such nonsense within weeks of the exchanges detailed above. By then, Fetzer had stopped pushing Horne's book and had instead begun pushing an upcoming book by Judyth Vary Baker, a woman claiming to have been Oswald's mistress. This upset White, who saw Baker's descriptions of Oswald as a challenge to the "two Oswald" theory he found so compelling. White thereby began attacking Baker, and presenting evidence she was a fraud. This caused Baker, through Fetzer, to challenge White's photo studies of Oswald. (These studies, published in John Armstrong's massive book "Harvey and Lee," suggested there'd been two different men using Oswald's name.) Baker then demonstrated that some of the images used by White to suggest there'd been two different Oswalds had in fact been altered to make Oswald's face look wider. White then challenged Fetzer and his ability to recognize photo alteration by presenting six photos of Fetzer, one of which he claimed was unaltered. Fetzer picked one. White then pounced and admitted that they'd all been altered, and how could Fetzer not

know this, etc... To which Fetzer responded that he'd mistakenly assumed White was not a liar, and had not been lying when he'd written that one of the images had been unaltered.

From there, things only got worse for Team Fetzer. In April 2010, John Costella published an extremely critical review of Inside the Assassination Record Review Board, and attacked Doug Horne (whom he repeatedly called "government man D.P. Horne") for theorizing that frames from the Zapruder film had been removed and painted over, when Costella had (to his mind) already proven this impossible, and had shown that the film was either "completely genuine" or "completely fabricated." Costella then concluded that "regardless of his disclaimer at the end of his last page of his five massive volumes—page 1807—that his words do not represent the views or opinions of the U.S. government, one cannot fail to feel that Horne's work is, indeed, the final chapter of the government's cover-up of the brutal assassination of the thirty-fifth President of the United States." This, of course, was wacky. Horne had self-published a work claiming that Kennedy's body had been altered, that autopsy photos had been faked, and that the Zapruder film had been altered, and yet had failed to pass Costella's smell test simply because he had failed to embrace Costella's own research.

Emboldened by Costella, Jack White then acknowledged he had his own problems with Horne, and considered Horne's book to be a "Limited hangout," a widely-over-used term for a CIA operation in which a minor crime is admitted in order to conceal a much greater crime. By embracing Horne, Fetzer had, in effect, alienated two of his closest colleagues, Costella and White.

On April 19, 2010, moreover, after White began pushing that Judyth Baker's story of a romance with Oswald was the by-product of a fertile imagination mixed with sexual frustration and a life of disappointment, Fetzer cut ties with him altogether, posting online, for all to see:

"NOTICE OF TERMINATION OF FRIENDSHIP WITH JACK WHITE, WHO HAS FINALLY DISGUSTED ME

I cannot believe that someone I have admired in the past would stoop to such a sophomoric level by lodging such a blatant ad hominem. Those who resort to arguments of this caliber have discredited themselves massively. I denounce each and every one of them...Cease and desist, Jack White. You have forfeitted being taken seriously. Please know that I want nothing more to do with you in any context at all. We are no longer friends."

Fetzer's embrace of Baker also led him to denounce David Lifton, whose work he had previously championed. Lifton had, after all, many years before, done his damndest to expose Ms. Baker as a fraud. This falling-out climaxed, sadly, when Lifton posted excerpts of Fetzer's work on 9/11 online, and called him to task for blaming the attacks, at least in part, on an international Jewish conspiracy. Now, this would be bad enough, but the ludicrous became surreal when Fetzer responded to Lifton's claims not by disassociating himself from the claims Israel was behind the attack, but by claiming Lifton's criticism of this position was motivated not by his Jewish pride, but by his desire to evade repayment of "loans" received from Fetzer years before. (After much back and forth, it turned out that these loans--more like small advances--were held by Lifton against the royalties Fetzer failed to pay him for his significant contribution to Fetzer's book *The Great Zapruder Film Hoax*, a book which Fetzer claimed had never broken even, but for which he'd supposedly never received a statement demonstrating as much from his publisher.)

The slow-motion train wreck of Team Fetzer was, one can only assume, embarrassing to all those involved. It exposed yet again the contradiction-in-terms that is the conspiracy research community. Conspiracy research demands one be suspicious, and independent-minded. People wishing to enter this world, myself included, have a deeply rooted desire to find and expose some higher truth. This leads them to feel passionate and defensive of the "truths" they uncover, a bit suspicious of those who won't accept their "truths," and a bit jealous and envious of others whose "truths" are more readily accepted by others. This leads to a lot of in-fighting, with researchers beating up on a researcher one week, and then forming an alliance with that researcher the next week or month or year to beat up on someone else.

In this particular instance--that of the scuffle between myself and team Fetzer--things came full circle on May 4, 2010. After Fetzer, in the ongoing discussion thread of Judyth Vary Baker's story she and Oswald were lovers, had once again insulted me and claimed I had no credibility due to my daring to disagree with Doug Horne and David Mantik, I responded by creating a new thread, in which I presented the section of Chapter 18 on the fragment behind the eye, in which I expose Horne's and Mantik's errors regarding said fragment. While Fetzer, to no one's surprise, failed to respond, you'll never guess who did. Actually, I suspect you will guess. That's right. Jack White. White wrote:

"Pat...a very interesting study. I am not qualified to interpret all of it.

However, I have never been satisfied with any explanation of the round 6.5 dense spot on the xray.

I particularly wondered how it could be on the back of the head, when that portion was missing, and

that it did not show in the lateral views. You may be onto something that it was to the FRONT of the skull, and LOOKED DIFFERENT FROM THE SIDE.

But my observations are not from an expert.

Thanks for the thoughtful study.

Jack"

So there you go. Fetzer had rejected my research out of loyalty to White, Costella, Lifton, Horne and Mantik. Horne had made it clear he felt no such loyalty to Fetzer and White when it came to 9/11. Costella and White later made it clear they distrusted Horne. Fetzer and White then fell out over Judyth Baker. Fetzer and Lifton then fell out over both Fetzer's attachment to Baker and Fetzer's theories regarding 9/11. White then made it clear he suspected I could be right about something on which Horne and Mantik had been wrong. Team Fetzer had thus been an illusion, and had dissolved in a puff of smoke.

Coincidence or Conspiracy?

The Mystery Photo F8: Posterior Skull

*Nipple, chest wall, and fat (from Y-incision) are seen in the distance, as viewed in stereo at the Archives—Kirschner agrees.

Line AB defines the midline of the skull—from front (A) to back (B)

Tentative EOP entry site—selected by Humes for the ARRB

Pathologist's entry site (at the EOP)—falls precisely where metal occurs on the Harper fragment, in my reconstruction

C & D are bone fragments

External beveling—per the HSCA

At left: a slide from David Mantik's 11-21-09 presentation to the JFK Lancer Conference in Dallas.

Above: the mystery photo F8, with 4 features-- (1) the triangle of scalp; (2) the jugular foramen; (3) the bullet hole and tunneling discussed in the autopsy report; and (4) the President's neck—identified.

Above: a blow-up from F8 showing the bullet hole and tunneling discussed in the autopsy report. Why would Mantik hide this from his audience?

Is it a coincidence that Mantik's most recent depiction of F8 (as seen at upper left) has text boxes obscuring the 4 features I've identified as keys to its proper orientation? Or is it by design?

Coincidence or Conspiracy?

Or had it? Through all their in-fighting, no member of Team Fetzer, numbering among them some of the most vocal and active researchers of the past few decades, had ever acknowledged I'd been right on anything regarding the medical evidence. They would say I was onto something, and then back off, as had Fetzer, or say my work was interesting but that they weren't expert enough to come to any conclusions, as had White. But no one would dare say that, by gosh, I had discovered anything. And stick to it.

I think I know why. They were afraid to disagree with Dr. David Mantik, whom Dr. Fetzer had long claimed was the number one expert on the Kennedy assassination medical evidence.

In September, 2010, while looking through Professor Fetzer's Assassination Science website, I stumbled upon Dr. Mantik's most recent power point presentation. He'd delivered this presentation--on the forgery of Kennedy's x-rays--on 11-21-09 at the JFK Lancer Conference in Dallas. Now, I was in Dallas at that time, and had intended to attend Mantik's presentation, but had arrived at the tail-end of the Q and A session afterward, just in time to hear him dismissing "Speer's Theory" regarding the "white patch" on the x-rays. At the time, I thought little of it. I mean, I can't expect everyone to agree with me.

Well, upon viewing Mantik's presentation, I came to understand why Mantik was so nervous when I spoke to him afterward. You see, not only had he dismissed my theories regarding the x-rays, as one might expect, but he'd spent much of his presentation concealing evidence supporting my theories.

Sounds pretty crazy, right? Well, if we're willing to consider that the bulk of the HSCA's Forensic Pathology Panel would misrepresent the medical evidence--if only on a subconscious level--in order to defend the credibility of their friend Russell Fisher, we should also consider the possibility that Dr. Mantik would misrepresent the evidence to defend his own credibility, and that Team Fetzer would align itself against anyone challenging their theories on the medical evidence, including yours truly.

There is evidence supporting this throughout Mantik's presentation.

First off, it must be stressed that Mantik quoted my website on one of his slides, put my name in the title of three of his slides, and actually showed several of my slides to his audience. So he is clearly familiar with my work. His being familiar with my work, then, makes it near certain that he is well familiar with my studies of the mystery photo, and my conclusion that the photo can be properly oriented through an acknowledgment of several features. So why, then, when he showed his audience the mystery photo, did he opt to bury all these features beneath boxes of text, that could just as easily have been placed to the side of the photo?

Was he concerned that those in attendance might notice these features, and argue against his orientation, which has the camera sharply to the left of the center of the skull? Was he concerned that their doing so would force them to reject his orientation, and thereby reject his conclusion the mystery photo shows a hole in the middle of the back of Kennedy's skull, where the Harper fragment used to be?

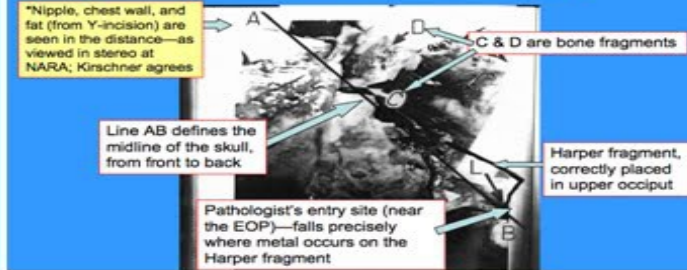

I don't know...that sounds pretty paranoid, even to a conspiracy theorist like myself. One would have to find more questionable images than this one before suspecting some deliberate deception was afoot, correct?

The Floating Debris

Mantik's Reconstruction of JFK Posterior Skull

The Mystery Photo F8

Overhead View of Human Skull

Above: a second depiction of F8 presented by Dr. Mantik during his 2009 appearance at the JFK Lancer conference. Note that the bullet hole I've identified near the EOP is once again covered by a box of text.

Above left: another slide from Dr. Mantik's presentation, depicting his theory regarding the Harper fragment's location on the skull.

At left: Dr. Mantik's depiction of Dr. Angel's theory regarding the Harper fragment's location on the skull. Note that Dr. Mantik has moved the presumed debris from a location near the temple up to the top of the head.

the Floating Debris

Correct. Unfortunately, however, Mantik provided several other questionable images, and made a number of other questionable "mistakes."

Perhaps the most egregious of these mistakes was his pulling a switcheroo on the Harper fragment. Now, to understand the relevance of this switcheroo, one must understand two things. The first is that Mantik had long ago asserted that, in his impression, the Harper fragment was dislodged from the back of Kennedy's head, and that, in his orientation, "the lead smudge" on one edge of the fragment "ended up precisely where the pathologists said the bullet had entered the rear of the skull." (This assertion, of course, failed to recognize that Dr.s Humes and Finck had consistently claimed this entrance was a through and through hole, and that even the confused Dr. Boswell, who made statements suggesting the hole was missing a piece, claimed this piece was matched up during the autopsy, which--as he was never shown or even told about the Harper fragment until many years later--rules out the Harper fragment as the source of this piece.)

The second thing one needs to know is that for many years no one from the conspiracy theorist community had challenged Mantik on his orientation of the mystery photo (F8), and his belief the Harper fragment derived from the center of the back of Kennedy's head. Some single-assassin theorists, such as Paul Seaton, had written articles challenging Mantik, but they were largely ignored by those in the CT community. Perhaps, then, Mantik had come to believe he'd really scored a bulls-eye, and that his findings had become those of the community as a whole.

And so it rested...until I came along...and challenged Mantik on both points...and pointed out that, when one accepted the impression of Dr. Lawrence Angel that the Harper fragment derived from the

top of Kennedy's head, which Mantik admitted was a possibility, the discolored edge suggesting a bullet entrance lay not on the back of Kennedy's head, but at his temple, where most conspiracy theorists assume there was an entrance. (My analysis of the fragment can be found here: <http://www.patspeer.com/harperfrag.jpg>). My "theory" if you will, was thus something equally, if not more, attractive to the conspiracy theorist community than Mantik's theory. It follows then that Mantik should have countered my theory with evidence and intelligent argument during his Lancer presentation.

But, instead, perhaps as an innocent mistake--perhaps not--he changed the location of the "metallic debris" on the Harper fragment from his orientation to Angel's. Yes, as shown on the slide above, Mantik presented the metallic debris on the discolored edge of the fragment at a point counter-clockwise from the arm-like point when showing his orientation, and clockwise from this point when showing Angel's orientation. Even worse, he cited this new and not improved location for the debris as a reason to disbelieve Angel, claiming that by placing the Harper fragment as he had, Angel "ends up with metal over here..." (Mantik then pointed to the the top of the head on the image above.) He then pounced: "How could you have metal over here in the HSCA scenario, when the bullet enters in the rear at this x-mark and exits over here." (He then pointed to the other x-mark by the temple.) He had thereby concealed from his audience that in Angel's orientation for the Harper fragment, the lead smudge suggesting an entrance was by the supposed exit on the temple. I believe this is something the audience had the right to know.

I feel terrible about this. I have great respect for Mantik's intelligence, and have found his writings on the Kennedy assassination both interesting, and informative. His review of Reclaiming History, for example, was most insightful. And yet, here, while making a presentation on his specialty, the Kennedy assassination medical evidence, a topic on which some, including Dr. Fetzer, consider him the top expert in the world, he has either made a really dumb mistake, or a deliberate obfuscation.

Unfortunately, other aspects of Mantik's presentation support this second possibility. Let's see if you agree.

Here are some examples...

Mantik started out his presentation with a quote from Jerrol Custer, the radiology technician who took Kennedy's skull x-rays. He has Custer saying that the x-rays shown him are fake. Mantik failed to tell his audience that Custer made this statement after viewing the cropped and enhanced x-rays published by the HSCA, and that, in 1997, subsequent to making this claim, Custer was shown the un-cropped and un-enhanced original x-rays by the ARRB, and had acknowledged them as the x-rays he'd taken.

Mantik then discussed the optical density of the x-rays. He'd measured this himself. He claimed that these measurements were clear proof of alteration, as some areas on the x-rays were far too white, and others far too black, and there was far more contrast on Kennedy's x-rays than on the other x-rays he'd measured. While doing so, he pointed out the problematic white and black areas to his audience... He did this, however, on photos of the computer-enhanced x-rays published by the HSCA. He failed to tell his audience that these were not the original x-rays, and that these images were computer-enhanced to increase the contrast, and that this contrast was made even greater through the reproduction of these images on paper.

Now, he knew this was deceptive. In fact, in what may go down as an irony among ironies, Mantik had previously discussed the confusion caused by looking at prints of the enhanced x-rays, and had

correctly attributed Jerrol Custer's initial failure to recognize Kennedy's x-rays to this confusion. Yes, on point 8 of his June 23, 1995 monograph *Authenticity of the JFK Autopsy X-rays*, Mantik relates "Custer has claimed that the x-rays do not look authentic. I suspect that what troubles him is the remarkable difference in contrast between the prints and the original X-rays. I know that several of us, who had repeatedly viewed only prints of these X-rays, have been somewhat surprised when first viewing these X-rays, at the lesser degree of contrast seen there."

Let's let that sink in... In 1995, Mantik suspected that Custer's confusion was related to his looking at prints of the x-rays. In 1997, sho' nuff, Custer looks at the original x-rays and says he now believes they are authentic. And then, in 2009, rather than saying "See, I was right; Custer did sign off on the X-rays once shown the originals!", Mantik ignores Custer's more recent statements and tells his audience that Custer says the X-rays are fake. And then explains to them that his own analysis supports that the x-rays have been altered. And then shows them a print of an X-ray -- the very print he'd previously claimed was the likely cause of Custer's confusion...

I mean, how is this not deceptive?

Mantik was also quite deceptive about the largest bullet fragment recovered at the autopsy. On several of his slides he pointed out a fragment in Kennedy's forehead, and claimed this was the 7 x 2 fragment recovered by Dr. Humes. He failed to tell his audience that Dr. Humes, along with just about every key player in the autopsy, had always claimed the fragment he'd recovered had come from behind Kennedy's right eye. Perhaps even worse, he failed to tell his audience that he -- Dr. Mantik -- had personally inspected what remains of the fragment removed by Humes. And had concluded that it was not the fragment in the forehead.

Now this deception fed into another. Mantik subsequently discussed my theory that the supposed 6.5 mm fragment supposedly on the back of the head was actually behind Kennedy's right eye. He told his audience that, as no expert had ever identified the fragment I'd identified as metal, this was a non-starter, and not even worth considering. He failed to consider that no true expert had signed off on his conclusions, either. Even worse, he presented my findings as those of a layman who'd thought he'd seen something on an x-ray; he failed to tell his audience that the location of the fragment I'd identified--behind Kennedy's right eye--was exactly where those present at the autopsy had claimed to have found a 7 x 2 fragment.

Now this was information which I firmly believe they should have been told...particularly in that the two radiology technicians who'd actually taken Kennedy's x-rays both said they saw a fragment in this location when shown the x-rays by the ARRB. That's right. They said they saw a fragment...just above or in the orbital ridge...where I've proposed there is a fragment...only years before I'd ever noticed such a fragment.

And yet Mantik failed to tell this to his audience. And let them think instead that little old under-qualified me was simply seeing things...

Well, if I wasn't then, I was almost a year later when I finally saw his presentation. I was seeing red. I'd looked up to Mantik. Although I'd disagreed with many of his findings, I'd hoped he and I could work together on something that would reach beyond the research community. I'd believed he was sincere. I'd never considered that he would go to Dallas to counter some of my arguments and conceal so much from his audience. I'd never considered that, in order to convince his audience they should ignore my ramblings, that he would lie. That's right, I wrote "lie."

Beyond his misrepresenting the location of the gray smudge on Angel's orientation of the Harper fragment, there is reason to suspect that Mantik lied--meaning "deliberately deceived" as opposed to "misled his audience" or "failed to tell his audience pertinent information"--at least one other time during his presentation. And this was when he was discussing the white patch visible on the lateral x-rays. To counter my theory that the "white patch" he'd identified on the x-rays was nothing more than the wing of bone seen on the autopsy photos overlapping intact bone at the back of Kennedy's skull, Mantik claimed, on a slide entitled "The White Patch--Impossible to Explain via Overlapping Bone" that "a single layer of bone contributes only a modest amount to the OD" (optical density measurements) -- "an amount far too small to explain the white patch." Well, okay, he's sticking to his original story here. Nothing wrong in that. I mean, he's never tested x-rays created on the equipment used to make Kennedy's x-rays, at various settings, let alone those involving overlapping bone. And he's never explained why, if the loss of a layer of bone should have so little effect on the appearance of the skull on the x-ray, that the fractures in Kennedy's skull, which Mantik accepts as legitimate fractures, and which would have involved only one layer of bone, were so easily recognizable. But the man's entitled to his beliefs.

But he didn't stop there. No, in the notes accompanying his presentation on Dr. Fetzer's website, Mantik goes on to say "note that the dark area contains two layers of skull bone, one from each side, yet this area is astonishingly dark. One more layer of bone will not turn the Dark Area into a white patch." Well, this is total nonsense. My "overlapping bone" theory, if you will, does not hold that the white patch has three layers of bone, and the dark area two, and that the white patch therefore represents 50% more bone, it holds that the white patch has three layers of bone, and the dark area one, and that the white patch therefore represents 300% as much bone. This is a huge difference. One that Mantik should not have missed. I mean, where does he think this overlapping bone came from? Could he really have read my writings on the "white patch" and "dark area" and missed that I was claiming that the bone missing from the dark area was the bone overlapping the skull on the white patch? I just can't see how...

And that's not the worst of it. In the latter part of Mantik's presentation he discussed the conclusions of the three consultants hired by the ARRB. (He skipped over some of these slides in Dallas, presumably because he was short on time, but they appear to be the same slides as those on Fetzer's website.) Now, it's important to note that, prior to Mantik's presentation in Dallas, no one in the audience had ever read the memoranda in which the conclusions of these consultants were reported, as the reports of their conclusions were not made public until a month later, with the release of Doug Horne's book *Inside the ARRB*. And so, Mantik had pretty much a blank slate--he could have told his audience that these guys had agreed that he was right about everything.

It is to Mantik's credit, then, that, on his slide discussing the findings of Dr. John Fitzpatrick, a Forensic Radiologist, he noted, among eight other points of interest, that Dr. Fitzpatrick claimed he did not find the work of Dr. Mantik "persuasive." Now, on Fetzer's website, Mantik admits this is troublesome, and that he is annoyed that Fitzpatrick wouldn't respond to his letters and explain his failure to be persuaded.

But what Mantik should have known, and should have told his audience, was that Fitzpatrick's reasons for rejecting his conclusions regarding the "white patch" and "dark area" were readily apparent, once one read the entirety of Horne's report on Fitzpatrick.

You see, Fitzpatrick shared MY interpretation of the "white patch" and "dark area." While Mantik had spent the first part of his presentation dismissing my findings as those of a layman, and had spent the

last part of his presentation discussing the findings of the ARRB's experts, and even claiming "The Buck Stops with Fitzpatrick" when he found something upon which he and Fitzpatrick had agreed, he failed to tell his audience that, when discussing the lateral skull x-rays with Horne, Fitzpatrick had claimed that "some of the dark appearance in the anterior portion of the skull is due to missing bone..." This is PRECISELY as I've claimed, and in opposition to Mantik's own claim that "the dark area contains two layers of skull bone, one from each side."

And that's just the half of it. Mantik also failed to reveal that Fitzpatrick claimed "Overlapping bone is clearly present in the lateral skull x-rays," and that, drum roll please, "the red flap above the ear" in the autopsy photos "equates with the overlapping bone in the lateral skull x-rays."

That's right. While Mantik had told his audience that the "buck stops with Fitzpatrick" when Fitzpatrick had agreed with him, he had completely concealed from his audience that Fitzpatrick had subscribed to the "overlapping bone" theory to which I subscribe, which explains both the "dark area" and "white patch." What Mantik had snidely dismissed as "Speer's theory" before his audience, had been in fact "Fitzpatrick's theory" years before. And Mantik had chosen not to tell this to his audience.

And Fitzpatrick wasn't the only expert whose findings he concealed. While Mantik noted, on his slide describing the findings of Dr. Douglas Ubelaker, a forensic anthropologist consulted by the ARRB, that Ubelaker found the "dark area" on the lateral x-rays "very puzzling," he left out that this led Dr. Ubelaker to wonder, not if the x-rays had been altered, as Mantik presumes, but "whether there had been some processing defect when the x-rays were developed." He also failed to reveal that Ubelaker had noted "overlapping bone fragments" in "the temporal-parietal region of the lateral x-rays," which we can only assume was yet another reference to the "white patch."

Now, should I give Mantik the benefit of the doubt on this, and assume he'd found these statements by Fitzpatrick and Ubelaker unimportant? Probably not. Not after so many other suspicious "mistakes."

Well, then what should I do? Should I just let it slide?

Probably not. Not after he went after me in a public forum, knowing full well that my theories were supported by those with better credentials than himself--men whose expertise he'd trumpeted elsewhere in his presentation--and had kept this from his audience. I mean, if Dale Myers or John McAdams, in the middle of a presentation, had made a similar series of mistakes and/or evasions in order to dismiss my theories, I'd assume their misrepresentations and evasions were by design, and call them out on it.

And so, while I'd learned some time ago to accept the possibility single-assassin theorists are just as honest as conspiracy theorists, I've been forced of late to accept the related possibility conspiracy theorists are just as dishonest as single-assassin theorists.

I'm still struggling with this information...

It's just hard for me to accept that Mantik could be so deceptive...on purpose. Perhaps Mantik, like so many others, has a blind spot, or two, or three. People--even those who in their minds are fully committed to learning the truth--settle into certain ways of thinking--and this groove, or rut, leads them to dismiss other ways of thinking--without ever seriously considering what it is they are dismissing.

But would this blind spot lead Mantik to misrepresent the location of the metallic debris on Angel's orientation of the Harper fragment? And misrepresent my theory (that was really Fitzpatrick's theory)

regarding the "white patch"? I don't know.

Perhaps then--and this may be the most disturbing thought I've had in relation to the assassination--those pushing theories (of any breed) are often blind not only to the possibility someone else could be correct, but to the possibility they could be wrong. Perhaps then, in some people, when their theories are challenged to such a degree that they feel they are under attack, some sort of self-defense mechanism pops up that allows them to twist and reconfigure the facts, so they can avoid what to them would be a form of death--an acknowledgment that their pet theory is not house-broken. Perhaps then I should give Mantik a break, and assume he was so bent on defending his position that he began presenting what he wanted to be true as the truth, and subconsciously protected himself from anything that would suggest that he'd been wrong.

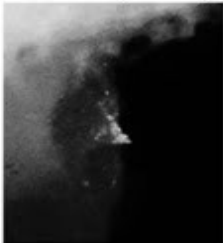

It is clear, however, that if I'm to let Mantik off the hook for his deceptive presentation, then I should be equally forgiving of Dr. Lattimer for his deceptive presentation of the single bullet theory, and equally forgiving of Dale Myers' for his deceptive animation, and equally forgiving of John McAdams for his continued defense of the deceptive Artwohl exhibit, and equally forgiving of Vincent Bugliosi for completely distorting the historical record while claiming to defend the historical record. And I find this really hard to do.

Of A, B, C's and X-Rays

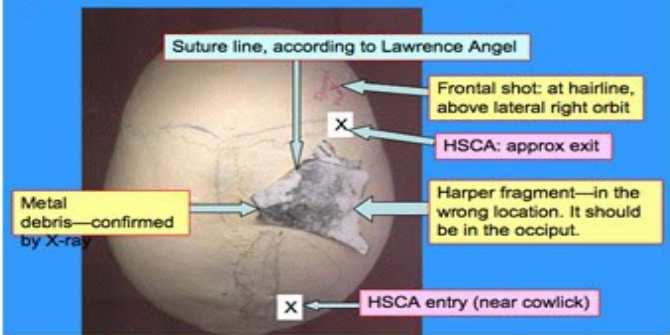

COMPUTER SCAN OF THE ORIGINAL X-RAY MADE BY JOHN HUNT AT NARA II

At left and below: an image from Dr. Mantik's 2011 CTKA article, showing metal debris on an x-ray of the Harper fragment.

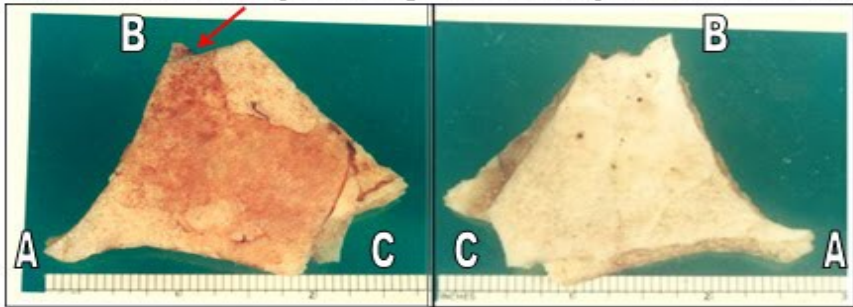

At right: a slide from Dr. Mantik's 2009 JFK Lancer Presentation.

Overhead View of Human Skull

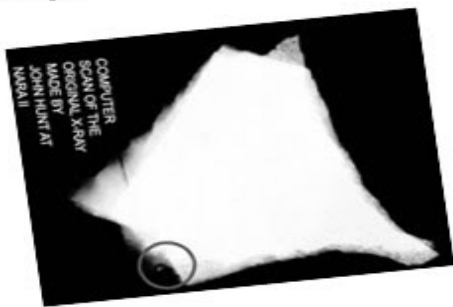

Suture line, according to Lawrence Angel
Frontal shot: at hairline, above lateral right orbit
HSCA: approx exit
Harper fragment--in the wrong location. It should be in the occiput.
Metal debris--confirmed by X-ray
HSCA entry (near cowlick)

As shown at right above:, in 2009 Dr. Mantik claimed that, in Dr. Angels orientation for the Harper fragment, the metal debris shown on the x-ray of the fragment is at the top of the skull, and not by the temple.

He confirmed this in 2011, on the image at left above. But he is clearly in error. As shown above, when one identifies the fragment's corners as A, B, and C, it's clear Mantik has placed the debris at point B, when it was really at point C.

COMPUTER SCAN OF THE ORIGINAL X-RAY MADE BY JOHN HUNT AT NARA I

For some reason, the image above sometimes fails to show. Here is a link: [Of ABC's and X-Rays](#)

Of A, B, C's and X-Rays

But I'm trying. In 2011, I had a number of heated arguments with Dr. Fetzer in which he revealed himself to be even less rational than I'd previously suspected. At one point, in order to refute my questioning of his friend Dr. Robert Livingston's credibility, he claimed the transcript of Dr. Robert Livingston's testimony in Dr. Charles Crenshaw's civil case had been falsified...

This was truly wacky. Livingston had testified...at Fetzer's urging. Bradley Kizza, Crenshaw's attorney--and the one presumably responsible for the accuracy of the transcript--was a friend of Fetzer's. The transcript, even worse, was made a public document by the ARRB, almost certainly at the urging of another of Fetzer's buddies, Doug Horne.

So what was Fetzer talking about? Apparently, when faced with evidence that his friend, Robert Livingston, was at best a weird egg, and not entirely credible, he opted to claim the evidence was fake. EVEN THOUGH the evidence was evidence he--Jim Fetzer--had brought before the public. (Dr. Livingston had testified that he'd come forward--with his highly dubious story he'd spoken to Dr. Humes on 11-22-63--in order to *"save the world."*)

In any event, shortly after this battle with Fetzer, (a battle in which David Lifton came down on my side, by the way), Dr. Mantik finally responded to my criticisms of his 2009 Lancer presentation...and totally embarrassed himself.

Yep, in a June 2011 response to my website published on the CTKA website (which, by the way, refused to allow a rebuttal), Mantik not only defended his many mistakes, he actually doubled down. While he admitted that I was correct on one key point--that in his 2009 Lancer presentation he'd presented the metal debris "at the opposite pole on the Harper fragment" from where he'd originally placed it, he maintained that he had done so not to refute Dr. Angel's interpretation of the Harper fragment, but because "new evidence on the Harper x-ray. discovered by John Hunt" convinced him the debris was really in this new location. As Mantik admitted merely that he'd left his audience with a "confused picture" of the site of the lead debris, and not that he'd thoroughly misled them, I at first thought this was mere obfuscation. That the "new site for metal" discovered by Hunt was in fact unveiled in Mantik's presence at a conference six years before the Lancer conference, and that he'd failed to admit that he'd continued to cite the old location of the debris as strong support for his own interpretation of the Harper fragment in the intervening years--and had even done so in the first part of his Lancer presentation-- only confirmed this suspicion.

While subsequently reading his April 2011 review of Don Thomas' book *Hear No Evil*, however, I came to realize that he really HAD changed his interpretation of the debris' location. Yes, in his review of *Hear No Evil*, Mantik not only admitted he'd been incorrect in placing the debris at its former location, he actually put a red arrow on an image of the Harper fragment purporting to point out the real location for the debris, and put this in the WRONG location. No, scratch that...the obviously wrong location. No, scratch that...the blatantly obvious 100% clear to anyone using their brain WRONG location. (This is demonstrated on the slide above.)

Needless to say, this raises some troubling questions. Just as I'd once felt McAdams could not honestly believe some of the bizarre stuff he'd claimed, it's hard for me to believe someone with a background in radiology, as Mantik, could possibly believe the metal debris on the x-ray is where he claims it to have been on the photograph. Pure fantasy. Alice-in-Wonderland kind of stuff.

And yet, he seems to actually believe this nonsense. While many of the claims in Mantik's response to

my criticisms smelled to high heaven--he claimed, for instance, that he always presented the HSCA's contrast-enhanced x-rays in his articles while discussing what he claimed was an inordinate amount of contrast in the originals not because he was trying to deceive his readers, but because the available photographs of the contrast-enhanced x-rays looked more like the originals than the available photos of the originals--he made a number of surprising claims in his review of Don Thomas' book that led me to suspect he was not playing to any audience but himself. I mean, as a conspiracy theorist, I know full well there is NO upside in questioning if a bullet fired at Kennedy from the grassy knoll would leave a trail of fragments near the top of his skull and exit the occipital region. And yet, from answering these questions, Mantik not only concluded more than one shot struck JFK's skull but that "The GK shot, if any, missed." I mean, that's pretty much suicide in some circles. I wonder how his buddy Fetzer feels about that one.

Mantik's unpredictability and willingness to go against the grain, then, leads me to suspect he is NOT a liar, just grossly mistaken at times and blinded--truly blinded--by his belief in himself and his research. I can only hope I'm not equally blind.

It follows, then, that the bizarre and often looney claims of Dale Myers, John McAdams, et al, may be equally innocent.

There is a key difference, however, between the fighting among conspiracy theorists like Mantik and myself, and the fighting among conspiracy theorists and single-assassin theorists. Men such as Mantik, Fetzer and White do not have a support team, so to speak, in the mainstream media, and they aren't taken seriously by historians. Men such as John McAdams and Dale Myers, on the other hand, are taken seriously, even though their research may be as wild in its way as the research of the wildest CT.

This brings us back to a question raised in the last chapter--why so many supposedly rational people in the media embrace the work of irrational theorists.

$2 + 2 = 3$

Well, no, it doesn't. Or does it? The thought occurs that much of the disconnect between the thinking of the vast majority of the public, and that of mainstream journalists and historians, comes not from what information they've been exposed to, but from how they process that information.

To put this in mathematical terms...it seems quite clear to me that most Americans, for better or worse, look at the assassination of President Kennedy with the expectation things add up. They look at the evidence Oswald killed Kennedy, and see that this evidence amounts to, let's say, 1.7 out of a possible 2. They then look at the evidence Oswald acted alone, and see this, let's say, as a 1.6 of a possible 2. They then add these numbers together and get 3.3, which is NOT 4. They therefore suspect a conspiracy.

Now contrast this with the thinking of most mainstream journalists and historians. They look at the evidence Oswald killed Kennedy, and score this as a 1.7 out of a possible 2. They then look at the evidence he acted alone, and see this as a 1.6. Now, these were the same numbers provided by most Americans. And yet they come to a totally different conclusion.

Here's why: they round up. Yep, it seems clear to me that PROFESSIONAL journalists and PROFESSIONAL historians have it in their heads that, since the truth is either 1 or 2, they can't

conclude 1.7 or 1.6. They feel they have to pick. So they round up. So 1.7 becomes 2, and 1.6 becomes 2, and $1.7 + 1.6 = 4$, and the muddy case suggesting Oswald's sole guilt becomes the presumed truth until proven otherwise.

It seems likely, moreover, that many members of the media dismissing the possibility of conspiracy do so for personal reasons. Members of the media who left the story behind to tell other stories, for example, can take solace that they didn't miss out on the biggest story of the century. They can get on the ride at Disneyland and sing "It's an Oswald, after all" between refrains of Beethoven's "Hallelujah!" chorus, and not look back with discomfort. Similarly, mainstream historians, who take tremendous pride in their status as "professionals" and "recognized experts", can take comfort that the wacky amateur sleuths and wanna-be "Quincys" of the conspiracy research community, were wrong. The single-assassin theory promotes the belief that the government's experts were right, after all, and that we should, therefore, have more faith in "experts," including, by extension, professional historians. While this is dime store psychology at a discount, I have little doubt this is a factor in the widespread acceptance of the works of Posner and Bugliosi, et al, by those who should have known better.

Should this proposal sound ludicrous, and should one assume the competitive nature of the mainstream press would have led to the discovery of any hidden truths about the Kennedy assassination, should any truths be hidden, one should consider the wise words of Walter Lippman, one of the most respected journalists of the twentieth century. In 1920, in a detailed study published in the New Republic, Lippman argued that the New York Times, and by extension all the mainstream press, was biased in its coverage of the Russian Revolution. He reported that articles on the Revolution written by American journalists were *"dominated by the hopes of the men who composed the news organization"* and had inaccurately reported 91 times that the revolution was on the verge of collapse, while citing events that never happened, and atrocities that never took place. He summarized that *"In the large, the news about Russia is a case of seeing not what was, but what men wished to see"* and that, in their pushing what they wanted to see on the public, these men were guilty of a *"boundless credulity, an untiring readiness to be gulled, and on many occasions a downright lack of common sense."*

One can only assume then that the failure of the mainstream press to accurately report Kennedy's death was no surprise to Lippman. In fact, although Lippmann, in the days after the assassination, voiced his support for President Johnson, and later voiced his support for the Warren Commission's conclusion Oswald acted alone, he later told his biographer Ronald Steel that he had never ruled out a conspiracy.

And he may not have been the only journalism icon to privately harbor such doubts... There is an intriguing passage in A.M Sperber's 1986 best seller *Murrow: His Life and Times* that leads me to suspect legendary newsman Edward R. Murrow shared Lippman's concerns. Sperber relates that when Murrow, who was at that time working for Kennedy as head of the U.S. Information Agency, first heard Kennedy was wounded, he tried to reassure his wife, but that *"When the word from Dallas changed to assassinated, he grew silent and wondered about Johnson."* *Wondered about Johnson*, not worried about Johnson... My, what an interesting choice of words! In any event, Sperber then relates that Murrow, who was seriously ill at the time, almost immediately lobbied congress for more money so that his agency could *"explain to the rest of the world that the government of the United States would continue,"* and further convince them that the assassination *"was not the beginning of World War III."* He then relates that LBJ's style had long-grated *"on Murrow like a fingernail run across a blackboard,"* and that Murrow resigned from his position--and not because of his health, although it may have been a factor--on December 19, 1963, less than a month after Johnson assumed office.

Chapter 20: Conclusions and Confusions

A New Perspective on the Shots that Killed the President

Above: a comparison of a frame from the Secret Service re-enactment film of 12-5-63 (at left) and Warren Commission Exhibit CE 891 (at right). CE 891 was taken during the 5-24-64 re-enactment of the assassination for the Warren Commission, and corresponds to frame 186 of the Zapruder film. This comparison shows that the oak tree believed to have blocked any shot from the sniper's nest between frames 167 and 210 was a bit more sparse at the time of the shooting than it was the next May, and that, accordingly, someone might have attempted a shot at this time. The blue arrow in the Secret Service film points to the head of JFK's stand-in.

A New Perspective on the Shots That Killed The President

Shot #1. Approximate firing time: Zapruder frame 188.

Hit Kennedy in back around 190, fell out in limousine. (Possibly a hand-loaded bullet.)

From: the sixth floor window of the TSBD.

Heard by: pretty much everyone in Dealey Plaza between the time of the shot and 10 frames afterward.

Other evidence for: the wound in Kennedy's back, probed at autopsy and found to have been a shallow wound with no passage into Kennedy's chest cavity. CE 399, the nearly pristine bullet found on a gurney in Parkland hospital, the appearance of which would be consistent with the bullet's having been hand-loaded and under-charged (which would, in turn, be consistent with this bullet's having created the shallow back wound observed at autopsy). CE 543, one of the rifle cartridge cases found in the depository, which ballistics investigator Joseph Nichol believed may have been used prior to the assassination, which, it follows, may have been the hand-loaded cartridge firing CE 399. Hugh Betzner's photograph taken just before the first shot, determined to have been taken at Z-186. Jackie Kennedy's turning to her husband beginning at Zapruder frame 190. Phil Willis' testimony that Mrs. Kennedy snapped her head in that direction at the sound of the first shot. Secret Service Agent George Hickey's turning to his right starting around frame 193. Kennedy's jerky head and hand movements beginning around Zapruder frame 194. Rosemary Willis's turning to her right around frame 198. Phil Willis' photograph taken as a reaction to the first shot, determined to have been taken at frame 202. Secret Service Agent John Ready's turning to his right around Zapruder frame 203. President Kennedy's lowering his right arm and lifting his left before frame 224. Connally's testimony that he believed the first and second shot were fired very close together and indicative of automatic rifle fire. The testimony and statements of numerous witnesses indicating that the first shot rang out when Kennedy was waving or as the limousine approached the Thornton Freeway sign.

Jiggle analysis: Zapruder's camera jiggles at 194.

Shot or shots #2. Approximate firing time: Zapruder frame 222.

Hit Kennedy in hairline at frame 224, exited his throat. Connally wounded in his chest, wrist, and thigh. Wounds seem instantaneous, but it seems likely they were created by separate bullets rapid-fired from a semi-automatic weapon.

From: most likely the upper floors or roof of the Dal-Tex Building.

Heard by: a few near Houston and Elm, perhaps a few on the railroad bridge. Bullet and/or bullets were either fired from a rifle equipped with a silencer, or fired from deep within a building so its sound was muffled in comparison to the other shots. Subsonic ammunition may also have been involved. It's noted that Nellie Connally, both in her book and in her testimony, says "and then--a second shot" or "and then there was a second shot;" and that she rarely mentions *hearing* this second shot. In fact, she didn't mention hearing this second shot until 1966, when she said as much to Life Magazine. Since she also swore she saw her husband get hit by this shot and that it came after he yelled "No, no, no," and since her husband's testimony and the Zapruder film demonstrate she didn't even look at him till frame 230 and he didn't yell anything until after he'd already been hit, it's safe to say she might have been confused. Neither her husband, for that matter, nor Mrs. Kennedy, recalled hearing a shot between the first shot which hit the President, and the last, which killed him. As a result it seems possible that, due to her proximity, Mrs. Connally simply heard this shot *strike* the President and/or her husband, and registered it as a shot, without noting that it was not as loud as the first shot.

Other evidence for: the small entrance wound in Kennedy's hairline, and the small wound in Kennedy's throat. CE 903, the re-enactment photo created by Arlen Specter for the Warren Commission, supposedly demonstrating the viability of the single-bullet theory, but really showing how a bullet just missing Kennedy's right shoulder might proceed to hit Connally in the back. Connally's back wound, which, according to Connally's doctors, suggested that the bullet striking Connally had not previously struck Kennedy. Connally's wrist wound, which, according to Connally's doctor, Dr. Charles Gregory, was inconsistent with a wound created by the nearly pristine bullet supposedly creating this wound, Exhibit CE 399, unless this bullet was traveling backwards. The traces of copper found on the front of Connally's clothing, which suggests that the jacket of the bullet striking Connally had been disrupted even prior to striking his wrist. The movement of Connally's jacket forwards which briefly obscures his shirt from view in the Zapruder film. The rapid lifting of Kennedy's hands towards his throat as seen in frames 226 and 227. (His hands were actually dropping towards his chest between 224 and 225, but they shot sharply upward at 226.) Connally's hair jumping up and his being straightened out in his seat, only to collapse back to his right around 234. Bullet fragments removed from Connally's wrist that do not match the bullet found on the gurney nor the fragments found in the President's skull. (Actual bullet or bullets may have bounced out of the car off Connally's leg, or been picked up by a Secret Service Agent. There were rumors that a hole in the floor of the limousine was discovered in early 1964, which might account for the bullet leaving Kennedy's neck should it have been a separate bullet.)

Jiggle analysis: Zapruder's camera jiggles around 227 and again at 231.

Shot #3. Approximate firing time: Zapruder frame 310-311.

Hit Kennedy near the temple at frame 313. Bullet fragmented. One piece of its core seems to have continued on to chip the concrete near Tague around 319.

From: the sixth floor window of the TSBD

Heard by: everyone in Dealey Plaza from the time of the shot up to 10 frames afterward. Tague would have heard this shot around 319 or 320.

Other evidence for: extensive damage to the head of the President. Explosion of skull as visible in the Zapruder film. Bullet fragments found in the President's brain. Additional fragments believed to be linked to these fragments found underneath Nellie Connally's seat as well as on the front seat of the limousine. Front seat fragments linked to rifle found on the sixth floor of the TSBD.

Jiggle analysis: Zapruder's camera jiggles around 318 and 324 and again at 331.

Sound or Shot #4. Approximate firing time: Zapruder frame 320-327.

Missed or possibly not even a shot. Quite possibly a loud firecracker used as a diversionary device. Combat Lessons #6, a 1944 publication of the U.S. Army, noted that, in both the Pacific and European theaters of World War II, *"enemy troops have used firecrackers for diversionary purposes, especially when trying to deceive our troops as to the positions of snipers."* Combat Lessons #4, from 1942, notes as well that German snipers used slow-burning fuses so that no one would be near the firecrackers when they exploded. This tactic, which single-assassin theorist Mike Williams assures me is still in use today, was therefore not only known to snipers in 1963, but was one likely to be used, should there have been multiple shooters in buildings requiring minutes to escape.

From: somewhere west of the Texas School Book Depository, possibly the railroad yards, but more

probably the back of the arcade north of the grassy knoll, or the parking lot across the street. William Newman, and Abraham Zapruder, both facing the President, with the picket fence on their right and school book depository on their left, nevertheless felt the last shot came from behind them. Since a loud sound coming from behind them at this time would arrive but a split second after the sound of a third shot fired from the depository building, a sound's coming from this area would be likely to confuse Newman and Zapruder, and other witnesses nearby, and lead them to recall hearing but two shots. Sure enough, Newman, Zapruder, Mrs. Kennedy, Bobby Hargis, Clint Hill, and Paul Landis, could clearly recall but two shots, and those nearby Kennedy claiming they heard three shots mostly did so while claiming the last two shots were nearly simultaneous. A diversionary device set off in this location would, of course, draw attention from the buildings behind the President when he was shot. If this was the plan, of course...it worked. In the immediate aftermath of the shooting, the bulk of the Police and eyewitnesses looking for the shooter ran towards the grassy knoll and railroad yards, and ignored the buildings behind the motorcade.

Heard by: everyone in Dealey Plaza from the time of the explosion to 10 frames afterward. Due to their proximity, many interpreted this shot or sound as being the same shot as shot #3. Tague would have heard this explosion around 331-334, which might explain why he was initially convinced he was hit *before* the third shot.

Other evidence for: reports of smoke near the stockade fence. There were gusts of wind up to twenty miles an hour which may have blown the smoke in that direction. The statements of Dallas officer Joe Marshall Smith, who thought he smelled gunpowder in the parking lot west of the School Book Depository.

Jiggle analysis: camera jiggles at 324 and again at 331.

The testimony of virtually every witness in Dealey Plaza can be accommodated through this simple four shot (or sound) scenario. It doesn't rely on the hard-to-believe single bullet theory of an undamaged bullet nor on the widespread but scarcely supported by the evidence theory of a shooter-at-the-stockade fence. Its main drawback, as far as testimony goes, is that it calls for 4 shots (or sounds) when most witnesses heard only three. This can be effectively overcome through the argument that the second shot was silenced and heard by only a few. This scenario also fails to account for three shots in the TSBD, where three shells were found. While this could be explained by the sniper's dropping an extra shell or by the Dallas Police Department planting a shell, the thought occurs that there was seemingly an extra shell at the Tippit killing as well, where the 4 recovered casings didn't match the 4 bullets removed from Tippit. This uncomfortable development led the Warren Commission to conclude that in fact 5 bullets were fired at Tippit, even though most witnesses heard only three shots.

Should this come as a surprise, here is a breakdown of these witnesses... Mrs. Barbara Davis (3H343) and Mrs. Charlie Virginia Davis (6H456) heard two shots. Helen Markham (3H308), Domingo Benavides (6H447), and Sam Guinyard (7H396) heard three shots. William Scoggins (3H325) and L.J. Lewis (20H534) heard "three or four." Warren Reynolds (11H435) heard "four or five or six." And Ted Callaway (3H352) heard five.

The statements of these witnesses, in fact, prove most helpful. As there were at least four shots fired at Tippit, and most witnesses thought there could have been three or less, they suggest that, should there have been a fourth shot fired at Kennedy, as I've proposed, the witnesses to that shooting might not have remembered hearing it, even if it wasn't silenced or suppressed in some manner. At the same time, moreover, the statements of these witnesses support the possibility that one of the shells found at the Tippit shooting location had not been fired that day. Well, this, in turn, suggests the possibility that one of the shells found in the depository had not been fired that day. While one can only speculate as to why this would be, perhaps, just perhaps, Oswald had kept an empty shell in the chambers of his

weapons, perhaps as protection for his children or perhaps as protection for himself should his wife Marina get a hold of his weapons during one of their frequent domestic squabbles. It is worth noting here that the shell of the bullet fired at General Walker was never located. If Oswald had left it in the chamber of his rifle, this could very well explain the third shell found in the sniper's nest.

Supporting this speculation is the testimony of the three men on the floor directly beneath Oswald. The testimony of all three supports that there was no first shot miss, and that the last two shots came right after another. Harold Norman's statements, so often used to prove that Oswald was the lone assassin, not only reflected that Kennedy was hit by the first shot, but that only two shells dropped to the floor in the firing sequence.

The View From Afar

At left: frame 224 of the Zapruder film, the presumed moment of impact for the bullet striking Governor Connally. Could a single burst of automatic gunfire at this moment strike Kennedy in the back of the head, and Governor Connally in his armpit and wrist?

It appears so. Warren Commission Exhibit 892, at right, correlates to Zapruder frame 207, when a bullet fired from the sniper's nest would be descending 24-25 degrees.

This approximates the angle of descent from the roof of the Dal-Tex Building circa frame 224. Of course the Dal-Tex Building was almost directly behind the limo at frame 224.

Warren Commission Exhibit 901, at left, correlates to frame 255 of the Zapruder film, and shows the approximate horizontal alignment of Kennedy and Connally from the Dal-Tex Building at frame 224.

As one can see by studying Exhibits 892 and 901, a burst of gunfire from the Dal-Tex roof might very well have hit Kennedy in the back of the head, and Connally in the armpit. They were in fact just inches apart.

The View From Afar

To be clear, the scenario listed above is not "my theory". It is a possibility more in line with the evidence as I see it than any of the scenarios offered by the government, and any of the scenarios as yet offered by the research community, that is all. I will change it as I learn more, and better understand the evidence, or as elements of my research are proven incorrect.

There are, in fact, aspects of the scenario with which I am uncomfortable. I'm not sure if a small-caliber

subsonic bullet could do the damage to Kennedy or Connally I've proposed. For a long time, I was also unsure if Kennedy and Connally would be properly aligned for a burst of shots from the roof of the Dal-Tex Building circa frame 224 of the Zapruder film.

In 2009, I finally realized I could use the Warren Commission's re-enactment photos to answer this last question. Since a bullet fired from the roof of the Dal-Tex would be descending at 24-25 degrees, I looked at the relationship between Kennedy and Connally at frame 207 of the Zapruder film, when a bullet fired from the sniper's nest window would be descending 24-25 degrees. Sure enough, Warren Commission Exhibit 892 recreating frame 207 shows that the entrance wound on the back of Kennedy's head would have been at around the same level as the wound in Connally's armpit. (Although the Kennedy stand-in in this exhibit was sitting almost a foot further from the ground than Kennedy was sitting on 11-22-63, and although there were differences in the height of the Connally stand-in and Connally, and the relative positions of the seats in the Presidential limousine and the limousine used in the re-enactment, SS Agent Thomas Kelley testified before the Warren Commission that "There was an adjustment made so that...the stand-in for Governor Connally would be in relatively the same position" as Connally was to Kennedy. One hopes they got it right.)

But what about the right-left relationship of Kennedy and Connally? Well, since the proposed sniper on the Dal-Tex roof was firing from almost directly behind the limo, I decided to look at Warren Commission Exhibit 901, a re-enactment photo taken from almost directly behind the limo. Well, in opposition to most current re-enactments, this showed Connally to have been sitting slightly to the right of Kennedy in the limo... When one moves Connally back over a few inches, and turns him further to his right, however, one finds that his armpit is now just right of Kennedy's head. This proved that, from the perspective of the roof of the Dal-Tex Building circa frame 224 of the Zapruder film, the entrance wound low on Kennedy's head and the entrance wound in Connally's armpit were but inches apart, well within the spread of bullets rapid-fired from a semi-automatic weapon.

So maybe I'm onto something... Either that or I've stumbled on yet another coincidence.

The Truth About Lying

Unfortunately, the most clear-cut conclusion I've come to regarding the assassination is that many of those tasked with conducting the investigation of Kennedy's murder LIED. But that's not where it ends. I've also come to conclude that many of the most prominent critics have told similar lies, and that maybe, just maybe, the truth about lying is not only that it is ever-present, but indistinguishable to us at times from telling the truth. Yep, it now seems clear to me that, in the heat of argument, it's quite normal, expected even, that those preparing to attack or respond to an attack gather bits and pieces of what they remember and reconstruct them in the manner most supportive of their position. It seems clear, moreover, that they do this subconsciously.

Let's use Senator Arlen Specter as an example. In 1992, as a response to the criticisms of the Warren Report at the center of the movie JFK, he wrote a letter to the Philadelphia Inquirer. This, in effect, was a man accused of being a liar writing a letter arguing that he is not a liar. And yet the letter was filled with half-truths, deceptions and lies. Here is the letter in question (with my comments in **bold**):

'Jfk' The Film Mangles The Facts The Single-bullet Theory Has Withstood The Test Of Time.

January 05, 1992|By ARLEN SPECTER

When I was first asked about the new movie JFK by the news media in early December, I tossed it off with a laugh, saying that I would try to see it during the holiday season because I enjoyed fiction.

When I saw it a few weeks later, I thought that it was anything but funny, because it portrayed to about half of America (those under 12 when President John F. Kennedy was murdered 28 years ago) a false story as a matter of first impression in a docudrama format that intermixes authentic black and white newsreels with black and white fictional clips so that the viewer cannot tell which is which in an otherwise color film.

The strength of our democratic institutions resides in the unabridged freedom of citizens to criticize their government. That right to criticize was eloquently articulated by Thomas Jefferson: "Were it left to me to decide whether we should have a government without newspapers, or newspapers without a government, I should not hesitate a moment to prefer the latter."

Our government at all levels has lots of problems, and no one ever said it better than Winston Churchill: "Democracy is the worst form of government except all those other forms that have been tried from time to time." Government has an absolute duty not to lie to its people. There is at least some duty on the part of the critics, especially those using the technique of a movie docudrama, not to fraudulently and intentionally deceive a whole generation of Americans about an important historical event.

(Yes, you read that right...Specter, who'd sneaked a peek at Kennedy's autopsy photos and knew Kennedy was shot in the back, and who not only never told the commission the exhibits he'd already had created showing the wound to be two inches higher at the base of the neck were inaccurate, but actively sought to hide this from the commission, is holding Oliver Stone, a Hollywood filmmaker, to a higher standard than himself. He is also off base in asserting that Stone had intentionally deceived people--an assertion for which he offers no proof.)

Look at a few of the falsehoods.

The movie: Kennedy had a large exit wound in the back of his head indicating that the bullet came from the front.

Facts: Kennedy had a small entry hole in the back of his head and a large exit wound at the top front showing that the bullet came from the rear and above.

(Specter is deceiving his readers. He knows full well Stone built his representation of the wound location on the testimony of the Parkland doctors. And he knows this because he himself took the testimony of these doctors. Now, he could make the argument these doctors were largely incorrect, but he doesn't do that; instead, he lets his readers believe this is something Stone made up from whole cloth.)

The movie: Lt. Col. Pierre Finck, an autopsy surgeon at Bethesda, says the government agents at the autopsy ordered a coverup on the medical findings.

Facts: Finck testified under oath before the Warren Commission that an initial bullet hit Kennedy in the back of the neck, hit nothing solid, and exited from his throat - supporting the single bullet theory.

(This is a lie. The movie does not have Finck say a government agent ordered a coverup. It accurately quotes Finck's testimony in the trial of Clay Shaw--the subject of the movie--and has him claim the doctors were ordered by an unnamed Army General not to inspect Kennedy's neck. Specter also misrepresents Finck's Warren Commission testimony. Finck did not say the bullet hit Kennedy in the "back of the neck." He did, however, respond to a question in which Specter described the wound as a "back wound." Specter wrote this article, moreover, in 1992, 13 years after the HSCA published tracings of an autopsy photo proving the wound was a back wound, inches below the "back of the neck." So why does Specter claim Finck said the wound was in the "back of the neck"? Hmmm... Because he's lying?)

The movie: Jack Ruby tells Chief Justice Earl Warren to get him out of Dallas so that he (Ruby) can tell about his part in the conspiracy.

Facts: Ruby testified before the Warren Commission that he had no part in any conspiracy.

(This is another lie. Ruby's statements to Warren in the movie are taken from the transcript of Ruby's testimony. He never says he wants to go to Washington to talk about his role in a conspiracy, only that he cannot tell the truth while in Dallas. It follows then that, since Ruby told Warren he could only tell the truth if Warren brought him back to Washington, that his claims of non-involvement while in Dallas were not intended to be his last words on the matter. Specter fails to reveal, moreover, that Ruby asked him--Specter, personally--to contact President Johnson's top adviser Abe Fortas and ask him to arrange his transfer to Washington, and that Specter failed to do so.)

The movie says there was a gigantic conspiracy involving President Lyndon Johnson, Warren, the FBI, the CIA and many others. For that to be true, Attorney General Robert F. Kennedy (in charge of the FBI), the President's brother, would have to have been a part of - or at least indifferent to - the conspiracy. How ridiculous can you be?

(This is yet another deception. First of all, the movie is told from the perspective of New Orleans DA Jim Garrison, and accurately depicts his conclusion--not necessarily Oliver Stone's, or those of his viewers--that those people and organizations were involved in a conspiracy. Second of all, the bit about Robert Kennedy is just cruel. Specter knew full well that, with the death of his brother, Attorney General Robert Kennedy stepped aside to take care of his extended family. He knew full well, furthermore, that FBI Director J. Edgar Hoover stopped reporting to Kennedy at this time. Now, he also knew that Robert Kennedy soon after sought the Presidency--whereby he would finally be in a position to investigate his brother's death without the interference of Lyndon Johnson and J. Edgar Hoover--and that he was murdered before he could reach this objective. So where does Specter get off judging Robert Kennedy and his failure to act? Is there a statute of limitations on revenge, whereby any brother of a President who refuses to track down his brother's killers--at great risk to himself and his family--within 3 years of his brother's murder is a loyal brother, but one who waits 4 years or more is "indifferent" to his brothers' murder? Of course not. Specter's pretending Robert Kennedy was in control of the FBI, and that his failure to seek revenge in a timely manner means he supported the Warren Commission's conclusions, is both dishonest and disgusting.)

If that far-flung conspiracy involving so many agencies and people could be kept secret for more than two decades, it would have been the most successful undertaking of the U.S. government in its 200-year history.

The Warren Commission concluded that there was no conspiracy. The House of Representatives Select Committee on Assassinations found the "probability" of a conspiracy based on a sound tape, believed to be a recording of the assassination, with two shots 1.6 seconds apart, which would be too fast for both to have come from Oswald's rifle. Further study by the National Academy of Sciences proved that the tape did not record the shots in the assassination.

(This is misleading. HSCA Chief Counsel Robert Blakey and Chairman Louis Stokes both claimed the testimony regarding the "sound tape" only confirmed what they'd already come to believe--based largely on the committee's investigation of Jack Ruby's ties to organized crime--that Kennedy had been killed as the result of a conspiracy. Specter also overstates the National Academy's conclusions.)

It is impossible to prove conclusively a negative - that something did not happen. Had there been a conspiracy, I believe it would have come to light in the intervening 28 years, given the impossibility of

keeping secrets in our free society.

The movie mangles the facts on the single-bullet theory. The House assassinations committee, very critical of the Warren Commission on other matters, confirmed the single-bullet theory.

(This is also misleading. The House committee did not "confirm" the single-bullet theory, at least as pushed by Specter on the Warren Commission. The House Committee, in fact, came up with its own theory, with the bullet hitting at a substantially different wound location, and at a substantially different time, than Specter's theory.)

When the autopsy surgeons disclosed that the bullet, which passed through the President's neck, hit nothing solid and exited with tremendous velocity, it was apparent that a bullet with that trajectory would have to have hit the interior of the vehicle or someone else. We noted that the entry wound on Gov. John Connally's back (slightly to the left of his right armpit) was slightly irregular, which was consistent to some other object's having been hit first without significantly slowing the bullet's velocity.

(Specter fails to tell his readers that Connally's doctor--the only person to inspect his back wound--consistently claimed that the bullet striking Connally had not struck anything before hitting him.)

The commission then conducted elaborate tests such as firing Oswald's rifle at the same distance at substances, recreating the President's neck, to measure entrance and exit velocities; grazing the rib of an anesthetized goat (simulating Connally's rib wound); firing Oswald's rifle at cadaver skulls and wrists; etc.

From the evidence, the single-bullet theory emerged. Using the neutron activation analysis (not known during the time of the Warren Commission investigation), the House committee more than a decade later concluded that the metallic fragments in Connally's wrist came from the single bullet.

(This is another lie, although perhaps an accidental one. The Warren Commission knew about neutron activation analysis. The FBI performed NAA on the bullet fragments, but concluded they were inconclusive. They also performed NAA on the paraffin casts of Oswald's hands and cheek, only to dismiss the results of the tests on Oswald's cheek cast--which suggested he hadn't fired a rifle--due to their being too much barium on the outside of the cast. The FBI expert conducting these last tests, moreover, testified before the commission, with his testimony being published in the commission's volumes.)

Over the years I have debated critics on live television such as Mark Lane on British television for four hours and 45 minutes and Josiah Thompson on Philadelphia public television for two hours at the University of Pennsylvania Law School. I think it is fair to say that the single-bullet theory has withstood the test of time for those willing to listen to the evidence and follow the facts.

*Historians, columnists and media critics have thoroughly discredited and ridiculed the movie JFK. But that is not sufficient for all the men and women who are being defamed by the movie's dredging up stale conspiracy theories that have been discredited over the past two decades. Most of those defamed are not alive to defend themselves. Their families inherit their anguish, as illustrated by television journalist Cokie Roberts, who commented recently on ABC's *This Week With David Brinkley* that the movie was unfair to her father, Louisiana Rep. Hale Boggs, who was a member of the commission.*

(Specter leaves out that few are as defamed by the movie as himself, and that that is why he has written this article.)

Considering the facts that debate continues on the assassination of Abraham Lincoln and just last year the body of Zachary Taylor was exhumed on the suspicion that he was poisoned, it is not surprising that doubt remains about the Warren Report. But then who has read the Warren Report - let alone the 25 volumes containing 17,000 pages of supporting evidence?

(Specter conceals that many of the early critics of the Warren Commission only became critics after reading the Warren Report and its 26--not 25--volumes of supporting evidence--and realizing Specter had both failed to call a number of key witnesses, and pressured others to testify in opposition to their original statements.)

In a curious way, this absurd movie, which no one is taking seriously once acquainted with the facts, may lead people to read and accept the extensive factual analysis and sound conclusions of the Warren Commission's report.

(By claiming "no one" is taking the film seriously once acquainted with the facts, Specter insults the many conspiracy theorists he knows full well take the film very seriously, and misleads those readers not knowledgeable enough to judge one way or the other. The problem, he has to know, is not that those taking Stone's movie seriously just aren't acquainted with "the facts," but that they just don't believe Specter's "facts.")

So there you have it. Specter tried to claim Oliver Stone was a liar, and repeatedly misled his readers while making his argument. Now, does it make more sense for us to believe Specter is both a brazen liar--deliberately deceiving everyone who'll listen--and a STUPID liar--making claims that are easy to disprove--OR that, in the heat of battle, his grasp of the truth became a bit tenuous?

I now lean to the latter. My dealings with McAdams and Fetzer and Mantik et al have led me to believe that really smart but imperfect men are perfectly capable of making really dumb claims, and will quite often defend these claims till the end, pushing more and more nonsense in the process.

Now, let's look for some common ground...

Breaking Through the Wall of Silence

This image from 1970's Handbook of Legal Medicine says it all. Doctors are supposed to protect themselves by protecting their own. It's time for this to stop.

Breaking Through the Wall of Silence

As the mainstream media is incredibly reluctant to deal with the assassination in an honest manner, and as internet discussion groups on the assassination are littered with those who refuse to see, there are few options open to anyone honestly trying to correct the incorrect impressions of the evidence here discussed. So what comes next?

Well, in time I hope to get the input of professionals and experts, make any obvious corrections in my findings, and build a consensus. This building of consensus is quite an arduous task. While I've received positive feedback from a number of historians, several anonymous radiologists, a biophysicist, and even a neurologist, I haven't received one comment for attribution from a medical or science professional using his or her own name.

This is undoubtedly disappointing. While I have read far more about the issues discussed in this online investigation than most doctors, people have a natural tendency to trust "experts" with credentials over those who merely read a lot--as if the reading comprehension of those with letters after their name is automatically higher than that of someone like myself, who opted not to accept the full scholarships he was offered.

This readiness to believe "experts", by the way, is nothing new. Dr. Pitirim A. Sorokin discussed this quirk in the March, 1932 American Journal of Sociology, when he described an experiment in which people were told that musical experts were in agreement that one of two recordings of a classical piece was far superior to the other, and were then played the two recordings. He found that 1) people were incredibly open to suggestion, as less than 5% of his subjects noticed that he in fact replayed the same recording; and 2) people's perceptions were skewed by their awe of expertise, as almost 60% agreed that whichever version they were told was superior, was indeed superior, and barely 40% thought the two recordings (which were in fact the same recording) of equal merit.

Although Sorokin's test subjects were blindly (or should I say deaf-ly) deferring to musical experts, I

suspect the average reader feels at least as lost in the world of forensic pathology as he does in the world of classical music, and that the percentage of people who would automatically defer to the opinions of an "expert" in forensic pathology, no matter how poorly thought-out, would be even greater than 60%. As a consequence, I've attempted to demonstrate, over and over, that the experts on this case are in disagreement, and that much of this case can only be resolved through a re-examination of the evidence. Certainly, with enough study, the "experts" should be able to come to an informed opinion on whether a photograph is of the back of someone's head, or his forehead. It's just that, to do that, they'd have to look at the photograph, and openly discuss their impressions.

Which they're incredibly reluctant to do... As demonstrated on the slide above, taken from a book compiled by Clark Panel member Alan Moritz, books on legal medicine preach conservative behavior and conservative opinions, even if it means withholding the truth. In his 2006 book, *Postmortem*, Stefan Timmermans dissects the culture of medical examiners and comments repeatedly on the conservatism prescribed in these books. He notes: "Consistent with their cautious approach to forensic evidence, medical examiners are more likely to negate police suspicions of homicide with natural explanations than they are to discover a homicide...In routine homicide investigations, medical examiners thus document the pathological and toxicological signs of murder in an ongoing dialogue with law enforcement agencies. In the same way that medical examiners depend on medical histories written by their clinical colleagues to make the case for natural death and suicide, they depend on law enforcement to initiate what will become a forensic homicide investigation. As distinct yet interlinked professionals, police and forensic pathologists continuously and closely coordinate findings and evidence during the evolving investigation, further reflecting the privileged role of law enforcement in the organizational ecology of death investigation. Although forensic pathologists do occasionally discover a homicide, they are more likely to remove the suspicion of it in ambiguous cases. This caution is in line with their conservative approach to drawing inferences from forensic evidence."

In other words, they tend to avoid pushing that something unnatural or unexpected occurred unless they feel reasonably sure something unnatural or unexpected occurred, and rely on those tasked with investigating crimes to give them guidance. This helps explain why both the doctors performing Kennedy's autopsy, and the doctors re-examining the case for the House Select Committee on Assassinations, followed the lead of the investigators. The Dallas Police and FBI agreed it was Oswald firing from the sniper's nest; the autopsy doctors then said the shots came from above and behind (even though there was nothing on the body to suggest the head shot had been fired from above). Similarly, the HSCA received word from Dr. Vincent Guinn that the bullet fragment removed from Connally's wrist matched the bullet found on a stretcher, and that the single-bullet theory was therefore consistent with the evidence, and the doctors, save Cyril Wecht, then jumped in a conga line and said the single bullet theory was consistent with the evidence (even though the damage in the neck was inconsistent with the passage of a military rifle bullet, and the bullet trajectory required Kennedy be leaning forward when hit).

At another point in *Postmortem*, Timmermans discusses the reasons for this conservatism: *"Medical examiners strike a cautious balance in order to maintain authority: they generally opt for conservative interpretations to lower the chance of criticism, and when threatened by knowledgeable parties, they tend to retreat rather than confront."* This, in turn, helps explain why no medical examiners or pathologists have commented, one way or the other, on my online videos critical of Dr. Baden, and his testifying with his exhibit upside down.

Even so, I'm still hoping that some medical professionals and scientists will step up to the plate, and tell me what they really think. I will post their comments, both good and bad, on my webpage.

Why We Fight

I suspect the time is right for such a dialogue. Those assuming that they need to play along with the "conservative" view of the assassination in order to get ahead in the medical profession miss that the medical professionals who have chosen to associate themselves with the single-assassin theory have been among the least credible individuals associated with the case. We have already discussed the failings of Dr. Michael Baden, and the many foolish and easily disproved statements he's made about the assassination. We have also discussed Dr. John Lattimer, a Urologist, with his strange belief Kennedy was a hunchback, and his odd diagrams presenting Kennedy's lung above his throat, and his long-time obsession with Nazis, and his odd habit of collecting celebrity genitalia. We have also discussed Dr. Chad Zimmerman, a Chiropractor, and the many flaws in his "experiments". But what we haven't fully discussed is that there has been virtually NO ONE from the world of medicine to publicly associate themselves with the single-assassin conclusion over the past 20 years, with whom other doctors would want to be associated.

If one gets the opportunity to view a video of the 1993 symposium on the medical evidence held in Chicago one will see precisely what I'm talking about.

First up was Dr. George Lundberg, then editor of the Journal of the American Medical Association. (Thanks to researcher Dave Reitzes for posting Lundberg's statements online.)

Lundberg opened by admitting he knew next to nothing about the case, and then concluded:

"What then and whom then do I trust? I have known Dr. James Humes, the principal autopsy pathologist, personally since 1957. To paraphrase Ronald Reagan, who was paraphrasing Lloyd Bentsen: I know Jim Humes. He's a friend of mine. I would trust him with my life.

Dr. Humes is an outstanding general pathologist, before and after 1963, acclaimed by his peers for thirty years -- forty years, perhaps -- but never was before, during, or after a fully trained forensic pathologist and never claimed to be. He didn't volunteer to do that job; he was assigned.

Moving from 1963 to 1968, the United States Attorney General appointed a four-person, blue-ribbon panel to study and reevaluate the JFK autopsy. The reason that was appointed was a request by the second autopsy pathologist, Dr. Jay Boswell, that there be such an independent investigation. This four-member panel had developed unanimous support for the autopsy report, results and interpretation.

A key member of that panel was the late Dr. Russell Fisher, Chief Medical Examiner for the state of Maryland, probably the world's top forensic pathologist of his time. I knew Russell Fisher. He was a friend of mine. I would trust him with my life. He concurred: two bullets from the rear. A simple story.

In 1979 the forensic pathology subcommittee of the House Select Committee on Assassinations included nine members. It voted eight to one in support of the autopsy findings and basic interpretation. One of the members was Dr. Earl Rose, a forensic pathologist in Dallas in November 1963 whose legal responsibility it was to autopsy President Kennedy and who tried to stop the illegal movement of the body from Dallas.

I have known Dr. Earl Rose since 1973. He is a friend of mine. I would trust him with my life. He concurs: two bullets from the rear.

Another member of that 1979 subcommittee was Dr. Charles Petty. Dr. Petty is Professor of Pathology at the University of Texas-Southwestern Medical School in Dallas, Texas. He heads up the Forensic Science Institute there, which was built in large part because of the Dallas embarrassment over the assassination and their recognition of the need for outstanding forensic science.

Dr. Petty has been quiet on the JFK issue for many, many years. This year he volunteered to write for JAMA on this subject. Last week's JAMA has his editorial, which confirms and explains the Single Bullet Theory.

I have known Chuck Petty since 1968. He is a friend of mine. I would trust him with my life.

These are the keys to trust: Jim Humes in 1963, Russell Fisher in 1968, Earl Rose in 1979 and again in JAMA in 1992, Chuck Petty in 1979 and again in JAMA in 1993, and then there is me.

To imagine or state that somehow these people say we have been duped, misled, or are somehow part of the conspiracy to deny the truth on this issue for all ages, strains the vocabulary to find strong enough words to describe such absurdity. Such charges are somewhere among the descriptors: wild and crazy, off the wall, out in left field in Cubs Park, incredible, insulting, or worse."

Well, this was not exactly scientific, was it? In 1999, for reasons apparently unrelated to his controversial stance on the Kennedy assassination, Lundberg was fired from JAMA.

Next up was Dr. Lattimer, reciting material from his book, claiming he knew Kennedy and Kennedy had a big hump on his back, etc. Then came Dr. Michael West, presenting a program defending the single-bullet theory that he'd previously presented to the American Academy of Forensic Sciences and the FBI Academy. (The former presentation was organized by Dr. Michael Baden, no less.) West recited stuff from Lattimer's book, and showed a film in which it was argued that Governor Connally's delayed reaction to the shot when compared to Kennedy was exactly as one would expect, and that his flipping of his hat circa frame 227 of the Zapruder film was "positive proof" of a neurological response to trauma prior to the point most conspiracy theorists believe he'd been hit. (West was quoted along these lines in Gerald Posner's book *Case Closed*.)

Well, what happened to Dr. West, you might ask?

The 1998 book *Tainting Evidence* notes that Dr. West was a forensic dentist from Mississippi who appeared as a scientific expert in more than 60 trials in 10 states before it became clear he had a knack for seeing marks on bodies that others failed to see. As at least 20 of his appearances were in murder cases in which a suspect's life lay in the balance, moreover, the possibility West was sculpting his testimony to fit the needs of the prosecution slowly dawned on his fellow scientists. As a result, medical examiners (including Dr. Robert Kirschner, one of the ARRB's special consultants) began testifying against West, and he was denounced in a 1996 article in the *American Bar Association Journal*, in which he was called "a sore on the body of forensic science."

The 2008 book *Forensics Under Fire* fleshes out the story, and uses West as a case study of an expert gone awry. Despite West's claims that a special blue light he'd personally developed had allowed him to see the bite marks on victims no one else could see, the "science" of this light was never quite established. As a result other experts began to question West's conclusions, and he gradually fell out of favor. Within a year of his presentation at the 1993 Symposium, in fact, Dr. West was pressured into

leaving the international Association of Identification and the American Academy of Forensic Sciences. He was also suspended by the American Board of Forensic Odontology. As a result, the convictions of two men against whom he'd testified were overturned, and the charges against still another were dropped. Word rapidly got out that his word was suspect, and his court appearances dropped off considerably.

He was so desperate for an appearance, in fact, that he agreed to give his opinion on a case for which he'd not done his homework. In 2001, in an effort to discredit the bite-mark analysis used against a client, lawyer Christopher Plourd hired private detective James Rix to contact West and ask if the teeth in a dental mold provided West matched the bite mark on the breast of the woman purportedly killed by Plourd's client. Two months later, after cashing a check for \$750, West sent Rix a 20 Minute video explaining that, based on West's expert analysis, the odds that "these weren't the teeth that created this bite would be almost astronomical."

Oops. This was a big mistake. The dental mold sent West had not been that of Plourd's client, but of Rix, the private investigator.

And from there things spiraled downward. In 2008, after the arrest of a man who'd admitted killing two toddlers in the early nineties, the lawyers for the two men previously convicted of these crimes called for West's arrest. This led Peter Neufeld, co-director of the Innocence Project, a nonprofit legal organization that examines questionable convictions and has won the exoneration of more than 200 inmates, to declare in an ABC News report that West was "a criminal" and that he'd "deliberately fabricated evidence and conclusions which were not supported by the evidence, the data or the rules of science." Neufeld further claimed "If you fabricate evidence in a capital murder case, where you know that if the person's convicted they are going to be executed — as far as I'm concerned that's the crime of attempted murder." He then concluded "These are not cases of sloppy forensic science. This is intentional misconduct. It's fabricated evidence to send people to death row."

Pretty harsh words. Provocative words. Still, even though Neufeld's charges would seem a clear case of libel (should he not have been telling the truth), West refused to respond to his charges. West did, however, tell CBS' Steve Kroft that he stood by his prior testimony, and that if the DNA evidence implicated someone other than the defendants in the rapes and murders of the children they'd been convicted of killing, it meant only that someone else had raped and killed the children after the defendants had bitten them. Not willing to give an inch, West even stood by his absurd testimony that one of the defendants had bitten his victim 19 times--using only his upper teeth!

And from there things only got worse for wild, wild, West. In February 2009, Reasononline posted links to a 1993 video of West (<http://reason.com/news/show/131527.html>) rubbing a suspect's dental impressions on the cheek of a dead child. Finding bite marks on the cheek, curiously, allowed prosecutors to charge the man responsible for her apparently accidental death with deliberation, and this, in turn, allowed them to seek the death penalty. After seeing this video, Dr. Michael Bowers, a dentist and medical examiner for Ventura County, California, broke ranks with his colleague and told Reasononline that marks appeared on the young girl's cheek after West rubbed the suspect's dental impressions on her cheek because *"Dr. West created them. It was intentional. He's creating artificial abrasions in that video, and he's tampering with the evidence. It's criminal, regardless of what excuse he may come up with about his methods...You never jam a plaster cast into a possible bite mark like that. It distorts the evidence. You take a photograph, or if there are indentations, you take an impression. But you don't jam plaster teeth into them."*

Dr. David Averill, a former President of The American Board of Forensic Odontology, concurred with this appraisal. He told Reasononline *"The video is troubling. I don't know how you can explain where those marks come from. And there's just no justification for him to push the cast into the skin like that...That isn't an acceptable way to perform a bite mark analysis."*

But that wasn't the end of it. The writer of the article, Radley Balko, reported that Forensic Odontologist Richard Souviron, who'd served as an expert for the defendant, Jimmie Duncan, was never shown the video prior to Duncan's trial and conviction, and had signed a new affidavit claiming the video showed *"Dr. West, violently and repeatedly, forcing a mold of Jimmie Duncan's teeth into Ms. Oliveaux's right cheek. In doing so, Dr. West creates a mark that was not previously present. Dr. West's behavior and methods are absolutely not supported by any scientific standards or protocol."* Souviron added in the affidavit that hospital photographs show that *'none of the marks were present when Ms. Oliveaux was at the hospital,' and that the abrasions that Reisner testified about for the prosecution 'were created by the flagrant misconduct of Dr. Michael West.'"*

Is it any wonder then that single-assassin theorists have stopped citing West as an authority? As West was cited as an authority by Gerald Posner in his book *Case Closed*, and as Posner himself was subsequently exposed as a dishonest actor (when he misled people into thinking a forensic re-enactment of the single-bullet theory by Failure Analysis Associates had been performed for him--when it had been performed for the ABA--and had been conclusive--when he'd only shown the prosecution's side of a case that ended in a mistrial), and *worse* (when he told the ARRB that Dr.s Humes and Boswell had told him they'd changed their minds about the location of the entrance wound on the back of Kennedy's head, and now believed it had been in the cowlick--when they denied having done so, or even talking to him) *and even worse* (when he was fired from his position at The Daily Beast for routinely plagiarizing other people's articles), is it any wonder that those taking the case for conspiracy seriously fail to take the arguments of men such as West and Posner seriously?

But Dr. West was neither the last to speak at the 1993 symposium nor the one to make the strangest claims. Shortly after West's presentation, Dr. Robert Artwohl, an emergency room doctor, took the stage and discussed his recent trip to the National Archives. He then flipped through the Kennedy autopsy photos available to the public and discussed his impressions of these photos after inspecting the originals. His impressions were eye-opening. Significantly, and amazingly, Dr. Artwohl insisted that the scalp in the mystery photo had been reflected over the *left* forehead. This was a unique interpretation.

This is almost laughable. There was not on that night, nor on any other night since Kennedy's death, a consensus among America's doctors on the locations of the President's wounds...even among those arguing that one sniper, firing from behind, killed Kennedy. There simply is no "established truth" or "established wisdom" to which one can defer. The doctors blindly "trusted" by Lundberg couldn't agree about the location of the head wound. The doctors on the stage with Lundberg disagreed with those he'd "trusted" on the location of the back wound.

This is not as it should be. While the case may never be solved, it's not nearly as solved as it could be, and ought to be. Certainly, with enough discussion, America's doctors can reach some sort of consensus on what can be observed in the President's autopsy photos and x-rays.

So, if you're willing to smash on through this massive wall of silence, send a comment or criticism to pat@patspeer.com. I won't take it personally. Even the good guys get it wrong sometimes.

I will, of course, reserve the right to comment on your commentary. Even the good guys get it wrong

sometimes.

Now, to that ticklish question of WHODUNNIT...I offer but a morsel to the feast supplied by Anthony Summers in his book *Not in Your Lifetime*, and Larry Hancock in his book *Someone Would Have Talked*.

Silenced Witness?

JFK Exhibit F-114

JFK Exhibit F-113

At left: HSCA exhibit F-114, demonstrating the damage from an M-193 bullet traveling at either 2625 fps. or 800 fps.

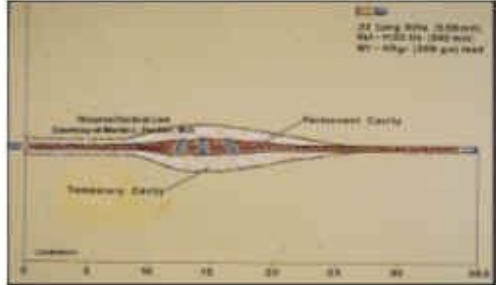

Above: blow-up of intact bullet in F-114

At left: HSCA exhibit F-113, demonstrating the damage from an M-193 bullet traveling at 3000 fps, with mirror at top to show width of wound channel.

Vel-2620 f/s 799 m/s	Vel-2555 f/s 779 m/s	Vel-2523 f/s 769 m/s

Above: test results published by Dr. Martin Fackler demonstrating the break-up of M-193 bullets traveling over 2500 fps.

Above: Fackler depiction of the wound ballistics of a .22 long rifle bullet traveling at 1122 fps. Is the amount of energy release depicted in this wound 43% more than in the gelatin block below? Or 87% less?

Above: F-114, image inverted for comparison

Silenced Witness

After my study of the eyewitness statements and Zapruder film suggested that at least one burst of shots--the one (or two) shots hitting Kennedy and Connally around frame 224--was not heard by the crowd, I decided to read up on the use of silencers and subsonic ammunition. While some "experts", including the FBI's Robert Frazier in the trial of Clay Shaw, have been dismissive about the use of a silencer on 11-22-63, claiming the shots would still have been heard, they ignore that the use of a silencer still had its advantages. Vincent Bugliosi, in his book *Reclaiming History*, admits as much. In arguing that Oswald could not have been a hit man, because a hit man would have used a silencer, he unwittingly undercut many of his supporters, who'd been insisting for years that the use of a silencer was impractical and unlikely. On page 1452, Bugliosi quotes an unnamed LAPD firearms expert and asserts that by 1963 silencers were sophisticated enough to reduce the sound of a rifle to nothing louder than "the hitting of a pile of wood with a hammer." Bugliosi's expert said, furthermore, that state-of-the-art silencers at the time "probably wouldn't have even been heard above the background noise of the motorcade and crowd."

The realization from my study of the eyewitnesses that a silenced weapon may have been fired from the Dal-Tex Building, when combined with Connally's testimony that he initially suspected automatic weapons had been fired, when merged with the fact that both the hole in Kennedy's hairline and the hole in his throat were smaller than what one would expect from a 6.5 mm bullet, and that a smaller caliber would be more easily deflected in the manner proposed, led me to wonder about the availability of .22 caliber automatic rifles in 1963. Surprisingly, I discovered that a brand new .22 caliber automatic rifle, the AR-15, had just exploded on the market, and was, in November 1963, undergoing tests by U.S. Special Forces in Vietnam. The Special Forces is, of course, the wing of the military that works most closely with the CIA, a favorite suspect of the conspiracy community. To make matters worse, the Air Force and Navy had also received shipments, and the Army was in the process of switching from the M-1 over to their own version of the AR-15, re-christened as the M-16. In light of Oliver Stone's theory that the military was behind Kennedy's murder this made me a little paranoid.

While looking through the book *Silencers, Snipers, and Assassins* to see what I could learn about M-16 silencers, I noticed something which pushed me even further down Paranoid Road. When reading about the M16 silencer HEL M4, I noticed on the photo credit that the photo came courtesy of Aberdeen Proving Ground, where both Warren Commission ballistics expert Alfred Olivier and HSCA ballistics expert Larry Sturdivan found employment. (I would eventually discover that a number of experimental silencers had been developed by the Human Engineering Lab (HEL) at the Aberdeen Proving Ground starting in the early sixties but that HEL4A itself did not become available until 1967. I also found that Sturdivan and Olivier did not work in HEL but at the Edgewood Arsenal building of Aberdeen Proving Ground.)

Even so, this coincidence made me wonder if the ballistics experts who'd testified before the committees hadn't had a hand in designing the very weapon used in the assassination. (On page 162 of *Stalkers and Shooters* (2006), one can find yet another assassination weapon designed at Aberdeen Proving Ground--apparently this was one of their specialties.) And so I decided to re-read the pertinent parts of the book *Mortal Error*, which theorized that Secret Service Agent George Hickey mistakenly discharged an AR-15 from the President's follow-up car, and accidentally killed the President.

But then I discovered something even more startling. Illustration #27 within *Mortal Error* included not only HSCA Exhibit #113, which depicted a gelatin test of an M-16 bullet, but a photograph of a list of the other exhibits from the day it was submitted, which had been included in a press package. (This list is now online and can be viewed [here](#)) On this list, Exhibit 114, was identified as an "M-193 bullet at 800 FPS velocity." 800 FPS...as in Feet Per Second...as in slower than the speed of sound, (which travels at roughly 1087 feet per second), which means no shock wave or sonic boom...a silenced shot!

And so I hopped on the internet to download HSCA Exhibit 114. Only when I scrolled through the website of John McAdams, one of the most prominent websites on the net, and certainly the most prominent with a single-assassin bias, I came across something which made me even more paranoid. For on this website Exhibit 113, which represents a gelatin test of M-16 ammunition fired at 3,000 fps, is identified as being the gelatin test of a 30 caliber bullet, and Exhibit 114 is listed as being the "composite of two photographs of bullet exploding in gelatin." All reference to the M-16 and its cartridge, the M-193, were absent! I then went to the History Matters website, where the entire HSCA Report has been scanned and uploaded straight out of a book, and confirmed that officially the exhibits were indeed those of the bullets used in an M-16. I then printed out a list of the HSCA exhibits from the History Matters website and compared them to the same list on the McAdams website, and found that, while there were a few other discrepancies on the McAdams list, there were none back to back which

completely disguised the nature of the exhibits. It really made me wonder if some of the researchers who smell CIA involvement in the single-assassin theorist community weren't on to something. (Months later, after I'd calmed down a little, I realized that the website with the suspiciously incorrect descriptions of F-113 and F-114 was the website of researcher Mike Russ, and that the McAdams website had merely provided a link.)

My concern was heightened yet again when I re-read Larry Sturdivan's HSCA testimony to see if Exhibit 114 was indeed an M-193 bullet shot at 800 fps. He stated, regarding Exhibit 113: "This is the bullet that is fired from the M-16 rifle that was used extensively in Vietnam. It is a caliber .22 but at a high velocity, approximately 3,000 feet per second... This bullet entered, and as you can see, it goes nice and straight for a little while. Then the yaw increases dramatically. The pressure is increased dramatically, and the bullet begins to fragment, pieces are broken off..." He went on to state "F-114 is the same bullet at a lower velocity. That velocity would be encountered at about 800 meters per second... This bullet, of course, was not deformed because the pressures, due to the lower velocity, were never high enough to deform the bullet." Although Mr. Sturdivan is recorded as saying 800 meters per second it occurred to me that the difference between a bullet traveling at 3,000 feet per second and 800 meters per second (2,625 feet!) would not be so great that the slower-moving bullet would fail to deform. Particularly since elsewhere in his testimony Mr. Sturdivan stated that an M-16 bullet "would break up, as I said before, at anything above 1,000 feet per second; it would begin to deform at about 1,000 feet per second." It occurred to me at this point that Mr. Sturdivan's testimony had been changed from 800 feet per second to 800 meters per second. It occurred as well that in all his testimony there was no other use of the term "meters per second." I decided to see if this was true. Upon re-examination of Sturdivan's testimony, I counted 39 mentions of "feet per second," which was the standard unit of measurement used in ballistics calculations, and only the one mention of "meters per second." Within the work he performed in the internet paper written with Kenneth Rahn, Sturdivan mentioned "feet per second" 16 more times, and never once used "meters per second." Furthermore, Alfred Olivier, in his Warren Commission testimony, used "feet per second" 11 times and never mentioned "meters per second." I concluded from this that Sturdivan's testimony was probably changed. The only reason I could come up with is that discussion of silenced M-16 bullets was ruled a violation of national security by someone somewhere somehow. That one or more of these bullets was used on President Kennedy, and that a faction within the government was aware of this and covered it up, might very well explain a lot of our recent history. But this made me uncomfortable, and so I hopped back on the internet to see what else I could find out about the wound ballistics of M-16 ammo.

Well, one of the first things I found was that M-16 ammunition is designed to fragment and incapacitate its victims. While many Americans like to cry about the violations of the rules of war committed by other nations, we decided with the M-16 to defeat the purpose of full metal jacket ammunition, which was promoted and accepted worldwide after WWI to reduce the brutality of war, by creating a bullet that was so unstable that it tumbled and broke-up even though it was technically a full metal jacket bullet. The problem, according to Dr. Martin Fackler, a former military surgeon and ballistics expert considered by some to be the guru of the field of wound ballistics, is that M-16 ammunition fails to break up when striking ballistics gelatin at speeds less than 2500 feet per second, a speed it slows down to after traveling but 200 meters, (or even less, depending on the model and the length of the barrel). Due to the small size of its bullet, therefore, which was designed so that soldiers could carry a lot more ammunition into combat, and its corresponding inability to create massive damage when striking at a reduced speed, the M-16 is ineffective as a long-range sniper weapon.

This gave me momentary doubt about its use in Dealey Plaza. But then I realized that I couldn't

dismiss its use as easily as all that. One reason was that in 1963 many of these tests had not yet been performed, and the assassin would have had no reason to doubt that the M-16 was a top flight killing machine. Another was that all the shots fired in Dealey Plaza were almost certainly less than 200 meters in length, and were probably less than 100 meters, and were therefore well within the M-16's range of optimum performance. Still, another reason to suspect a silencer was used came from my discovery of websites devoted to reduced-charge ammunition, which fires at less than 1,000 fps and creates no sonic boom. Some of this ammunition was even designed for M-16s already equipped with silencers, for the ultimate in silent killing.

It then hit me that Sturdivan had identified the speed of the bullet in F-113 as 3,000 fps when elsewhere in his testimony he said that M-16 bullets were fired at 3,200 fps, and that this 3,200 number was repeated all over the net as the definitive speed of M-16 ammunition. This led me to believe that the F-113 test was a simulation of a bullet fired from a distance of a few hundred feet. The thought occurred then that the F-114 test might be the same, and that the F-114 bullet was originally fired at about 1,000 fps, just under the speed of sound. Subsequently, I came across an article on sound suppressors by Mark White, in which he presents a chart demonstrating the drop-off in decibels of a shot once the speed of the bullet drops below the speed of sound. Not surprisingly, it revealed that a sub-sonic charge fired in a suppressed .308 rifle (under normal conditions, somewhat louder than a Carcano) would be roughly the sound of the surrounding traffic and would be unlikely to be noticed by those more than a hundred feet away (which, in the case of a possible shooter on the roof of the Dal-Tex, would mean almost everyone on the street.) It seemed reasonable to assume from this that Sturdivan had been testing the wounding effects of bullets which he'd already determined would not have been heard, to see if such a bullet was likely. If so, that this whole area of inquiry was hidden from the public would have to be considered suspicious, and might even be taken as an indication he decided such a shot was possible.

Ultimately, however, my decision to accept the possibility that a silenced M-16 was used in Dealey Plaza, and was tested by the HSCA, came from the exhibits themselves. I just couldn't believe that the damage shown in F-113 came as a result of a bullet impacting at a speed only 15% faster than the speed of the bullet in F-114. Since, according to Dr. Fackler, if an M-16 bullet doesn't have enough velocity to cause fragmentation the result is a deep .22 caliber hole, I decided to compare his drawings of a .22 caliber hole to Exhibit F-114. After confirming that both Fackler and Dr. Olivier in his tests performed for the Warren Commission used 15 inch test blocks of 20% gelatin, I found Dr. Fackler's drawings of a .22LR quite similar to F-114. The .22 long rifle wound was slightly deeper, which was as one would expect since a 40 grain bullet traveling at 1122 fps should transfer 43% more energy to the gelatin than a 55 grain bullet traveling at 800 fps. (The formula to determine energy release is mass x speed x speed.) When I considered the opposite, that if the bullet in F-114 was traveling at 2625 fps it should represent 7.5 TIMES THE ENERGY released in the wound in Fackler's drawing, I realized I was almost certainly right, and that F-114 was definitely a test of a bullet traveling 800 fps. When I took into account that Sturdivan told the HSCA, when describing F-113, that after the bullet broke up, "although it is not clearly visible, from here it continues to exit from the corner of the block", it became obvious that the speed of the bullet tested in F-113 was several times that of the bullet in F-114, and that the amount of energy release was somewhere near the fourteen-fold increase in energy release one would expect when comparing a bullet traveling at 800 fps and 3000 fps and nowhere near the 30% increase expected between 800 mps and 3000 fps.

In January 2006, after gathering up the nerve, I contacted Larry Sturdivan and asked him about his HSCA testimony. As to whether Exhibit F-114 represented a bullet strike at 800 meters per second or 800 feet per second he responded: *"It has a simple explanation. I misspoke. The bullet is obviously a*

low-velocity strike, probably at a simulated range of several hundred meters. The figure of 800 feet per second is certainly the one that is closest to the actual impact velocity. At work, I always used metric measure, but for the public hearings it was suggested that I use feet, inches, and pounds. This is one instance in which I slipped. There may be others. In other cases, the person who transcribed the testimony misinterpreted a few of my words. It likely happened with other witnesses for the HSCA and WC as well."

When I asked him if his use of an exhibit depicting an M-16 bullet traveling at a subsonic speed indicated he'd studied the possible use of silenced weapons in connection with the Kennedy assassination, he responded: *"It was just one of the thousands of pictures we had of military bullets we had tested. I used it because it showed the instability of a bullet in a soft tissue simulant, without the deformation and breakup. Like the WCC/MC, it was a bullet that did not deform in soft tissue. Modern military bullets deform at full velocity, so I showed a picture of one at reduced velocity. The only bullets fired in the WC tests were the WCC/MC."*

When I followed up and asked him if the HSCA had ever asked him about the possible use of silenced weapons, he answered: *"Never came up. Several witnesses who were familiar with supersonic rifle fire, such as John Connally, stated that the shots were identifiable as "high-powered rifle" fire. A subsonic bullet is much quieter -- and is much less injurious, has a more arced trajectory (due to its low speed) and, as a result, is much less accurate, etc. A sniper using a subsonic weapon (e.g., a handgun) could fire a volley of shots from the upper floors of the Depository and be unlikely to hit the target with any of them. Such a weapon is more likely to be used in point blank shooting, like the Tippit murder."* (Sturdivan's comments here are intriguing. He ignores the possibility of subsonic rifle fire even though he'd studied the ballistics of subsonic rifle fire, as proven by F-114. His statement that a subsonic bullet has a more arced trajectory is also intriguing when one considers that the trajectory of the bullet creating Kennedy's back wound was initially reported as heading sharply downwards.)

When I wrote back and asked if he felt handicapped by the limits of the HSCA investigation, he wrote: *"No. The HSCA didn't tell me much. They just asked a lot of questions. The most irritating thing is that they kept most of the scientists isolated from each other, so that I didn't meet Bill Hartmann 'til years later."*

Sturdivan's response forced me to do some soul-searching. Here I had taken several pieces of information: 1) that Exhibit F-114 had been misrepresented in Sturdivan's published testimony; 2) that it was in fact the ballistics gelatin of a subsonic bullet; and 3) that it was also misrepresented on a website created by Oswald-did-it theorist John McAdams, and convinced myself that this represented some sort of conspiracy. And yet I was wrong. I was right about points one and two, but they had an innocent explanation. And I was wrong about point 3 altogether. When I realized that it was possible Sturdivan had merely told me a cover story, and that it was also possible that Russ had deliberately misrepresented the exhibit on his website, I had a revelation. In that moment, I fully understood what I will call "the seduction of intrigue". For a split second, it seemed rational to me to assume Sturdivan was lying etc... This was because I had quietly changed gears and begun thinking of reasons to believe I wasn't wrong, rather than reasons to believe that I was right. It occurred to me that such thinking takes place when someone has spent a lot of time developing a theory, and someone else comes along and wrecks it. I at once understood why my presentation had upset so many alterationists, i.e. why they had refused to honestly look at my presentation etc. They'd thought so long and hard when developing their theories that they couldn't bear to believe they'd been wrong. What had been their theory had become their religion.

I decided to lose my religion and accept that the mislabeling of F-114 had been some sort of mistake.

Only it turned out my bout with intrigue was far from over. In April, 2006, I acquired video footage of some of the HSCA hearings, including parts of Sturdivan's testimony. Unfortunately, the footage of Sturdivan began just after he discussed F-114, so I was unable to determine whether he, in fact, said 800 feet or 800 meters. Nevertheless, when I compared the published transcripts of Sturdivan's testimony against his actual testimony, a few new questions arose.

When I e-mailed Sturdivan and asked about these new (at least for me) discoveries, he was once again quite forthcoming. When asked why his published testimony reflects his actual words, when the testimony of Dr. Baden appears to have been significantly re-written, he replied "Perhaps Baden asked to be allowed to revise his own testimony, I don't know." (Another witness, Jack White, told me that every witness was given the opportunity to change their testimony. Perhaps Sturdivan was simply not informed he could do so.) When I asked who changed the exhibit numbers in his testimony—Exhibit 583 was twice corrected to read Exhibit 853-- Sturdivan replied: "I guess Mathews corrected the exhibit numbers." (Mathews refers to I. Charles Mathews, the HSCA Special Counsel responsible for Sturdivan's testimony.) When I asked why some of the questions asked Sturdivan had been changed, Sturdivan's response surprised me. He replied: "In the case of (Congressmen) Fauntroy and Ford, the staff probably published the questions as phrased on the script they were supposed to follow. Some of the Congressmen had trouble following the script -- or just did what politicians do; i.e., speak without thinking what they are trying to say, just because they like the sound of their own voices..." When I asked him WHAT script he was talking about, he clued me in on how the HSCA conducted its "public" hearings. (Dr. Baden had previously mentioned the use of scripts in his 1989 book *Unnatural Death*, but it had fallen below my radar). Sturdivan replied: "*A couple of weeks before the open hearings, I got a copy of the questions to be asked, keyed to each Congressman in turn. I prepared my 'probable answer' to each so that the staff and/or Congressman could pre-prepare any follow-up questions. I.e., the Committee's staff did it. I suggested a few changes to questions and a few additional questions to make the story more complete. However, the Congressmen had a lot of trouble following the script. Some asked questions I had already been asked by another person and did not ask some of the questions they were scripted to ask. As a result the story got scrambled and less understandable.*" In light of the fact that someone (probably Mathews) changed Sturdivan's testimony to reflect the proper exhibit numbers, I asked Sturdivan if he remembered that he mis-spoke and said F-114 represented a bullet traveling 800 meters per second, or had simply assumed he'd done so. His response was illuminating: "*The 800 meters per second, referring to F-114, is an obvious mistake. This is an M-193 bullet. Had it hit at 800 m/s, it would have been deformed, probably would have broken in two, and the bullet (or fragments) would have exited the block. 800 f/s is a handgun velocity that would have produced this type of picture. I don't know whether I said it wrong or they wrote it wrong or later changed it to be wrong.*"

And there it sat until Christmas Eve, 2009, when I received a copy of Sturdivan's HSCA testimony from the Poage Library at Baylor University. I put the DVD in my DVD player, convinced that I would soon be able to resolve whether Sturdivan said "800 meters per second" and confused the HSCA, or said "800 feet per second," only to have some unidentified person change his testimony and exhibits to read "800 meters per second." But I was in for another surprise. Sturdivan said "*F-114 is the same bullet at a lower velocity. That velocity would be encountered at about 800 meters per second*", but then corrected himself and said "*800 meters range.*" This was quite interesting. First of all, at all other points in his testimony, Sturdivan discussed bullet velocity in terms of feet per second, and here he was discussing a bullet's velocity in meters down range. By describing the bullet in such a manner,

Sturdivan thereby hid from the record that the bullet tested was not fired from 800 meters down range, but was a reduced charge bullet designed to simulate the effects of a bullet fired from 800 meters down range. Such a bullet was subsonic. Such a bullet was the type used in weapons designed for silent killing.

In retrospect, Sturdivan's verbal gymnastics only made sense. Sturdivan was, after all, testifying on behalf of a government widely suspected of assassinating its President. He'd done work for the military. Included in this work was studying the wounding effects of the subsonic ammunition used in assassination weapons. Needless to say, this was not a topic the committee would want him to touch upon. And so he testified not how fast the bullet was traveling, but how far down range it would normally take the bullet to slow to that speed. And screwed up.

But it's not as simple as that. While on the surface it seems possible Sturdivan's mistaken claim the bullet was traveling 800 meters per second led someone to not only include this mistake in the transcript, but mistakenly re-title his exhibit, this fails to explain why Sturdivan's correction, "*800 meters range*," was left off his testimony. He was clearly correcting himself. And his words were clearly spoken.

This effectively puts me back where I began, wondering why the exhibit title was changed, and wondering whether it's just a coincidence that this exhibit was of a bullet type used in assassination weapons.

But it also takes me further. In finding that Sturdivan's correction had been omitted from the transcript of his testimony, a door was opened to the possibility that much of what we know FROM SWORN TESTIMONY, is an inaccurate presentation of said testimony.

We'll get back to this in a minute...

The Seduction of Intrigue

The image shows a web browser interface with three stacked banners at the top. Each banner features the CIA seal and the text 'CENTRAL INTELLIGENCE AGENCY' and 'www.cia.gov'. The second banner adds the tagline 'THE WORK OF A NATION. THE CENTER OF INTELLIGENCE.' The third banner promotes 'NATIONAL CLANDESTINE SERVICE CAREERS' with the slogan 'YOU CAN MAKE A WORLD OF DIFFERENCE.' Below the banners is a navigation bar with links like 'Listen to Radio', 'Broadcast', 'Community', and 'Free Downloads'. The main content area shows a profile for 'Hot Christian Acappella' with a 'Play' button. Below this is a photo of John McAdams, an academic political scientist, with a redacted face. To the right is an advertisement for Xbox 360 with the text 'THE BEST MOMENTS ARE ON XBOX 360' and a 'SUBSCRIBE NOW!' button.

In early 2009, I googled the name of single-assassin theorist John McAdams, whom many conspiracy theorists assume is on the CIA's payroll, and came across an acappella internet radio station he runs as a hobby. Strangely, however, the ads across the top of his webpage were all paid for by the CIA. He maintains this was 100 percent a coincidence. This remains hard for me to believe. I mean, what are the odds I'd google YOUR name and find a series of CIA ads above YOUR face?

The Seduction of Intrigue

While trying to figure out if the bullet fired in F-114 had indeed been subsonic, I discovered that there was an historical basis for my suspicion that a small caliber weapon firing subsonic ammunition had been used in the assassination. While reading about the CIA's overthrow of the Guatemalan Government in 1954, I discovered that, among the supply lists, lists of communists to be killed after the take-over, and other documents released in 1997, there was a CIA Manual on Assassination. In this manual there were several relevant passages. At one point, when discussing the advantages and disadvantages of assassinating people with firearms, the manual relates "Public figures or guarded officials may be killed with great reliability and some safety if a firing point can be established prior to an official occasion. The propaganda value of this system may be high." (Note that the propaganda chief for this operation was future Watergate burglar E. Howard Hunt, who, shortly before his death, admitted an involvement in the Kennedy assassination to his son, and claimed David Morales, one of the CIA's para-military trainers for the Guatemalan Operation, and presumably one of those handing out the CIA Manual on Assassination, was also involved.) Elsewhere, the manual deals specifically with the issue of subsonic charges, noting "pistols, submachine guns and any sort of improvised carbine or rifle which will take a low velocity cartridge can be silenced," and then cautioning "Because permissible velocity is low, effective precision range is held to about 100 yards with rifle or carbine type weapons."

Further confirmation came from studying the supply lists prepared for the Guatemalan op. On one such list there is the surprising item ".22 cal. rifles w/silencers." As larger caliber rifles were available, this gives a clear indication that .22 caliber rifles with silencers were a preferred assassination weapon, and that the 100 yard limit mentioned in the assassination manual was true for these weapons. While I've taken a lot of guff from shooters about this, as they all seem convinced that a sniper rifle firing a small subsonic bullet would be nearly worthless at the distances of Dealey Plaza, I suspect their concern is overstated. Geoffrey Boothroyd, the English Firearms expert who advised James Bond creator Ian Fleming on the weapons described in his books, once famously wrote Fleming: "Silencers. These I do not like. The only excuse for using one is a .22 rifle using low-velocity ammunition, i.e., below the speed of sound." Former sniper Craig Roberts, in his book Kill Zone, moreover, wrote of his suspicion that a "CIA-issued .22 caliber Model 74 Winchester silenced sniper rifle" was fired at Kennedy, wounding him in the throat. Subsequent investigation on my part revealed that, yes indeed, the Winchester 74 sniper rifle pre-dated the assassination and is a semi-automatic weapon, meaning it could be fired quite rapidly, causing separate hits on Kennedy and Connally, and creating the illusion they were hit by the same bullet. I found a photo of such a rifle, furthermore, in the 1991 book OSS Special Weapons and Equipment by H. Keith Melton, an expert on the CIA and its predecessor, the OSS. This is reproduced below:

Note that the range is 100 yards, the same as that of the assassination weapons described in the CIA

Manual on assassination.

Elsewhere on the page, the advantages of such a rifle are further detailed.

"A Weapon that eliminates muzzle flash and muzzle noise offers several advantages to special forces personnel.

- (1) The source of the fire is masked.***
- (2) The location of the weapon is difficult for the enemy to pinpoint.***
- (3) The enemy can not identify the numbers or type(s) of weapons firing, or their range.***
- (4) The weapon has less recoil and is more accurate to fire.***
- (5) The enemy is harassed and confused.***
- (6) The sniper has a psychological advantage over the enemy."***

In 2007, at a swap meet, I came across an old book entitled Everyday Ballistics that gave me more reason to believe such a weapon was used on 11-22-63. This book had been the property of the U.S. Navy. In the chapter on bullet drop, it reports that a fully charged .22 long rifle bullet--the type of bullet used in the Winchester 74 rifle--would only drop a foot or so over a distance of 270 feet, the approximate distance from the roof of the Dal-Tex Building to Kennedy at frame 224 of the Zapruder film. In a subsequent chapter, it makes the surprising assertion that a subsonic bullet fired at 1000 fps would suffer less wind deflection than a similar bullet fired at a faster speed. It then specifies that a .22 long rifle bullet fired at 1000 fps. in a 5 MPH cross wind would suffer less than two inches of deflection at 100 yards and less than a half inch deflection at 50 yards. From this it seems clear that a well-practiced shooter firing a silenced Winchester 74 or M-16 from the Dal-Tex Building could easily have hit Kennedy, or Connally, or both.

My study of the evidence suggests the use of such a weapon can not be ruled out. Upon further reading about the M-16, moreover, I realized that it fired three-round bursts in its semi-automatic setting. Since the wounds to Kennedy and Connally circa frame 224 were quite possibly caused by but two bullets, I now suspect the second rifle used in the assassination was a semi-automatic weapon quite similar to the one shown above.

So does that mean I think the CIA was involved? Not necessarily. Let's just say that the killers were probably aware of CIA assassination techniques, and may very well have been CIA-trained. If the CIA suspected as much, it might very well explain why the CIA has been less than forthcoming on so many aspects of the assassination.

Yes, after all this time, literally years spent on this investigation, I still think it's possible that the numerous government lies I've uncovered are unrelated to the assassination itself, and are more indicative of a vast cover-up of information embarrassing to the U.S. Government and City of Dallas than a vast conspiracy to kill Kennedy, and an ongoing conspiracy to cover-up this event.

But sometimes I have to wonder... In early 2009, while preparing to mail out something I'd sold over the internet, using an assumed name, I noticed that the buyer's name was quite familiar. It was John McAdams, the Marquette University Professor whose single-assassin theorist website remains top-ranked by google. Now, by early 2009, I'd sold thousands of items over the internet, none to anyone with whom I'd ever had any contact. And here was the one person with whom I'd had regular contact--through the alt.assassination.JFK newsgroup--who was also widely rumored to be a CIA operative...and he was buying something from me. Did he know the name under which I'd been selling my possessions? Was he sending me a message? Was it even him?

I decided to google his name along with the city provided on the address, to see if it was indeed THE

John McAdams, and not just A John McAdams. And I came across an internet radio station programmed by THE John McAdams with the same home town. Hmmm...I thought. So it is him... Now ain't that a coinkydink... But then I noticed that the three rotating banner ads across the top of McAdams' radio station web page were all sponsored by the CIA. All of 'em. There were other ads off to the side. But the ads above McAdams' face were all CIA ads. Now what are the odds of that? I have contact with one person rumored to be a CIA operative. I find a photo of him online. Above this photo--by pure coincidence?--there are ads placed by the CIA.

I just couldn't buy this was a coincidence. I decided that there must be some sort of connection. It then hit me that most internet ads are placed by computer programs, and that McAdams' having people google his name together with "CIA" may have led some program to associate his name with the CIA, and place ads for the CIA above his name and photo. I mentioned this possibility to a few JFK assassination website owners and they told me that they agreed that this was indeed the most logical explanation.

Some months later, however, McAdams himself insisted this wasn't so. McAdams had stupidly called one of the website owners I'd consulted a "fascist". This, in turn, led me to point out that this man had defended McAdams when I had asked him if the CIA ads had been more than a coincidence. McAdams then grew quite defensive, and claimed that the appearance of these ads above his face was obviously a coincidence, and that only a kook or loony would think otherwise. When I mentioned that it seemed perfectly reasonable to me to assume that someone at the CIA considered his JFK website a friendly website, and wanted to reward him by supporting his music web page, John fought this as well, insisting that, since CIA ads could be found on the home page of the website hosting his radio station, it was all obviously just a coincidence. In the end, he was unwilling to accept any possibility that the ads on his web page were more than a coincidence, even if this possibility reflected no wrong-doing on his part.

So here we were again...at a cognitive divide. Perhaps then, conspiracy theorists are those who see something unlikely--like the one person you know who might have connections to the CIA having CIA ads on the website of their internet radio station--as suspicious, while those denying the possibility of conspiracy see this same event as just another, yawn, coincidence. One side sees what could be a coincidence as a possible clue, while the other side sees what could be a clue as an obvious coincidence.

That said, there's no getting around the nightmarish ramifications of the HSCA's questions and answers having been scripted and re-written, with certain substantive statements excised from the record. This means the supposed "historical record" of the hearings most commonly used by historians--the transcripts--are not reliable records of what actually transpired. Still, this problem is partially offset by the fact there are video and audio tapes of much of the testimony, which may one day be widely available. But what about the Warren Commission? Their hearings were not only conducted in secret, they were not recorded in any way, outside the transcripts. Could their transcripts have been changed as well?

Unfortunately, yes. We know, beyond any doubt, that at least some of the transcripts have been doctored. An apparently unedited transcript of Jacqueline Kennedy's testimony, we should recall, revealed that she originally reported that Governor Connally screamed *"like a stuck pig"* when shot. This reference was deleted from the published transcript. An 8-28-64 memorandum from Commission Counsel Wesley Liebler, in which he cites an early version of the commission's report, moreover, quotes the testimony of the FBI's fiber expert Paul Stombaugh as follows: *"In my mind I feel that these fibers came from this shirt, but I know of no scientific method to prove this, so therefore I am unable to say this."* This differs greatly from the same paragraph in the final report, where his words were changed to *"There is no doubt in my mind that these fibers could have come from the shirt. There is no*

way, however, to eliminate the possibility of the fibers having come from another identical shirt." As the former line appears nowhere in the published transcript, and reads much more like human speech, it seems apparent that this line was re-written and that the new line was added into both the transcript and the report in the final days of the Commission's existence, when their sole focus was on the issuance of the report.

This should force us to question what else was changed, and by whom. It should also make us wonder what guarantees were used to make sure that changes like this one, presumably undertaken to remove the implication of Stombaugh's words--that if there was a scientific method to prove the fibers on the gun came from Oswald's shirt he would have gladly said it had been proven--were the exception, and not the rule, and that greater, more substantive changes were not made as well.

This is a real concern. In 1992, a presumably unaltered transcript of the 4-30-64 testimony of FBI paper expert James Cadigan was released by the National Archives. As reported by Jim Marrs, this transcript revealed that, when asked if he knew why an identification card of Oswald's was damaged by silver nitrate, a chemical used to unveil hidden fingerprints, Cadigan responded *"I could only speculate...It may be that there was a very large volume of evidence being examined at the time. Time was of the essence, and this material, I believe, was returned to the Dallas Police within two or three days, and it was merely in my opinion a question of time. We have a very large volume of evidence. There was insufficient time to desilver it. And I think in many instances where latent prints are developed they do not desilver it."* Well, one can see how the FBI might find this embarrassing. But this was sworn testimony, supposedly taken to create a permanent record of the murder of a president and its aftermath. How can changing Cadigan's rambling answer to *"No, this is a latent fingerprint issue"*, as was done, possibly be justified?

...particularly when, as Marrs reports, the cover sheet to the transcript reveals *"Stenotype Tape, Master Sheets, Carbon and Waste turned over to Commission for destruction"*? I mean, how is this even legal? If anonymous FBI officials and political appointees have the right to change the words of people representing the Bureau in sworn testimony, and to destroy the record of what's been changed, who is responsible if the changes amount to perjury? Someone in the Bureau who never appeared in court? Or the man with the lies shoved in his mouth? I mean, don't the accused have the right to face their accuser, and not have their accuser hide in an office and sneak words into the transcripts of others?

That the cornerstone of the judicial process--the taking of sworn testimony under penalty of perjury--was undermined by the very body tasked with protecting the integrity of the judicial process--the FBI--and done so as a matter of routine--should not be readily dismissed.

Perhaps, then, with time, a scholar will undertake the journey of reading through all the available transcripts, and all the versions of the report, and note the changes, and note all the quotes that were changed in the process. Such an undertaking would be of enormous interest to historians, and possibly win the undertaker a prize or two.

Anyone interested?

The Time for Tests

At left: a photo from a 1998 study of the single-bullet trajectory showing that the bullet or bullets creating JFK's wounds would be unlikely to strike Connally in his armpit. At right: a 1992 study by Failure Analysis Associates showing that the Dal-Tex Building was a likely source for this shot.

At right: an 11-22-63 Dallas Police photo showing the view of the sniper's nest down Elm.

Above: an 11-23-63 photo of the Dal-Tex view by Shel Hershorn.

Since Kennedy's and Connally's wounds don't align for a shot from the sniper's nest, from the angle at right, it's time to test whether they'll align for multiple shots from the Dal-Tex Building, from the angle at left.

The Time for Tests

No? Well, then, how about helping me conduct some tests?

Yes, that's right. While I doubt we'll ever know exactly who killed Kennedy, I believe whole-heartedly that a series of tests can be conducted which will determine beyond a reasonable doubt whether or not Oswald fired all the shots. Here are four that come to mind, in order of priority:

In Test 1 a movie camera like Zapruder's would film simulated shootings of skulls, from a distance comparable to the distance of Zapruder from Kennedy. The shots would be fired at both the entrance described at autopsy and the entrance determined by the HSCA. From this test it could be determined if the Zapruder film should have shown blood spray from the back of Kennedy's head, should he actually have been shot in the back of the head at Z-313. Should it seem likely no bullet impacted on the back of Kennedy's head at 313, needless to say, it could lead to a whole new understanding of the case.

In Test 2 Dr. Olivier's 1964 tests of the effects of M/C ammunition on human skulls would be duplicated, but with a focus on the entrance wound. Should it appear that all the bullets striking the back of the head fragment upon impact, as Olivier concluded, and should it be clear that these fragmenting bullets create entrance wounds much larger than the small entrance wound observed by the doctors at autopsy, as I propose, it could lead to a whole new understanding of the case.

In Test 3, simulated heads placed on simulated necks would be shot at both the proposed entrance locations and exit locations, from a variety of angles, while the head is tilted to the left, to see if the "first forward, and then back-and-to-the-left" movement of Kennedy after frame 312 can be replicated. Should the movement be replicated via an impact at the supposed exit, from either in front, as most conspiracy theorists believe, or from behind, as I propose, it could lead to a whole new understanding of the case.

And finally, in Test 4, Kennedy and Connally dummies would be placed in their relative positions at Z-220--Z-224. Shots would then be fired at these dummies from both the relative location of the sniper's nest using a bolt-action rifle, and the relative location of the upper floors or roof of the Dal-Tex Building using a semi-automatic weapon firing sub-sonic ammunition. From this test it could be determined if the single-bullet theory is more feasible than a semi-automatic weapon's striking both Kennedy and Connally. Should it seem more likely the shots were fired from the Dal-Tex, it could lead to a whole new understanding of the case.

Of course, there are other tests that can be performed to help illuminate the true strength or weakness of the case presented against Oswald.

In Test 5 the proportions of the bag in the Archives would be used to create a paper bag, and this bag would then be photographed in the possession of a man the size of L.D. Montgomery by a variety of photographers, using a variety of lenses. If the press photos of Montgomery holding the bag outside the depository could be replicated, well, I'll eat the cowboy hat I used in my own attempt to replicate the photos. If not, well, then, at least a partial FRAME-UP of Oswald would be proved, and John McAdams and Craig Lamson would owe me an apology.

Test 6 would be another test whose results I suspect we already know. A person would handle and fire a rifle like Oswald's while wearing a shirt like Oswald was wearing when arrested. The rifle would then be dusted aggressively for fingerprints. If a tuft of fibers from the shirt was then found stuck in a crevice of the butt plate, on top of the dusting powder, we could then sleep well that night. If not, well then we would have more evidence for what we should already suspect: that the case against Oswald was in large part a FRAME-UP.

Tests 7 and 8 would be a little trickier and would test the finger and palm prints used in the case against Oswald. In Test 7, a palm print would be added to a rifle barrel through a number of means, including the handling of the rifle, and the planting of an inked print on the rifle. These prints would then be removed from the rifle and compared to the print purportedly pulled off Oswald's rifle. The rifle would then be dusted. This could very well yield interesting results, and shed light on the likelihood the palm print purportedly removed from the rifle had ever been on the rifle, and whether or not the FBI should have found remnants of this print. In Test 8, the trigger guard prints would be freshly analyzed by an impartial team of experts not knowing the identity of the prints on which they were working, to see if any or all of the prints are in fact Oswald's prints, as purported.

Which brings us to Test 9, which might prove price prohibitive... In Test 9, Vincent Guinn's 1964 NAA tests on the paraffin casts would be replicated, only with the shooters mimicking Oswald's actions as accurately as possible, and with the casts being made 8 hours after the test shooting. These numbers would then be compared to the results Gallagher received for the tests on Oswald's casts. Should the counts and antimony/barium ratios in these results be consistent, and consistently unlike the results for Oswald's casts, it could, once again, lead to a whole new understanding of the case.

The Time for Panels

Should one not have the time, finances, or ability to perform such tests, however, one can continue pushing the case in a positive direction by shoring up or debunking my claims the HSCA's investigation was inadequate. Here are but a few of the areas that need to be reviewed by scholars and scientists.

1. The HSCA's pathology panel claimed a bullet entered the cowlick area at the top of the back of Kennedy's head, and left a small red oval entrance in the cowlick area of the scalp. No such entrance was noted by anyone viewing the President's body. Those noting the entrance swore it was down by the hairline. My study of cognitive psychology and forensic pathology suggests this would be unlikely should the wound have been 4 inches higher on the back of the head, as purported by the HSCA panel. A panel of cognitive psychologists and forensic pathologists needs to be convened to determine the likelihood of such a mistake.

2. The HSCA's pathology panel also claimed this bullet broke up upon entry, and left a large fragment from the middle of the bullet at the margins of the entrance wound. My study of wound ballistics suggests this to have been most unlikely. A panel of ballistics experts needs to be convened to establish the likelihood that a bullet breaking up in such a fashion would leave so small an entrance wound.

3. The panel's radiology consultants also noted the presence of metal fragments at the top of Kennedy's head, inches away from the purported entry. My study of the radiology of gunshot wounds suggests this would be unlikely, should but one bullet have entered on the back of the head, as proposed by the HSCA panel. A panel of radiology experts needs to be convened to determine 1) if these fragments were indeed outside the skull, and 2) the likelihood they would end up in this location should the bullet have broken up upon entry in the cowlick, as proposed by the HSCA panel.

4. The emergency room doctors viewing the President's body at Parkland Hospital and the autopsy surgeons viewing his body at Bethesda Hospital all noted a significant portion of missing scalp corresponding to the large defect on Kennedy's skull. Forensic texts have subsequently made the claim such missing scalp can be taken as an indication this defect was an entrance, not exit. This led the HSCA pathology panel to presume all these doctors were mistaken. A panel of cognitive psychologists and wound ballistics experts needs to be convened to determine 1) the likelihood these men were all mistaken, and, 2) if the reported lack of scalp is indeed indicative of entrance.

5. In order to explain the "back-and-to-the-left" movement of Kennedy's head apparent in the Zapruder film, the HSCA's experts claimed both that he'd suffered a neuro-anatomic response to being shot in the head, and that the rush of blood from his head had created a "jet effect." My study of these issues has led me to doubt both these explanations. A panel of wound ballistics experts needs to be convened to determine the likelihood of these explanations, and to determine further if the "back-and-to-the-left" movement can be better explained by Kennedy's being hit on the top right side of his head from behind.

6. The HSCA pathology panel also noted air in Kennedy's neck, which was apparent on the x-rays. They claimed this could have come as a result of Kennedy's tie blocking off the hole in his throat, whereby air from the hole in his trachea backed up into his neck. This reeks of desperation. A panel of wound ballistics experts needs to be convened to determine the likelihood of such a claim, and if this air might be better explained by a bullet or bullet fragment's having traveled down Kennedy's neck. This panel would, of course, have to study this issue independent of all other factors.

7. The HSCA pathology panel also claimed a bullet entered Kennedy's back at the T-1 level and traversed his neck, exiting from middle of his throat at a point slightly above the level of entry. This

entrance was purportedly two inches to the right of his spine. My study of the anatomy of this region suggests such a trajectory would intersect the transverse process of the spine, and pass through a thicket of major blood vessels. A panel of wound ballistics and anatomy experts needs to be consulted to determine the likelihood a bullet on such a trajectory would nick or smash through the spine, and nick or smash through the major vessels of the neck.

8. The experts of both the Warren Commission and HSCA concluded that a Mannlicher-Carcano bullet traversing Kennedy's back without hitting bone would be slowed by the time it hit Governor Connally's back, and that this slowing would explain the lack of damage to the bullet after striking Connally's rib. The numbers presented in support of this, however, have been inconsistent and suspect. A panel of wound ballistics experts needs to be convened to determine the truth of the matter.

Should one not be a scholar or scientist, of course, one can build upon my research and search the available literature for studies and reports not discovered by myself, and then use these materials to further discredit the many dubious conclusions of the HSCA's experts and panels.

It is my fervent belief that such an effort will eventually lead to a tipping point, where even the mainstream media comes to recognize that the conclusions of the HSCA's experts are suspect, and that a re-appraisal of the assassination is both desirable and necessary.

Scintilla

In conclusion, I should make it clear I don't pretend to know who killed Kennedy. The decision within the Johnson Administration to shut down independent inquiry and staunchly defend the flawed conclusions of the Warren Commission does not in itself prove that anyone within the administration was involved in the murder itself, or was deliberately covering up a conspiracy. By way of example, when one studies Lyndon Johnson's expansion of the Vietnam War, one finds that Johnson would frequently worry out loud to his advisers and make them uncomfortable, so uncomfortable in fact that they would tell him what they thought he wanted to hear just so they could leave the room. While this may have been a deliberate tactic of Johnson's designed to get others to back him on controversial decisions (he would often misrepresent what amounted to a capitulation on the part of one of his advisers as a ringing endorsement, saying "I'm just a poor old country schoolteacher, but Walt Rostow's from Harvard, and he says we oughta bomb that country into the stone age, etc."), it's possible this was merely an unfortunate aspect of his character, and one which prevented his receiving the best advice from his best advisers. As a result, it seems plausible that men such as Assistant Attorney General Katzenbach, FBI Director Hoover, and even Chief Justice Earl Warren took from their meetings with Johnson that he'd be much more comfortable if the investigation didn't really dig too deep, and that he (the President) felt this would be the best course of action for the country, for national security purposes, etc. and that they then took it upon themselves to alleviate his concerns. This may not have been his overtly expressed desire. The Watergate burglary and the Iran/Contra scandals are perfect examples of crimes committed and covered up in the President's name, without the President's full knowledge beforehand.

That said, it hardly seems likely that, should Johnson have wanted the Warren Commission to say Oswald acted alone, he would have been shy about letting his feelings be known. It is indisputable that, once he became President, the Senate's investigation into the crimes of his close associate Bobby Baker slowed to a halt. It is also indisputable that a January 10, 1964 phone conversation between Johnson and Senator George Smathers captured the two men discussing the investigation and figuring out how

to get the Republican Senators pushing the investigation to "behave". Irregardless of whether Johnson passively or actively pushed a cover-up, however, it is clear that an inadequate investigation occurred on his watch. It took the United States 90 years to correct its official view on slavery; one can only hope the government's forthcoming admission it erred on the Kennedy assassination will not take as long.

But in the meantime, I'm hopeful I've been able to show those who habitually claim there's just not one "scintilla" of evidence for a conspiracy that there is, in fact, a whole boatload of scintillas. No, scratch that, a flotilla of scintillas. If nothing else, I pray my efforts have lessened the chances of anyone taking the "not one scintilla" argument seriously. In Latin, scintilla means spark. If the evidence in this presentation has sparked your curiosity, then you should conclude there is a scintilla of evidence.

For those of you still in denial, in this presentation, it has been demonstrated that:

1. There was a verifiable lack of interest by the FBI in uncovering the facts of Kennedy's autopsy.
2. The drawings of Kennedy's wounds prepared by the autopsy doctors and presented to the Warren Commission were made without the use of the doctors' measurements of the President's wound locations. They presented a grossly distorted picture of Kennedy's wounds. This distorted picture, moreover, helped sell the single-assassin conclusion. During his testimony, Dr. Humes misled the Commission about the use of measurements in creating these drawings. This seems more than a coincidence.
3. There was a verifiable lack of interest on the part of the Warren Commission in determining the facts regarding the President's wounds, and how these related to the possibility of conspiracy.
4. The assassination re-enactment on May 24, 1964 was deliberately not as accurate as it could have been, in ways that indicate it was designed not to uncover the likelihood of the single-bullet theory, but merely whether it was remotely possible.
5. Warren Commission counsel Arlen Specter elicited knowingly false testimony about this re-enactment from Secret Service Agent Thomas Kelley. This false testimony obscured the fact that Specter and Kelley had used the autopsy photos to determine the location of the President's back wound in order to best test the possibility a bullet entering this location from a rifle in the sniper's nest could exit the President's neck wound and go on to hit Governor Connally in his right armpit. That no photos of the location used were entered into evidence, and that Kelley falsely claimed they'd used the drawings created by the doctors in order to establish this location, suggests that both men were in fact engaged in a massive deception. Perjury and subornation of perjury.
6. A report was created in 1967 that misrepresented the autopsy photos of the President at the very time CBS News was pressuring the administration to create a report confirming that these photographs supported the conclusions of the Warren Commission.
7. When interviewed for the subsequent CBS TV special by Dan Rather, Dr. Humes lied and claimed the autopsy photos he'd recently viewed confirmed the wound locations on the inaccurate drawings he'd provided the Warren Commission. He later provided the ARRB with documents proving that this lie was included on a list of "talking points" provided him by the Justice Dept. in anticipation of his interview.
8. Another report on the medical evidence was created in 1968, and released in the final days of the Johnson Administration. This report is clearly inaccurate in its assertion that Kennedy's back wound was well-above his throat wound. Its re-appraisal of the President's head wounds is also in conflict with the published autopsy photos and X-rays.
9. This incorrect appraisal of the head wound was seconded by the HSCA Forensic Pathology Panel in

1979. To support their conclusions a number of contradictory exhibits were presented.

10. Dr. Michael Baden presented an important exhibit to the HSCA upside down, and inaccurately depicted the President's head wounds to the committee. He made statements in his testimony that, when compared to the pathology report created by his panel, reflected his total confusion about Kennedy's head wounds. He also misled the committee about Dr. Humes' Warren Commission testimony about the head wounds.

11. The enhanced X-rays as presented by the HSCA were cropped in a suspicious manner, with areas of supreme interest in the un-enhanced x-ray, the occipital region of the skull and the upper cervical region of the neck, deliberately excluded.

12. The interpretations of the autopsy photos and x-rays by the HSCA's various panels and consultants were frequently in disagreement with each other. The committee for the most part ignored these conflicts, and presented the reports of the consultants as if they had all been accepted by the committee. While this may have spared the doctors some embarrassment, it left an extremely confusing public record.

13. The X-rays as presented included fractures and fragments that were in conflict with the HSCA's conclusions on the head wounds. While some of these items of interest were acknowledged by the HSCA's radiology consultants, they were left unexplained by the pathology panel.

14. The HSCA's trajectory analysis was conducted against the advice of both its forensic pathology panel and wound ballistics expert and presented false depictions of both Governor Connally's position in the car at Zapruder frame 190, and President Kennedy's posture at frame 313. These false representations supported the committee's conclusions on the single-bullet theory and its assertion that Oswald fired all the bullets striking Kennedy. The "expert" leading this analysis, furthermore, testified that he'd used the precise measurements of Kennedy's skull while creating exhibits depicting the bullet trajectory through Kennedy's skull, but then changed these measurements after he was told the bullet entrance was in a different location. This is clear-cut evidence, proof even, that his "analysis" was a fraud created to tell the public the bullets were all fired from the school book depository sniper's nest.

15. The conclusions of the bullet lead analysis performed on behalf of the HSCA were almost certainly incorrect and were undoubtedly in conflict with the earlier and subsequent writings of its author. These conclusions were also in conflict with the guidelines of the FBI in place at that time.

16. The exhibit titles and testimony of the HSCA's wound ballistics expert were changed in such a manner as to disguise that he'd been studying the wound ballistics of subsonic ammunition. This was apparently done on purpose and without his knowledge.

17. The single-bullet theory simulations and recreations shown on TV in recent years have all been deceptive in one way or another. None of them present the proportions of Kennedy and the locations of his wounds accurately. They are quite often deceptive about Connally's position in the limousine as well. Even worse, neither the Warren Commission, nor any of the subsequent medical panels, nor any of the television programs defending the single-bullet theory, have demonstrated the internal passage of the magic bullet through Kennedy and, specifically, how this bullet evaded bone.

18. The autopsy photos and x-rays available on the internet, whose authenticity has been acknowledged by several of those who've inspected the originals, reveal an entrance on the skull right where the autopsy doctors said it was. I am at a loss to explain why so many men who've viewed the originals of these photos and x-rays, lone-nut theorist and conspiracy theorist alike, including the autopsy doctors themselves, have failed to notice this entrance. If this failure is due purely to human error, then perhaps many of the suspicious "mistakes" listed above are not so suspicious at all. Perhaps the level of competence we expect from our "experts" is simply unrealistic.

Or perhaps I am simply wrong in my appraisal of these photos and x-rays. That's certainly possible. So let's take one last look... And decide, once and for all. Here are two GIF files put together by John Mytton, and posted on the JFK Assassination Forum, which show both that the autopsy photos taken from various angles show the large head wound to be in the same place, and that there is a small hole on the back of the head near the hairline.

Do you see this hole, which is at the 1 o'clock position from the brain matter by the hairline, or not?

And is the head tilted back in this photo, or not?

And, when the tilt of the head is corrected in your interpretation of this photo, does the hole at the 1 o'clock position correlate to the level of the middle part of the ear, or not?

And is the hole at the level of the middle part of the ear in this photo within a few cms of the location of the hole on Kennedy's skull recalled by Dr.s Humes and Boswell, and depicted on Warren Commission CE 386 (below), or not?

If not, well, then, perhaps I'm wrong about these photos...

But am I wrong about all of this?

Has my Gump-like quest been in vain?

Chapter 21: Rorschach Test

"Sinister" and "Obscene"

At 2:38 PM CST on 11-22-63, the day President John F. Kennedy was assassinated in Dallas, Texas, just moments after Kennedy's successor Lyndon Johnson pressured Kennedy's widow Jacqueline Kennedy, still wearing her husband's blood and brains on her clothes, to stand beside him at a completely unnecessary swearing-in ceremony (an act Godfrey McHugh, the General in charge of Air Force One--the site of the swearing-in--said was "*obscene*"), Johnson turned to his right, and looked to his long-time political ally, Texas Congressman Albert Thomas. Thomas rewarded him with a wink and a smile.

Now this unguarded moment could have been lost to history, except for one fact: it was captured on film by White House photographer Cecil Stoughton. Stoughton would later tell writer Richard Trask that when he first looked at the photo he saw "*an enigmatic expression which could be innocent, or sinister, and I have leaned to the latter.*" Trask himself would note that the negative to Stoughton's

"Sinister" and "Obscene"

On Air Force One, immediately after being sworn in as the 36th President of the United States, Lyndon Johnson turned to his long-time crony, Texas Congressman Albert Thomas. As captured in this photo, Thomas gave him a wink and a smile. When asked about this wink, the White House Photographer taking this photo, Cecil Stoughton, acknowledged that it could have been "innocent, or sinister, and I have leaned to the latter." Johnson's own behavior was also questioned. The man in charge of Air Force One, General Godfrey McHugh, complained that Johnson's behavior aboard the plane had been "obscene".

photo of the "wink" *"may have been excluded from those given over to the Johnson Library, due to what someone may have construed as its picturing what the public might perceive as a seemingly inappropriate gesture."* He claimed that it is now, from what he can tell, *"missing."*

Trask should be a politician. Kennedy's trip to Texas, the site of his murder, was built around an honorary dinner for Albert Thomas. It was held the night before the assassination. The "missing" negative shows Thomas winking at President Johnson just as Johnson becomes the most powerful man in the world, mere hours after his predecessor, a man whom he'd routinely and viciously insulted but a few years before, and a man who came to Texas in part to honor the terminally-ill Thomas, had been murdered. As a result, people looking at the "wink" photo don't think "Hmmm, what an inappropriate gesture..." No, they think, "Hmmm, I wonder if something happened there that we're not supposed to know about..."

Particularly in that the negative didn't disappear in transit to the Johnson Library, but sometime before, during Johnson's presidency, and almost certainly on orders of someone close to Johnson... By early 1967, word had gotten out that William Manchester's upcoming book *The Death of a President* would criticize Johnson's behavior on the plane. As a result, those loyal to Johnson were looking for ways to combat the image of Johnson presented in both the book and the soon to be released serialization of the book in *Look Magazine*. Well, the easiest way to do that was to attack Manchester's mistakes. Perhaps the worst of these mistakes was Manchester's embarrassing assertion Kennedy's aides boycotted the swearing-in ceremony on the plane. This mistake was embarrassing, not to Johnson, but to Manchester, moreover, as the (previously unreleased) photos of the swearing in ceremony showed most all of Kennedy's aides on the plane to have been in attendance.

It seems clear, then, that the Johnson Administration decided to strike back. The presence of Kennedy's aides in the photos of the ceremony was first mentioned in the *Boston Globe* and *New York Times*, just prior to Manchester's claim in the 2-21-67 *Look* that they'd boycotted the ceremony. The 2-24-67 issue of *Time Magazine* then published these photos. The article on these photos--and Manchester's inaccurate claim Kennedy's aides had boycotted the ceremony--asserted: *"All of the photographer's take—the full existing photographic record of what happened that day on Air Force One—are printed on the following two pages."* The "wink" photo was, no surprise, not included. Thus, the photo was no longer part of the *"full existing photographic record"* in February 1967.

Thus, outside the copy negative made from an original print found and published by David Lifton in 1980, it no longer existed.

And the suspicious disappearance of this photo and negative is just a drop in the bucket compared to what else one can discover when studying Johnson's behavior in the aftermath of the assassination.

Yes, I admit it. It took me many years to get here (I began writing this book in 2004, and I'm writing this section in 2012) but I now believe Lyndon Johnson had a role in Kennedy's murder. I don't pretend to know what this role was--whether he was the instigator, or merely the guy asked to cover it up afterwards--but his involvement to me seems likely.

There was no single factor in my coming to this conclusion. My sense of Johnson's guilt built up within me over time. And not from reading conspiracy literature, either. From reading statement after statement of Johnson's which I came to suspect was untrue--and from listening to conversation after conversation of Johnson's in which it seemed likely he was lying--and from reading defenses of Johnson by historians in which they sugar-coated his constant lying by saying he was only saying things "for effect," I came to distrust the man. The grandfatherly presence on my TV when I was a child

was really a pathological liar, obsessed with his role in history, and convinced others were out to deny him his proper role.

Not all liars are killers, of course. But my conclusion there was more than one shooter leads me to suspect there was a conspiracy...and Johnson's setting up a commission in part to clear himself makes me wonder if he was involved...and his actions in the immediate aftermath of the killing--and subsequent excuses for those actions--make me think he had something to hide...

Let us then discuss Johnson's behavior on 11-22-63. What he did, and why...

Now, look into this Rorschach blot...and tell me what you see...

The Waiting

On **11-22-1963**, shortly before **1:00 PM CST**, President John F. Kennedy was pronounced dead in Parkland Hospital, Dallas, Texas. Within moments, his successor, Lyndon Johnson, who was also in the hospital, decided to return to Washington. Although his bodyguards told Johnson he should get in the air immediately, there was instead a significant delay. As a result, Johnson spent the second chaotic hour of his presidency on Air Force One, waiting around on the tarmac in Dallas.

The cause of this delay? Johnson himself. The reasons for this delay? Well, for many, they remain as shrouded in mystery as they were on the day of the assassination.

But who doesn't love a good mystery? Now let's explore the record regarding this delay.

First up is a witness who, according to writer William Manchester (who interviewed this witness on 6-15-64) started taking notes on the events of 11-22-63 while waiting at the hospital. Eight days later, she committed her recollections to tape. The transcription of her tape, as provided the Warren Commission on 7-16-64, relates that after Kennedy Aide Kenneth O'Donnell told Vice-President Lyndon Johnson *"The President is dead."* and Acting Press Secretary Mac Kilduff addressed Johnson as *"Mr. President"*, *"It was decided that we would go immediately to the airport. Quick plans were made about how to get to the car, who to ride in what...When we got to the airplane, we entered airplane No. 1 for the first time...On the plane, all the shades were lowered. Lyndon said that we were going to wait for Mrs. Kennedy and the coffin. There was discussion about when Lyndon should be sworn in as President. There was a telephone call to Washington--I believe to the Attorney General. It was decided that he should be sworn in in Dallas as quickly as possible because of international implications, and because we did not know how widespread this incident was as to intended victims. Judge Sarah Hughes, a Federal Judge in Dallas--and I am glad it was she--was called to come in a hurry. Mrs. Kennedy had arrived by this time, and the coffin..."*

This witness, as you've probably surmised, was Lyndon Johnson's wife, Lady Bird Johnson. Note that her husband's decision to wait for Mrs. Kennedy was announced on the plane, and not before. Note as well that Mrs. Kennedy had *"arrived"* by the time Judge Hughes was told *"to come in a hurry."* This suggests either that she'd come onto the plane before Johnson spoke to Hughes or had, at the very least, pulled up outside.

This second scenario is supported, moreover, by our second witness. Johnson secretary Marie Fehmer's typed-up notes on what happened on the plane before Mrs. Kennedy's arrival are of particular interest, and are reproduced in full. The ellipses reproduced come from the typed-up notes. They read *"1:40 P.M. Arrive Air Force One. Go into bedroom of plane to use phone.* (Note: this is presumably a

reference to Johnson's going into the room alone.) *The President had talked to McGeorge Bundy via WH line before I got there. When I walked in, the President looked up and said 'Write this down as what has happened. I talked to the Attorney General...Asked him what we should do...where I should take the oath...here or there...said he would like to look into it...and would notify me whether we should take it here or not... McGeorge Bundy and Walter called me...thought we should come to Washington as soon as could. Told them I was waiting for the body and Mrs. Kennedy. The Attorney General interrupted the conversation to say that I ought to have a judicial officer administer the oath here.'* Then I tried to get Waddy Bullion for the President...he was out of his office. Called Judge Sarah Hughes' office...they said she was not there. The President said that he'd talk to anyone in her office. He got on the phone and told the person at the other end that he needed someone to administer the oath...and to find her...and to get her to Love Field. Judge Hughes called in at 2:02--said she could get to the plane in ten minutes. The President left the bedroom in the plane--where above had taken place--and came into the stateroom to wait Mrs. Kennedy's arrival and to join Mrs. Johnson, J. Valenti, Cong. Thornberry, Cong. Brooks, Cong. Thomas, Rufus Yongblood and MF. Mrs. Kennedy arrived at 2:02 with the body. She was met by the President and Mrs. Johnson and comforted."

Ms. Fehmer's notes further detail that Johnson was finally sworn in at 2:40. As this was two minutes past what would come to be the official time for the swearing-in, one might presume that the clock or watch upon which Miss Fehmer was relying was not 10 or 12 minutes slow, as some might wish to believe, but was, if anything, two minutes fast. This suggests, then, that Mrs. Kennedy actually arrived at 2:00.

Hmmm... The 11-29-63 Secret Service report of one of Johnson's bodyguards, Jerry Kivett, further relates that Acting Press Secretary "Malcolm Kilduff asked me to inquire of the Vice President if he wanted any press to go back on the plane with him. I inquired of the Vice President his wishes in this matter and he said yes, let me talk to Kilduff. I then asked Kilduff to come in and talk to the Vice President. About this time we received word that Mrs. Kennedy and the President's body were on the way. During the discussions that took place in the State Room, the Vice President stated that he had talked with the Attorney General and they agreed that the Vice President should take the oath of office of President of the United States as soon as possible. The Vice President added that he had been able to contact Judge Sarah T. Hughes and she would be at the plane in 10 minutes to administer the oath of office. About this time Mrs. Kennedy and the President's body arrived at the airplane." Well, heck, this suggests that Johnson knew his swearing-in would delay Mrs. Kennedy's departure from Dallas well before the arrangements for his swearing-in had been finalized.

It's actually worse than that. Shortly after the assassination, apparently in December, 1963, Westinghouse put out a 2 album compilation of news reports and discussion regarding the assassination and its aftermath. This was entitled November 22: Dialogue in Dallas. One of the contributors to this album was Malcolm Kilduff. The 2003 book *President Kennedy Has Been Shot* quotes Kilduff from this album, as follows: "As soon as I got to the plane, Jim Swindal, the President's pilot, said 'The President has been looking for you.' I walked in and I talked to the President. He said, 'Mac, I've got to get sworn in here in Dallas. We're trying to get hold of the judge.'" Well, hold it right there. Kilduff left the hospital in the same caravan as Mrs. Kennedy and the body, and arrived at Air Force One just afterward. He almost certainly walked up the steps at the front of the plane while the coffin was being loaded in the back of the plane. So Kivett's recollections were a bit foggy. Johnson had almost certainly received word "Mrs Kennedy and the President's body were on the way" before Kilduff's arrival, and not afterward. This makes Kilduff's quoting of Johnson even more intriguing... He said Johnson told him upon his arrival (presumably a few minutes after Mrs. Kennedy's arrival) that he was trying to get hold of the judge--not that they'd talked to Sarah Hughes and she was on her way. Well, this suggests that Mrs. Kennedy arrived before Judge Hughes called in, and not after.

And this wasn't the only indication this was so. For his book, *The Death of a President*, ultimately released in 1967, William Manchester interviewed Maj. General Chester Clifton, Kennedy's military aide, four times, on 4-21-64, 8-21-64, 1-22-65, and 5-28-65. He interviewed Johnson assistant Jack Valenti two times, on 6-5-64 and 4-26-65. And interviewed White House photographer Cecil Stoughton on 4-27-64. Well, surprise surprise, Manchester gathered from these interviews that, upon Mrs. Kennedy and the body's arrival on the plane, Kenneth O'Donnell had dispatched Maj. General Clifton, who'd traveled in the Kennedy caravan from Parkland, to the front of the plane to find out why the plane was not preparing to take off. In Manchester's account, Clifton was surrounded by Valenti, Stoughton, and Congressman Homer Thornberry, who told him "*We can't go yet,*" and "*We've got to find a federal judge.*"

Yeah, you got it. "*We've got to find,*" not "*we are waiting for.*"

And there's more. In November 1969, the Dallas Chief of Police on the day of the shooting, Jesse Curry, published a short book, *JFK Assassination File*, comprising some of the Dallas police records regarding the shooting, and his personal recollections. Curry had driven the lead car in the motorcade, and had driven Johnson to Air Force One after the shooting. He had stood outside Air Force One to "*direct security operations*" and had witnessed the swearing-in ceremony. And yet, in his book, Curry described the arrival of Mrs. Kennedy and her husband's body, and then claimed "*A short time later I was informed that President Johnson would take the oath of office before leaving Dallas. At that moment, respected U.S. Federal Judge Sarah T. Hughes was already en route to Love Field for that purpose.*" Hmmmm...Curry was directing the security around the plane. If Judge Hughes had called in before Mrs. Kennedy's arrival, wouldn't they have told him about this right away?

It seems likely, then, that Marie Fehmer's notes--which suggest that Mrs. Kennedy arrived just after Judge Hughes called in--were somewhat misleading, and that she actually arrived just before Judge Hughes called in.

In any event, it's reasonable to conclude from all this that Johnson left for the plane without an announced plan, then decided to wait for, first, the body and Mrs. Kennedy, then second, Judge Hughes. The 11-29-63 report of Johnson bodyguard Jerry Kivett also reflects that, upon leaving Parkland and arriving at Air Force One, "*There followed a series of conferences between the Vice President, Congressman Homer Thornberry, Congressman Jack Brooks, and Albert Thomas... I do not recall what necessarily was discussed and at one time or another various members of the White House staff came back to the State Room to talk to the Vice President. It was decided that the plane would remain and wait for Mrs. Kennedy and the President's body.*" And Kivett wasn't alone in his suggestion the decision was made on the plane. The 11-29-63 report of Kennedy bodyguard John Ready reflects that he traveled to the airport with the Johnson entourage, and that "*Upon my arrival at Love Field I boarded the Presidential Aircraft (USAF#I), expecting to depart immediately. It was at this time that I was notified that Mrs. Kennedy and the late President were returning to Washington, D.C. on this plane.*"

The reports of the agents traveling with President Kennedy's body largely support Kivett's and Ready's recollections. None of them mention that they expected Johnson to be waiting for them when they approached the plane. In his 11-29-63 report, Roy Kellerman, the agent-in-charge of the Presidential detail in Dallas, who stayed behind with Mrs. Kennedy at Parkland when Johnson left for the airport, declared: "*The Vice President and Mrs. Johnson had preceded us with Roberts' shift to the airport and when we had arrived, the field had been secured and we rushed to AF 26000. All available special agents carried the casket from the ambulance up the rear steps and placed it in the rear section of the plane. When we boarded the plane, Vice President Johnson and his party were aboard the plane.*" It's subtle, but the implication is that Johnson's presence on the plane came as a surprise.

That this was indeed the case is supported, moreover, by Kellerman's subsequent statements. He was interviewed by author William Manchester on 11-17-64 and 5-12-65. In Manchester's book, it is presented that Kellerman was not only not told that Johnson was leaving the hospital, but that Kellerman was surprised and disappointed to find Johnson on Kennedy's plane. The reason for his disappointment? According to Manchester, Kellerman had a fresh shift of agents ready to take over from the shift that had just lost Kennedy. He'd assumed Johnson would be flying out on his own plane, however, and had ordered this shift to meet Johnson there. Upon arrival at Kennedy's plane, then, and seeing Johnson, Kellerman realized that the tired morning shift traveling with Kennedy's body would have to stay on for a few more hours, only now protecting Johnson.

Of course, the public was told none of this in the days after the shooting. No, what the public got instead were articles like the one found in the **11-23-63** New York Times, written by Tom Wicker the day before, in which Mrs. Kennedy was reported to have left the hospital *"about 2 P.M.,"* and in which the setting then switched to Johnson's swearing-in ceremony, which was *"delayed about five minutes for Mrs. Kennedy's arrival."* The effect of this juxtaposition, of course, made it appear the ceremony was all set to go before Mrs. Kennedy arrived on the plane, but then held up so Mrs. Kennedy could be in attendance.

This, as we know, was just not true. The AP's article on the swearing-in, however, was equally misleading. The version found in the 11-23-63 Sarasota Herald-Tribune (a morning paper) reads: *"The new chief executive repeated the oath in a low, but firm, voice at 1:38 p.m. Central Standard Time."* It then filled in some details: *Dallas Police Chief "Curry had driven Johnson to the airport about 40 minutes before the ceremony. Their destination was not announced when Johnson left the hospital where Kennedy died. White House officials said it was kept secret for security reasons. Johnson decided to delay his swearing-in ceremony until Mrs. Kennedy arrived. She came at 2:18 p.m. when the president's body was brought to the plane. When newsman boarded, Johnson was in a conference room with three Democratic congressmen from Texas--Homer Thornberry, Albert Thomas, and Jack Brooks."* The article then detailed how the swearing-in was further delayed while Mrs. Kennedy composed herself. It even noted that while Johnson was waiting for Mrs. Kennedy, he saw Kennedy's secretary Evelyn Lincoln in the crowd, and kissed her hand. (Note: this last bit seems curious. If it actually happened, it was probably just for show. Johnson and Evelyn Lincoln distrusted and disliked each other--to such an extent on her part that she considered him the top suspect in Kennedy's murder, and to such an extent on his part that he asked her to clean out her desk the next morning.)

And, yes, you read that right. According to the earliest reports of the AP, the largest news service in 1963, the swearing-in of President Johnson was at 1:38 CST, after having been delayed by Mrs. Kennedy, who arrived at 2:18. Well, the only way to read this is that the "2:18" was EST--the time in Sarasota. This would set Mrs. Kennedy's arrival at 1:18 p.m. CST, and 20 minutes before the swearing-in took place.

Now, here's where it gets interesting. The only reporters to fly back on the plane were from Newsweek and AP's rival, United Press International. Perhaps, then, this article was built upon the briefing in Dallas by Westinghouse TV newsman Sid Davis, who'd witnessed the swearing-in, and stayed behind in Dallas to brief the rest of the press corps. But there's a problem with this. Davis reached the plane after Mrs. Kennedy. So where did the AP get that Mrs. Kennedy arrived at the plane at 2:18? It seems likely, then, that this time came courtesy the same *"Washington officials"* telling the AP the secrecy around Johnson's departure was for *"security reasons."*

And that's but the half of it. A subsequent version of the story--this one found in the Miami News (an evening paper)--changed bits and pieces of the story, but still screwed up the most important fact in the

story--the time of the swearing-in ceremony. This article started off by describing the swearing-in itself; it then went back and described the events leading up to the swearing-in. It reported: *"The new chief executive repeated the oath in a low but firm voice at 2:38 p.m. Miami time."* It then detailed: *"Police Chief Curry had driven Mr. Johnson to the airport about 40 minutes before the ceremony. For security reasons their destination was not announced when Mr. Johnson left the hospital where Mr. Kennedy died. Mr. Johnson decided to delay his swearing-in ceremony until Mrs. Kennedy arrived. She did when the President's body was taken to the plane."* It then repeated the information about the newsmen coming aboard to find Johnson talking with the Texas congressmen, and the swearing-in's being delayed by Mrs. Kennedy.

Note that the time previously provided for Mrs. Kennedy's arrival had vanished. Had someone realized that the time provided--2:18--meant (if one interprets it as being EST) that Johnson's departure wasn't actually delayed by Mrs. Kennedy, or (if one interprets it as being CST) that the time provided for the swearing-in earlier in the article (2:38 Miami time) was inaccurate?

And the AP wasn't alone in its confusion. Yes, in a surprising congruence, AP and UPI made the same mistake on 11-23-63; both news services made it seem as though Johnson had held up his departure for Mrs. Kennedy, instead of what had actually happened--that he'd delayed Mrs. Kennedy's departure so he could be sworn-in. Yes, in yet another nationally syndicated article, found in the Central Oregon Bulletin, UPI's Merriman Smith reported that after being sworn-in, Johnson *"turned and kissed his wife on the cheek, giving her shoulders a squeeze. Then he put his arm around Mrs. Kennedy, kissing her gently on her right cheek. Johnson had deliberately delayed the ceremony to give Kennedy's widow time to compose herself for one of the grueling aspects of her husband's assassination. The ceremony took only two minutes. As members of the group of 27 persons jammed in the compartment started to shake his hand, Johnson seemed to back away. 'Now, let's get airborne,' he said."* Note that Smith went out of his way to describe the sweet gentle manner in which Johnson treated Mrs. Kennedy. He failed to report that Johnson had just forced Mrs. Kennedy--a woman who'd just witnessed her husband's head get blown off, and then held his brains in her hands--to sit around on a hot, sweaty plane for half an hour, only to be used as a prop in a photo op. In fact, in a recorded account of the swearing in found on youtube, Smith indicated the opposite--that Mrs. Kennedy's arrival had held up Johnson's ceremony. He described the arrival of Judge Hughes, and then and only then described the arrival of the casket at the back of the plane, Mrs. Kennedy's taking a moment to compose herself in the bedroom, and her dramatic appearance at Johnson's side. Yucch, and double yucch. And, yes, Virginia, he won a Pulitzer Prize for his coverage of the assassination and swearing-in.

And the confusion about the swearing-in was not confined to the timing of the swearing-in. An **11-25-63** article in the Houston Post (reported nationwide by the Associated Press) suggested that Robert Kennedy was responsible for Johnson's delay in leaving Dallas. The article, written by the paper's editor, William Hobby, Jr., a political crony of Johnson's, with a close working relationship with Johnson's freshly-hired assistant, Jack Valenti, related that Johnson had spoken to Robert Kennedy by phone from Air Force One, and that the two had agreed both that Johnson should be sworn in immediately, and that he should not leave Dallas before taking the oath.

This did not go unnoticed. In his 1976 book on Johnson, *A Very Human President*, Valenti admitted that he passed Robert Kennedy in a hall in early 1964, and that Kennedy warned him *"I don't appreciate the leaks coming from the White House and from you. I suggest you cut it out."* Although Valenti then claimed *"I could not for the life of me pinpoint any specific story Bobby was referring to,"* Max Holland, in his book *The Kennedy Assassination Tapes*, concludes it was the Houston Post story on the swearing-in. Holland is probably right about this. Houston was Valenti's home town. He'd had a

newspaper column at the Post for years. He was hired on the spot by Johnson at the hospital, and he flew with Johnson on Air Force One to Washington. His specialty, moreover, was public relations. It only makes sense, then, that Robert Kennedy would think the Post story came from Valenti.

Perhaps, then, Valenti failed to realize why this story would be so upsetting to Kennedy. Perhaps he'd failed to realize that, as Robert Kennedy would subsequently confide, he'd never "agreed" with Johnson that Johnson should be sworn-in in Dallas, and had merely failed to voice an objection.

It's clear, then, that Robert Kennedy had good cause to be angry. Not only had Johnson unnecessarily delayed Mrs. Kennedy's departure from Dallas, he'd been successful in keeping this from the public, and in offering up an excuse should this come to light--an excuse in which Robert Kennedy could be held responsible for the delay.

This led to a rift. While researching his book *Mutual Contempt* (1997) at the Johnson Library, Jeff Shesol discovered two memos regarding an **11-27-63** conversation between President Johnson and Robert Kennedy. According to Robert Kennedy's 1964 oral history interviews for the Kennedy Library, Sargent Shriver, Kennedy's brother-in-law, had told Johnson aide Bill Moyers that the Kennedys were unhappy with Johnson's behavior since the shooting, and Moyers had told this to Johnson. In an attempt to clear the air, then, Johnson requested a meeting. As discussed by Shesol, the first memo, presumably written by Moyers, outlined the topics to be discussed. The very first point to be discussed read as follows: *"The question of the plane's departure. Is it true that LBJ said the plane couldn't take off until he was sworn in? Did Johnson hold up the departure? Why?"* Next on this list was Johnson's treatment of Mrs. Lincoln. The second memo, apparently on the conversation itself, reflected that Johnson had tried to convince Kennedy that the plane *"took off as soon as Jackie got there."* Hmm...this is the same falsehood reported by the Associated Press. Was Johnson--or someone working for Johnson--their source? In any event, if this memo is correct, and Johnson really said this, well then, Robert Kennedy's subsequent actions should not come as much of a surprise--he admitted in his oral history that he didn't feel much like seeing Johnson after this discussion, and did not, in fact, talk to him for several months.

And should one doubt Robert Kennedy's opinion of Johnson was so low that he'd avoid him for months at a time, one should consider that on 2-27-65, in an oral history interview for the Kennedy Library, Kennedy told historian Arthur Schlesinger both that his brother had denounced Johnson on November 21, 1963, the night before the shooting, as one *"incapable of telling the truth,"* and that his own experience with Johnson had borne this out. According to Kennedy, Johnson had tried to convince him at a dinner in 1962 that he'd never actually wanted to be President. Kennedy then added *"my experience with him since then is that he lies all the time. I'm telling you, he just lies continuously, about everything. In every conversation I have with him, he lies. As I've said, he lies even when he doesn't have to."*

But that is neither here nor there. For now. At this stage we need only realize that this question--the question of whether or not Johnson had held up Mrs. Kennedy--and how long she was held up as a result of his decision to be sworn in in Dallas--was at the center of a Johnson/Kennedy rift on 11-27-63, and may very well have been on the minds of the Secret Service agents writing reports over the next few days.

It's undoubtedly intriguing, then, that the **11-29** and **11-30-63** reports of Secret Service agents Roy Kellerman, Paul Landis, Winston Lawson, and Clint Hill reflect that Mrs. Kennedy left Parkland Hospital at 2:04 and that these same reports of agents Landis, Lawson, and Hill reflect that she arrived

at Air Force One at 2:14 or 2:15, and came aboard with her husband's casket at 2:18. If accurate, this cuts the length of Mrs. Kennedy's wait on the plane considerably. It also gives weight to the possibility Johnson thought Judge Hughes would be but minutes behind Mrs. Kennedy when he decided Mrs. Kennedy should wait for the swearing-in.

But something is just off. These reports reflect that it took 10 or 11 minutes to drive the 3 1/2 miles between the hospital and the airplane in a speeding hearse when the 11-22-63 notes of Johnson aide Cliff Carter and Marie Fehmer reflect that Johnson left Parkland at 1:35 and reached the plane at 1:40. These notes are supported, moreover, by the 11-29-63 report of agent Emory Roberts, who specified both that Johnson left at 1:35 and arrived at 1:40. I mean, really...does that make much sense? After interviewing most everyone aboard the Johnson and Kennedy caravans to the airport, William Manchester concluded, in *The Death of a President*, that the Kennedy party traveled "*at least as fast as the Johnson party.*" Why would this trip take the Kennedy party--who were purportedly racing toward the airport--10 or 11 minutes--a time suggesting they drove cautiously in the normal flow of traffic--when it took the Johnson party but 5'?

And so...the million dollar question... Did the agents claiming it took 10 or 11 minutes for Mrs. Kennedy to reach the plane fudge their data to help Johnson? Or is it just a coincidence that the reports of these agents reflect that Mrs. Kennedy arrived 12-13 minutes after Judge Hughes returned Johnson's call and said she would be there in 10 minutes?

These reports, it should be noted, were not just at odds with the notes taken by Johnson and Fehmer, but the 3-23-64 testimony of the Assistant Deputy Chief of the Dallas Police, M.W. Stevenson, before the Warren Commission. Stevenson, who escorted the hearse in which Mrs. Kennedy and the coffin containing her husband traveled to the airport, testified that they left the hospital "*About 1:40 or 1:50. It's got to be somewhere in there, because the body was not held at the hospital but a short while.*"

That Mrs. Kennedy had arrived within moments of Johnson's talking to Hughes--either before or after--is confirmed, we should recall, by the already discussed 11-29-63 report of Johnson bodyguard Jerry Kivett. Kivett claimed "*During the discussions that took place in the State Room, the Vice President stated that he had talked with the Attorney General and they agreed that the Vice President should take the oath of office of President of the United States as soon as possible. The Vice President added that he had been able to contact Judge Sarah T. Hughes and she would be at the plane in 10 minutes to administer the oath of office. About this time Mrs. Kennedy and the President's body arrived at the airplane.*"

Let's be clear about this. Marie Fehmer's notes--the accuracy of which we have some reason to doubt--reflect that Judge Hughes called in at 2:02 and said she'd be there in 10 minutes. If Johnson told Kivett "*she would be at the plane in 10 minutes*" and this was "*about*" the time of Mrs. Kennedy's arrival--which the other agents place around 2:14--well, then Johnson was telling Kivett that Judge Hughes would be there in 10 minutes at a time already past the time she'd said she'd arrive. And that makes no sense.

That Kivett--one of Johnson's own bodyguards--would write such a report, moreover, suggests that the other agents weren't lying, at least not deliberately. Perhaps, assuming they had actually arrived at 2:02, or 2:00, someone had told them they'd arrived at 2:14, or had suggested they add that into their reports. Perhaps they then did so, not realizing it could be used to help Johnson in his brewing war with Robert Kennedy. Or perhaps one of them was mistaken as to the time, and accidentally misled the others. The 3-9-64 testimony of Roy Kellerman before the Warren Commission reflects, intriguingly, that he received the 1:00 PM estimate for Kennedy's death from Kennedy's doctor, George Burkley. Perhaps Burkley had supplied him with the other times as well. Or perhaps Kellerman and the Kennedy detail had received their information from the same "*Washington official*" telling the AP Mrs. Kennedy had

reached the plane at 2:18.

Or perhaps Fehmer's notes were wrong about the "2:02"s provided for Hughes' call and Mrs. Kennedy's arrival.

And as long as we're playing "perhaps"... Perhaps Johnson had failed to subtract the minutes since his phone call with Hughes from the "10 minutes" he'd mentioned to Kivett... And perhaps Kivett had used the expression "about this time" in an equally sloppy manner. If so, Johnson could honestly have said Judge Hughes would be there in 10 minutes at 2:07, and Kivett could observe Mrs. Kennedy arrive "about that time" at 2:14. One just can't say for sure. But one can say for sure that even the timetable offered by the Secret Service agents in their 11-29 and 11-30 reports reflects that Mrs. Kennedy arrived at the plane at 2:14 or 2:15, that she came aboard after the casket was brought aboard at 2:18, and that the plane did not depart till 2:47, 29 minutes later, and 9 minutes after Johnson had been sworn in as President.

Conclusion number 1: Johnson's decision to be sworn in in Dallas had delayed Mrs. Kennedy's departure.

This fact was met with much resistance. On 11-29-63, an AP article by Frances Lewine on Mrs. Kennedy (found in the Telegraph Herald) reported that *"A little over an hour and a half after Kennedy had been taken to Parkland Hospital, his body was taken out a rear entrance. Mrs. Kennedy walked beside it and entered a cream colored ambulance for a police-escorted dash to the airport where the presidential jet plane waited to take the slain president home. Inside, 27 persons crowded into the gold-carpeted presidential compartment. Together, the Johnsons moved to press Mrs. Kennedy's hands in deep emotion as she arrived. Her first public appearance as the grieving widow was to stand there, blood stains still on her clothing, as Lyndon Johnson took the oath of office as President. It was mercifully short--just two minutes."* Well, heck. What nonsense. Mrs. Kennedy arrived on the plane well after 2:00, and the oath-taking commenced immediately? Judge Hughes was, by implication, already there, patiently waiting for Mrs. Kennedy.

An 11-30-63 article in the Deseret News presented a similar scenario. It held that a *"beige Cadillac hearse backed into the hospital ramp"* at 2:00, and was then loaded up with Kennedy's casket. The article then switched locations for its narrative to Air Force One and claimed *"The body of President Kennedy arrived about a half an hour later and was lifted aboard the big jet."* It then reported that Johnson was sworn-in aboard the plane at 2:38. Well, the net effect of this was to suggest (yet again) that Mrs. Kennedy arrived just prior to the swearing-in, and held up the swearing-in ceremony. Hmmm... Where did the approximate time for Mrs. Kennedy's arrival on the plane come from? Did someone provide the uncredited writer of this article false information, or did the writer of this article just guess the time of Mrs. Kennedy and the body's arrival, while assuming she'd arrived just before the swearing-in took place?

Other articles were equally curious. On 12-1-63, the Boston Globe ran an article on "Those Four Days That Changed History." It claimed: *"The casket was closed and wheeled from the hospital, Mrs. Kennedy walking beside it. Declining to ride with the driver she climbed into the rear of the hearse with her husband's body and rode back to the airport where they had been so warmly welcomed a few hours earlier. Even ahead of the hearse, Johnson had been hustled under tightest security to the airport. Now he was waiting in the presidential conference room aboard the big jet, jammed with 25 other persons into a room 12 by 15 feet. At 2:18 pm the hearse pulled up and the casket was lifted aboard the plane. Mrs. Kennedy followed it, and then was taken into the conference room where she stood to Johnson's left, Mrs. Johnson to his right. Standing before them was US District Judge Sarah T.*

Hughes, 67, summoned urgently by telephone from her office. With the huge fanjet engines already whining, Johnson placed his left hand on a small leather covered Bible, raised his right hand and had the 36 word oath of office' administered by Judge Hughes." Well, there it was again: 2:18. Where did this come from? And, more to the point, was the person telling agents and reporters the casket arrived at 2:18 the same person telling reporters Mrs. Kennedy boarded Air Force One, and walked right into the swearing-in ceremony?

And then there's this. On 1-19-64, the Boston Globe published a second account of Johnson's *"first hectic hours"* that made an even stranger mistake. It reported that, upon reaching Air Force One, Johnson's *"first order was to hold the plane on the ground until Mrs. Kennedy and the body of President Kennedy were ready. Plugged into the nose of the plane, as always, was a direct telephone connection to the White House in Washington. Through the White House switchboard, Mr. Johnson could reach anyone he needed. At 1:35 pm Mr. Johnson called Robert Kennedy at his home in Washington. The purpose of the call was both personal--to extend his condolences to the late President's brother--and official. Mr. Johnson wanted to know whether it would be legal to be sworn in at the Dallas airport before he flew to the capital. When the government's chief legal said it would be proper, Mr. Johnson decided to take the oath before take off. He reasoned that it would reassure the country and the world and would help stifle rumors that might otherwise have sprung up before he reached Washington. A second call went to Washington on behalf of Federal Judge Sarah Hughes, who had been summoned to swear in Mr. Johnson. Called from her home to the plane, she had no copy of the presidential oath. Carter called the Justice Department for it--and Deputy Atty. Gen. Nicholas Katzenbach dictated it at 1:45 pm out of a copy of the Constitution. Marie Fehmer typed it out and handed it to Judge Hughes. O'Brien told the President that Mrs. Kennedy wanted to be present at the oath-taking, and when all was ready she was called. At 2:38 pm, Mr. Johnson took the oath."*

Well, did you catch it? Beyond telling us that Johnson called Kennedy within minutes of his arrival on the plane--something that would later be proven untrue--and telling us that Robert Kennedy advised Johnson to be sworn-in in Dallas--something Kennedy would later deny--the article claimed that Marie Fehmer received the words to the oath of office at 1:45--and handed them to Judge Hughes. Well, this was, according to Marie Fehmer's notes, 17 minutes before Hughes had even left for the plane!

So what was going on here? Was some person or entity trying to hide that Judge Hughes had arrived after Mrs. Kennedy, and that Mrs. Kennedy's departure had been delayed as a result?

And that's not nearly the last article in which this simple fact was denied, or concealed. No, the most recent article I've found to deny Mrs. Kennedy's departure was held up by Judge Hughes was published years after the writers of the article should have known better. On 11-20-88, the Dallas Morning News published an extensive overview of the assassination and aftermath. It presented the events in chronological order. Consistent with the reports of the Secret Service, it presented Mrs. Kennedy's arrival at the plane at 2:15. This was not a surprise. What was surprising, even shocking, however, was that the previous entry in the timeline was *"2:12 p.m. Judge Hughes boards Air Force One."* Well, where did that come from? I've looked far and wide and have uncovered no reason to believe she arrived any earlier than 2:30. Perhaps someone working on this article had read Fehmer's notes claiming Hughes called in at 2:02 and said she'd be there in 10 minutes, and had accepted Hughes at her word.

Yes, the "2:12" in this article, 25 years after the assassination, remains a mystery. Could it really be that the people writing and editing this article were unaware that Johnson and Hughes' delay of Mrs. Kennedy had long since bubbled to the surface?

In the aftermath of the assassination, the Associated Press put together a book comprising its photos of the events of November 22-25, 1963, and a narrative describing these events, written by four of its reporters. This book, *The Torch is Passed*, sold upwards of a million copies in December 1963 and January 1964. About the delay of Air Force One's departure, the reporters related first that Mrs. Kennedy and those gathered around her husband's casket at the back of the plane failed to realize Johnson was on the plane until they asked why the plane had not taken off upon their arrival, and were told by Acting Press Secretary Malcolm Kilduff that Johnson was on the plane and waiting to be sworn in as President. The reporters then defended Johnson's presence on the plane. They asserted: *"Lyndon Johnson rightfully occupied the very private presidential sanctum with its desk, easy chairs and twin beds. There at his elbow was the telephone that could connect him, through the plane's complex communications apparatus, with any sector of the globe. Already, Lyndon Johnson was using that phone. It was the one instrument at hand that enabled him to take a quick firm grip on the reins of government."*

But this was nonsense. I mean, really. This was the height of the cold war. If there was a problem with Kennedy's plane, would the President have been grounded? Of course not. If Kennedy's plane had been shot down, or the President incapacitated while overseas, would the Vice President have been forced to go without a plane? Of course not. It seems clear then that Johnson's plane was perfectly equipped to handle a crisis, and the writers of *The Torch is Passed* knew it, and were providing him with political cover.

Should one think the book pure propaganda, however, one should think again. After describing Mrs. Kennedy's arrival on the plane, and defending Johnson's taking over her bedroom, it reported: *"It was 30 minutes before Lady Bird Johnson arrived with U.S. District Judge Sarah T. Hughes..."* Well, this was incorrect on the first part--Mrs. Johnson arrived around the same time as her husband, albeit in a separate car--but it was almost certainly correct on the second. The swearing in took place at 2:38. Judge Hughes arrived just before this, around 2:30. If Mrs. Kennedy arrived 30 minutes before that it would mean she arrived around 2:00, the same time suggested for her arrival by Marie Fehmer's notes. Assuming Fehmer's notes were not its actual source, then, the timeline pushed in *The Torch is Passed* suggests Fehmer was indeed correct regarding the time of Mrs. Kennedy's arrival on the plane.

Conclusion number 2: the mainstream media was incredibly slow to recognize that Johnson's taking the oath had inconvenienced Mrs. Kennedy.

Conclusion number 3: Mrs. Kennedy reached the plane within a few minutes of Judge Hughes' calling in.

Conclusion number 4: the actual times of Mrs. Kennedy's arrival at the plane, and of Judge Hughes' calling in, are unclear.

Long Distance Runaround

We can now focus on two other points of contention: the roles of Robert Kennedy and Kennedy aide Kenneth O'Donnell in Johnson's decision to wait for Mrs. Kennedy at the airport, and fly home on the fallen president's plane.

In his 11-29-63 Secret Service report Kennedy bodyguard Emory Roberts relates that, after arriving at Parkland Hospital and checking on Kennedy's condition, *"I said in effect to the Vice President, in the*

presence of Mrs. Johnson, Mr. Cliff Carter, Executive Assistant to the Vice President and SAIC Youngblood, as well as others, that I did not think the President could make it and suggested that we get out of Dallas as soon as possible. We (SAIC Youngblood and myself) suggested that he (Vice President) think it over, as he would have to be sworn in. I suggested that we leave Dallas via AF 1, and SAIC Youngblood agreed and suggested that we return to the White House... One of the Special Agents assigned to Vice President Johnson called the airport and requested the Presidential plane to stand by to take Vice President Johnson to Washington, D.C...." Roberts then relates that, after escorting Mrs. Johnson to visit Mrs. Kennedy, and then returning to Johnson's side "I left again, this time upon request of the Vice President to double check with Mr. Kenneth O'Donnell if it would be O.K. for the Vice President to take AF 1 and return to Washington, D.C. I located Mr. O'Donnell in hallway and he said "yes." The Vice President was informed that Mr. O'Donnell stated that he could leave. The Vice President said in effect, that he didn't want to leave without the approval of a staff member or the Secret Service. At 1:15 p.m. (according to my watch) the Vice President, in the presence of Mrs. Johnson, Mr. Cliff Carter, SAIC Youngblood and others, was informed by me, that the President was dead. Vice President Johnson said to Mr. Carter to make a note of it and someone mentioned the time as 1:13 p.m. Mr. Malcolm Kilduff, Assistant Press Secretary to President Kennedy, came into the room about that time and it was decided that he would not release the death of the President, until the now President Johnson had left the hospital. 1:35 p.m. The now President Johnson, and I believe Mr. Cliff Carter, departed Parkland Hospital in an unmarked police car, accompanied by SAIC Youngblood."

The 11-29-63 report of Johnson bodyguard Rufus Youngblood further relates that after being told of Kennedy's death *"The Vice President was concerned about wanting to leave quickly as he had been advised to do, and which he now felt that he should, but he was also very much concerned about leaving without Mrs. Kennedy. It was finally agreed, at the advice of Mr. O'Donnell and others of us, that we would leave the hospital and go to AF-1 (President Kennedy's former airplane), with Mr. O'Donnell and others bringing Mrs. Kennedy as soon as they could remove the body."* Youngblood then reported that, upon Johnson's arrival on the plane, and his determination that the oath of office be administered on the plane, *"He also asked me to check on the status and location of Mrs. Kennedy and the President's body, and inform him of their estimated time of arrival."*

Note that at this early date Youngblood claimed merely that *"Mr. O'Donnell and others of us"* had advised Johnson to leave the hospital and go to Air Force One. This plan, it follows, was not necessarily O'Donnell's idea.

The 11-29-63 report of Johnson bodyguard Lem Johns, however, was more specific. After describing a discussion with Dallas Police Chief Jesse Curry, Johns reported: *"I returned to the Vice President and ASAIC Youngblood and heard Ken O'Donnell inform Vice President Johnson that President Kennedy had died. To the best of my knowledge I believe that the Vice President learned from Mr. O'Donnell that Mrs. Kennedy was getting a casket, and would proceed as soon as she could to AF-1 for return to Washington, D.C., with President Johnson on the same plane."*

Well, hmmm. First note the phrase *"To the best of my knowledge I believe"*... This is the language one uses when testifying about something they want you to believe but about which they are unsure. Now note the awkward phrase *"with President Johnson on the plane,"* which has been added onto the otherwise fine *"Mrs. Kennedy was getting a casket, and would proceed as soon as she could to AF-1 for return to Washington, D.C."* Johns' words thereby suggest that someone--quite possibly the large Texan he was tasked with protecting--had asked him to make sure that his report included that O'Donnell had told Johnson to wait for Mrs. Kennedy on the plane. As we've seen, the delay of Mrs. Kennedy's departure from Dallas was the subject of a Robert Kennedy/Lyndon Johnson discussion but two days before. Perhaps Johnson had simply asked Johns *"You remember O'Donnell telling me that, don't cha?"* Perhaps Johns had simply been reluctant to say *"No, Mr. President, I don't recall that."*

Or perhaps Johns was just mistaken. This is all just guesswork, of course.

Still, it seems more than a coincidence that here, a few days after Johnson had failed to convince Robert Kennedy that Mrs. Kennedy's flight from Dallas had not been delayed at all, were three of his most trusted SS agents placing the blame for this delay on an old school chum of Robert Kennedy's: Kenneth O'Donnell. The implications for this are nightmarish, of course. One would like to think that members of the Secret Service were beyond playing politics, and would not let their reports be skewed by political considerations.

And one can find reasons to believe so. Rufus Youngblood was interviewed by writer William Manchester on 11-17-64. Lem Johns was interviewed by Manchester on 11-19-64. And Emory Roberts was interviewed by Manchester on both 12-4-64, and 4-26-65. Manchester's book, *The Death of a President*, was released in 1967. It offered that discussions and actions regarding Johnson's departure from Dallas were clouded by the belief among some there was only one plane at the airport. This was understandable. While waiting at Parkland, Johnson had discussed the usefulness of moving his plane from Love Field to Carswell Air Force Base, for security purposes. This never took place. But some of the agents apparently thought this had taken place. This led them to build their plans for an immediate get-away around Kennedy's plane, and to assume any discussion of a plane at Love Field was a discussion of Kennedy's plane. According to Manchester: *"It may be (as Roberts and Johns later came to believe) that the talk of Carswell had confused them, leading them to think the Vice-President's plane was being moved there."* He then countered *"It is equally possible that the agents, like the man they guarded, were drawn by the halo the press had given Angel."* Angel, of course, was the Secret Service's code name for Kennedy's plane.

Hmmm... So Manchester didn't readily accept Johns' and Roberts' explanation for why they steered Johnson to Kennedy's plane, and why they tried to blame it on O'Donnell.

He was correct not to do so. For, when one studies the bulk of the evidence, it seems clear a secret war was brewing between Johnson and the Kennedys, with the Secret Service in the crossfire... A memo found in the Johnson Library, and discussed by Max Holland in *The Kennedy Assassination Tapes*, reflects that on **12-14-63** General Godfrey McHugh, the Air Force General in charge of Air Force One on 11-22-63, and a close ally of the Kennedys, attempted to determine if the phone calls between Johnson and Robert Kennedy on the day of the shooting had been recorded. One can only assume, then, that Kennedy had asked McHugh to look into this, in an effort to both derail the already published claim Kennedy had told him to be sworn in in Dallas, and prove Johnson the liar he believed him to be. No tapes were found.

On **12-23-63**, however, Johnson's position was propped up for the public via a nationally syndicated article by Robert Buckhorn, of UPI. It was on the events at Parkland Hospital and Love Field as observed by Assistant Press Secretary Malcolm Kilduff. According to the article (which I found in *The Modesto Bee*), Kilduff claimed that when he boarded Air Force One, *"Johnson revealed he had been in contact with Attorney General Robert F. Kennedy. Kilduff quoted Johnson as saying 'They feel I should get sworn in here.'"* Well, there it was--the Assistant Press Secretary quoting Johnson himself, and indicating that Robert Kennedy and others had told Johnson to be sworn in in Dallas.

But, apparently, that wasn't enough for Johnson, who still worried about the loyalty of those around him. On **1-6-64**, at his home, Johnson's bodyguard Rufus Youngblood received a most unusual phone call. It was from Johnson, who was extremely angry about a memo he'd received, written by a former Kennedy staffer. (The name of this staffer is unknown, as the memo from which Johnson was reading has never been located... but it may very well have been Kenneth O'Donnell.) Johnson told Youngblood: *"I've received a memorandum that disturbs me, Rufus. I'll read you some of it. I'm alarmed at the situation that has developed between the President and the Secret Service. Morale in the*

Secret Service is at an all-time low. A number of the members of the White House detail are asking for transfers. This is a great body of men. These men feel they are being prevented from doing their job properly. These men do not want favors; they just want to be accepted. We need them badly, especially in campaign years. They must feel the President appreciates their efforts. If they do something wrong, they do not want to be reprimanded in public over a radio system which lots of people listen to. The attachment this week from Sports Illustrated is an example. I'll do anything you think proper.' Johnson then continued *"I just told Rowley (i.e., Secret Service Director James Rowley) to call all of them in and to take any of 'em's resignations that wanted to. And I'd be glad to have his, if he wants it, or yours or anybody else's. And if they don't want to handle it, well, we'll get the FBI to do it."* Johnson then complained about Secret Service agents following his car too closely when he went for rides on his ranch. He then urged: *"So you get ahold of Rowley and you all call a meeting of your group and (decide) whatever you decide you want to do; and if you want to resign, I'll be glad to accept it forthwith. And if the Secret Service wants to go back to counterfeiting, they can go back to counterfeiting, then I'll get the FBI to just assign me a couple of men to stay by my side without all this God damn big push! I don't know who it is bellyaching. First I heard of it. I'm sorry it didn't come to me. It had to come through some of Kennedy's staffers."* Youngblood then asked who wrote the memo. Johnson responded *"I don't think I ought to do that, but one of Kennedy's top people and somebody has been bellyaching to him. And there's enough truth in it (to see) that somebody talked. And I can't have disloyalty, and I can't talk in front of your people and have them repeat it."* Youngblood then responded: *"You're absolutely right. You cannot have disloyalty and I don't want any transfer, reassignment, or any other damned thing, sir."* Johnson then returned to complaining about agents driving too close to his car. He then repeated his threat: *"So you find out whose morale is low and get rid of the son of a bitch. And if the whole Secret Service is low, I'll tell Dillon (i.e., Secretary of the Treasury Douglas Dillon--Rowley's boss) the first thing in the morning that we'll just change the damned law in about five minutes and turn it over to the FBI because Hoover thinks that I could be handled a lot better anyway. I don't want any of it. I think now's a good time, after Dallas, to make the change, if they want to do it. Now I thought I did pretty well after Dallas and I thought I reflected credit on the Secret Service. I did my damndest to compliment you and everybody else. But if the appreciation I get is going to be articles like this--Kennedy people coming in and telling me that the morale is the lowest in the history--I'm not going to be run by them, you know that."* He then repeated: *"You get ahold of Rowley and y'all see who the hell has been bellyaching and get it straightened out. Take their resignations, get them out of here, and get Lem Johns back and you and Lem Johns handle me. You handle me safer than the forty can, 'cause they're liabilities instead of assets. And if y'all don't want to do it, just honestly say so and I'll get you a good reassignment and I'll get Hoover to send me over a couple of 21-year-old accountants over here and they'll probably do as good a job."* Youngblood then said *"We'll stick with you, sir."* Johnson then finished *"Okay, but I want something done about it, you understand? Good night, Rufus."* (Note: a tape of this phone call is available for listening on The Miller Center website.)

So yes, it's clear. Johnson was not only not above firing individual members of his protection detail should they fail to protect him from criticisms from the "Kennedy people" still among his staff, he was ready and willing to dismantle the entire Presidential Protection Division of the Secret Service should they fail to demonstrate their personal loyalty to him.

(One might note as well that the two agents Johnson specifies for their loyalty--Youngblood and Johns--are two of the three agents whose 11-29-63 reports suggest O'Donnell told Johnson to wait on Air Force One.)

Johnson's concern, or obsession, with how his behavior on the plane would be recorded, moreover, seems evident. In **March 1964**, Lyndon Johnson, a book by Harry Provencher, was re-released in

paperback with a new chapter on Johnson's actions in the aftermath of the assassination. Provence was editor of the Waco Tribune-Herald, and had known Johnson for years. It may be presumed he spoke to Johnson during its preparation. Johnson's close aides Walter Jenkins and Cliff Carter, in fact, were given special thanks in the acknowledgements section of the book. And yet the book held that Johnson called Robert Kennedy from the hospital, and quoted Kennedy as telling Johnson *"you had better be sworn in as President before you start back to Washington."* Well, Provence was a professional journalist, an editor no less. A journalist--a good one anyhow--wouldn't put something in quotes unless it was something someone had actually said, either the person being quoted, or someone else quoting that person. The probability exists then, that Provence's quote of Kennedy came directly from Johnson, or at the very least, one of his assistants, Jenkins or Carter.

It seems clear, then, that Johnson was committed to spreading the word that taking the oath in Dallas had not been his decision.

It shouldn't come as a surprise, then, that on **3-8-64**, when Rufus Youngblood testified before the Warren Commission, he offered a slightly different slant on the events of 11-22-63--one that appeared to further blame Robert Kennedy's school chum O'Donnell for the problematic delay in Dallas. Youngblood explained that at Parkland, after telling Johnson of Kennedy's death, *"Ken O'Donnell said for us to return to Washington, and to go ahead and take the President's plane."* He then expanded: *"O'Donnell told the Vice President that Mrs. Kennedy would not leave the hospital without the President's body. And O'Donnell suggested we go to the plane and that they just come on the other plane. And I might add that, as a word of explanation, there were two jet planes, one Air Force 1, in which the President flew, and the other Air Force 2, in which the Vice President and his party flew on. And O'Donnell told us to go ahead and take Air Force 1. I believe this is mainly because Air Force 1 has better communications equipment and so forth than the other planes. President Johnson said that he didn't want to go off and leave Mrs. Kennedy in such a state. And so he agreed that we would go on to the airplane and board the plane and wait until Mrs. Kennedy and the body would come out."*

Well, wait a second. Who is the "he" in this last sentence? If it's O'Donnell, then Youngblood's recollections seem to support that O'Donnell told him, and not Roberts, that they should go ahead and take Air Force One. If Johnson, well, then Youngblood was essentially stating that Johnson, on his own, had decided to wait on the plane for Mrs. Kennedy and the body. Youngblood doesn't say, after all, that O'Donnell was still standing there when Johnson agreed to wait on the plane. It seems possible, for that matter, that Youngblood's claim *"O'Donnell told us to go ahead and take Air Force 1"* was just a mutation of what Emory Roberts had told him, and that Youngblood himself had never heard O'Donnell say as much, or specify that by saying Air Force One, he meant Kennedy's plane.

In any event, if Johnson's bodyguard Youngblood had taken to exaggerating O'Donnell's influence on Johnson on the day of the shooting, it may have been from instinct--that he was trying to protect Johnson. The "Kennedy people," it seems clear, were now openly complaining about Johnson's behavior on the plane, and Secret Service agents are not deaf, nor above sharing gossip with other agents. Talk was in the air. Historian Arthur Schlesinger's Journal entry for **3-25-64**, in fact, reflects that he had lunch with Kennedy's former secretary Evelyn Lincoln, and that she continued to resent the fact that *"LBJ and his entourage moved into Air Force One instead of letting JBK (Jackie) and the President's friends take the body back to Washington by themselves."*

That this talk had made its way to Youngblood, moreover, is also supported...by Youngblood. In his 1973 book *20 Years in the Secret Service*, Youngblood described the events at the airport, then admitted: *"Months later, amid all the sniping and second-guessing, Johnson was criticized for 'usurping' the Presidential aircraft."* Note that he says "months later." This would be right around the time he testified.

Meanwhile, behind the scenes, William Manchester began work on his book *The Death of a President*. On **4-10-64**, Manchester interviewed CIA Director John McCone. (A transcript of this interview was placed in the CIA's files. It was declassified in October, 1998. It is 15 pages long. Manchester's notes on this interview were first made available in 2009, and are only 4 pages long. This suggests that McCone taped his conversation with Manchester, but that Manchester was not allowed to tape McCone. I guess this isn't much of a surprise.) In any event, McCone told Manchester that after hearing of the shooting, he called Robert Kennedy *"through the White House. When I got him at his home he told me he was at home, and he asked if I would come right over."* McCone then described Kennedy's mood and activities. He then claimed he'd overheard Robert Kennedy's conversations with Johnson on the day of the shooting, and that after being asked about the oath of office in a first call *"He contacted his office--and I've forgotten just who in that office--to find out exactly just who could or should administer the oath. He found that any federal judge could do it, and he transmitted that information together with appropriate references so they could get the exact oath down to Dallas. He insisted that the swearing in be done immediately. I think President Johnson felt the same way. He did not want the country to go the two hours and a half that President Johnson would be in the air without a President. And that was arranged. This involved several phone calls."* McCone then described the arrival of a Catholic Priest. He said that this priest *"sensed that the Attorney General was involved in the myriad of problems that arose almost at once, you know--his concern over Mrs. Jacqueline Kennedy, his concern over the swearing in of the President."* He then continued: *"There was a period of half an hour, I suppose, that he was debating whether to fly to Dallas himself to return with the body and with Mrs. Kennedy. I urged that he not do that, stating that there was an element of time--that the best thing to do would be to bring the president's body up as quickly as possible, as quickly as it could be released, and he couldn't possibly get down there for three or four hours, by the time he got aboard a plane and got down there, and he would be out of touch all the time that he was in the air. He agreed with this, and as a result either decided or agreed with the decision that the body should be brought up with President Johnson and Mrs. Kennedy just as quickly as possible."*

Hmmm...so McCone told Manchester Robert Kennedy not only told Johnson he should be sworn in in Dallas, but that he--Robert Kennedy--had *"either decided or agreed that the body should be brought up with President Johnson and Mrs. Kennedy."* Hmmm...is this credible? This not only exonerates Johnson for the swearing-in's taking place in Dallas, but Mrs. Kennedy's returning on his plane. This is mighty curious, and suspicious when one takes into account Robert Kennedy's statements on the matter. Perhaps, then, Johnson got to McCone.

Or perhaps--if one is to be paranoid, this is the time--McCone and Johnson had both been "gotten to." Yeah, I know this smells like dog dirt, but indulge my paranoia for a second... McCone told Manchester that upon hearing of the shooting, he called Robert Kennedy, and that Kennedy asked him to come right over to his house. He then claimed he'd spent the next hour or so walking around Kennedy's house and grounds, talking to him about the assassination in between the incoming calls.

Well, wait a second. McCone was the Director of the Central Intelligence Agency, not some retired businessman or old friend. Didn't he have a job to do? Shouldn't he have been at CIA Headquarters, digging up everything he could regarding a possible conspiracy? Shouldn't he have been on the phone, calling up everyone he knew to find out everything he could? His holding Bobby's hand in a time of national crisis simply makes no sense--unless one is to assume this was something previously agreed upon by the person to whom McCone would now be reporting, Lyndon Johnson. Yes, shockingly, there is no record of McCone talking to Johnson--who purportedly suspected a Russian or Cuban attack from the outset--on the day of the shooting. Johnson received briefings from National Security Adviser McGeorge Bundy and Secretary of Defense Robert McNamara, but there is no record of him talking to CIA Director John McCone until the next morning.

Heck, the record of what was discussed the next morning is also kinda suspicious. On 11-25-63 McCone created a memo on this, his first meeting with his new boss after the killing of his old boss. This memo reveals that they met at 9:15 in the office of National Security Adviser McGeorge Bundy, and that the meeting lasted *"approximately 15 minutes."* The memo reveals as well that they discussed their own personal and professional relationship--that there were a number of issues that had arisen during the Kennedy Administration on which they'd *"seen eye to eye."* It then reveals that McCone had *"confirmed"* his confidence in Johnson, as well as his *"desire to help and support him in every way..."* McCone then describes their reviewing details of the *"President's checklist"* and their agreeing to meet every morning for the next few days. That's it. The meeting lasted but fifteen minutes. Apparently, there was no extended discussion of Oswald, or of Russian activity.

Now contrast McCone's 11-25-63 memo with the transcript of his 8-19-70 interview with the Johnson Library. When asked when he first saw Johnson after the shooting, McCone replied *"I think I saw him at his home that night."* (This was incorrect. Johnson's calendar of phone calls and visitors shows it was the next morning-- a fact confirmed by McCone's 1964 interview with Manchester, where he claimed *"I did not see him that evening when he arrived--I saw him the next morning, and I saw him every day for a long time--sometimes several times a day."*) In any event, when then asked Johnson's mood during this meeting, McCone replied: *"Well, his mood was one of deep distress over the tragedy, and grave concern over how to get his arms around the problems that confronted him--some concern over how to properly handle the men in the organization whose competence he recognized, but also whose allegiance to President Kennedy-- And, of course, you know the background of issues that arose that dated 'way back to the convention here in Los Angeles and even before."*

Well, wait a minute. The man whose competence Johnson recognized, with whom he'd had a problem dating back to the convention and even before, was Robert Kennedy. Did Johnson spend his first meeting with John McCone, the Director of the Central Intelligence Agency--the agency tasked with determining the likelihood Russia, our number 1 enemy of the day, had backed the main suspect in the shooting, Lee Harvey Oswald--talking to McCone about "Bobby"?

I don't know. This kinda bothers me. It makes me say "hmmm..."

On **5-16-64** Manchester interviewed Robert Kennedy. The recording of this interview, while still withheld from the public, was made available to Arthur Schlesinger for his 1978 book *Robert Kennedy and His Times*. According to Schlesinger, Kennedy claimed *"John McCone called me and said 'I'll come out,' and he came out..."* Hmmm... McCone told Manchester that Kennedy had asked him to come over, while Kennedy, in his interview with Manchester, said nothing of the thing, and suggested instead that McCone had come over without even being invited.

And that's just the little "hmmm..." According to Schlesinger, Kennedy described the phone call Johnson made to him as follows: *"First he expressed his condolences. Then he said... this might be part of a worldwide plot, which I didn't understand, and he said a lot of people down here think I should be sworn in right away. Do you have any objection to it? And -- well, I was sort of taken aback at the moment because it was just an hour after... the President had been shot and I didn't think -- see what the rush was. And I thought, I suppose at the time, at least, I thought it would be nice if the President came back to Washington -- President Kennedy... But I suppose that was all personal... He said, who could swear me in? I said, I'd be glad to find out and I'll call you back."* Schlesinger then wrote that Kennedy called Katzenbach, and found out any federal judge could give Johnson the oath. Schlesinger then returned to quoting Kennedy: *"So I called Johnson back and said anybody can..."* Kennedy's account of the call was thus in line with Marie Fehmer's notes on every point but one--a big one-- Kennedy didn't mention telling Johnson he should be sworn in in Dallas during the second phone call.

And Kennedy wasn't the only one pushing against the tide. In his **5-18-64** testimony before the Warren

Commission, Kenneth O'Donnell insisted that, at Parkland Hospital *"As soon as I was assured that he (Kennedy) was dead, and it was definite, I went back to the Vice President and informed him the President was dead, and that in my opinion he ought to get out of there as fast as he could. We had a general discussion. The President's first words to me were that we must look upon this in a sense that it might be a conspiracy of some nature, and that all security must be taken..."* O'Donnell then claimed Johnson started discussing some security measures he might take at the airport, such as moving the plane to a nearby military base, but that he shot Johnson down on this matter, reiterating that Johnson should leave without delay, and that *"it would be much better if he got to the field immediately, where he was under security, and got aboard one of the aircraft."* O'Donnell then claimed that he didn't specify which plane Johnson should board, Air Force One or Air Force Two, which were nearly identical. He then testified that when he arrived at Air Force One with Mrs. Kennedy and the president's body *"I didn't know whether it was 1 or 2, to be honest, until I saw the members of the crew"* and that, prior to the loading of President Kennedy's casket onto the plane, *"I didn't know President Johnson was on the plane."* He was then asked point blank if there had been any discussion of President Johnson's waiting for Mrs. Kennedy on Air Force One while at Parkland, and responded: *"There had been no discussion of that to my knowledge. Once the President--the Vice President--left, I left him, I had not seen him again. I had been notified he had departed, I had been notified that he arrived, and that was the last I heard of it, until I got on the airplane."* He was then asked what happened after he realized Johnson was on the plane, and waiting to be sworn in: *"the President and I carried on a conversation, which, again my recollections might be hazy--that it had been brought to his attention that I had asked for the plane to take off, and that there was some difference of opinion between him and me. He said to me that he had called the Attorney General, and that the Attorney General had indicated that it was, if not mandatory, at least preferable that he be sworn in prior to the aircraft taking off. I didn't describe what I saw as the problems. I realized it was an inevitable delay. So I don't believe I commented on it. I just listened to him. We sat there."* Hmmm... O'Donnell backed down after being told Robert Kennedy had said the swearing-in was preferable. Apparently, Johnson had said something similar to Jacqueline Kennedy. Presumably, Robert Kennedy, Jacqueline Kennedy, and Kenneth O'Donnell were now telling everyone who would listen that Robert Kennedy had never said such a thing...and that Johnson had lied and manipulated them when they were at their weakest.

Unfortunately for Johnson, for that matter, one of his closest cronies was unable to help him in his ongoing effort to blame O'Donnell and Robert Kennedy for the decisions made in Dallas. On **5-20-64**, Johnson assistant Clifton Carter provided an affidavit to the Warren Commission that tried to keep the peace. It read: *"At 1:12 p.m. Special Agent Emery Roberts brought the news that President Kennedy was dead. At that moment the only people present were Vice President Johnson, Congressman Thornberry, Special Agent Lem Johns, and I. Special Agent Roberts advised Vice President Johnson to return to the White House forthwith because of the concern of the Secret Service that there might be a widespread plot to assassinate Vice President Johnson as well as President Kennedy. Vice President Johnson then asked that Kenny (O'Donnell) and Larry (O'Brien) be consulted to determine what their views were on returning promptly to Washington. Kenny and Larry came down and told Vice President Johnson that they agreed he should return to Washington immediately. Vice President Johnson then asked me to try to alert some of the members of his staff to go to the airport for the return trip to Washington. I then proceeded to look for those members of the staff, and I was later driven to Love Field by a young Dallas policeman. By the time I returned to the Presidential plane (AF-1), Vice President and Mrs. Johnson had already boarded the plane and arrangements had already been made to have Vice President Johnson sworn-in as the President. I do not have any personal knowledge of Vice President Johnson's conversation with Attorney General Kennedy concerning the advisability of a prompt swearing-in or of the arrangements to have Judge Sara Hughes participate in that ceremony. I was present at the swearing-in and shortly thereafter the President's plane took off for the Washington*

area."

And that wasn't the end of a bad week for Johnson. Unfortunately for Johnson, one of Kennedy's closest cronies was in a position to help, but did not. On **5-26-64** Lawrence F. O'Brien testified before the Warren Commission. O'Brien had been a close Kennedy aide. Unlike O'Donnell, however, he'd retained much of his influence under Johnson. This made his statements especially intriguing. And they didn't disappoint. First and foremost, he suggested that Johnson's presence on Kennedy's plane came as a surprise to both Kenneth O'Donnell and himself. He told the Commission that, after helping lift Kennedy's coffin onto the plane, he *"noticed that seats to the left of the door had been removed, leaving a floor space in the plane to place the coffin. We placed the coffin on the floor. Then I looked up, and the President and Mrs. Johnson were at the corridor that would go into the compartment from that area of the plane."* He then testified *"During the course of these few minutes, it was my understanding that we were going to immediately depart. There was some confusion for a couple of minutes about departure. I was not privy to that. And the President asked the two of us to sit with him, at which point he said that he was awaiting a judge who was en route to swear him in--that he had secured the advice of the Attorney General, which, as I understood it, was a preference in his view to have a swearing in ceremony immediately. And that this would be accomplished within a matter of minutes."*

O'Brien's subsequent words were more descriptive on this point. In his 1974 book *No Final Victories*, written after Johnson's death, O'Brien claimed that when he and O'Donnell first spoke with Johnson on the plane *"I told Johnson about the problem we'd had at the hospital and said I thought we should take off immediately. I knew that the delay was terribly painful to Jackie. 'No, I've talked with the Attorney General,' Johnson said. 'He thinks I should be sworn in here.' Then it hit me. This man is President of the United States. After that, I didn't argue."* Although a bit murky, O'Brien's words suggest that he'd actually explained to Johnson that further delay would be *"terribly painful to Jackie,"* and that Johnson had nevertheless responded by invoking Robert Kennedy as the authority indirectly causing her this pain. Hmmmm... If Johnson had really done this, and had lied to O'Brien about Kennedy's comments, well, he was indeed quite the weasel.

That Johnson had lied about what O'Donnell and Kennedy had told him, and had lined up the likes of Rufus Youngblood, Lem Johns, and John McCone as support for his lies, however, seems a very real possibility. One can only assume the Kennedys thought as much. They most certainly doubted Johnson's reasons for being on the plane in Dallas. In a **6-2-64** interview of Mrs. Kennedy, conducted by historian Arthur Schlesinger and finally released in 2011, she volunteered *"I don't know if Lyndon had an Air Force One just like it or one of the older planes, but he always kept pushing for a bigger plane. And--or for more--all the kind of things like that he wanted, the panoply that goes with power, but none of the responsibility."*

Mrs. Kennedy's words, one can only assume, stuck with Schlesinger. When one looks at June 1964 in his journal, published 2007, one finds that he talked about the flight back from Dallas with Air Force General Godfrey McHugh on **6-5-64**, and was told that neither Kenneth O'Donnell nor McHugh knew Johnson was on Air Force One when they arrived at the plane. McHugh told Schlesinger, furthermore, that, upon arrival on the plane, he'd initially been told the plane was being held until Mrs. Johnson's luggage could be brought over from the other plane, and not that they were waiting for Judge Hughes.

This, apparently, whet Schlesinger's appetite. His journal reflects further that he tried to talk about the flight with Mrs. Kennedy at a get-together on **6-16-64**, but was cut-off when a third party changed the subject.

This, then, brings us to Johnson's account of his actions. In his **7-10-64** statement to the Warren Commission, Johnson related: *"It was Ken O'Donnell who, at about 1:20 p.m., told us that the*

President had died. I think his precise words were, "He's gone." O'Donnell said that we should return to Washington and that we should take the President's plane for this purpose... When Mr. O'Donnell told us to get on the plane and go back to Washington, I asked about Mrs. Kennedy. O'Donnell told me that Mrs. Kennedy would not leave the hospital without the President's body, and urged again that we go ahead and take Air Force 1 and return to Washington. I did not want to go and leave Mrs. Kennedy in this situation. I said so, but I agreed that we would board the airplane and wait until Mrs. Kennedy and the President's body were brought aboard the plane... Despite my awareness of the reasons for Mr. O'Donnell's insistence--in which I think he was joined by one or more of the Secret Service agents--that we board the airplane, leave Dallas, and go to Washington without delay, I was determined that we would not return until Mrs. Kennedy was ready, and that we would carry the President's body back with us if she wanted... When we got to the airport, we proceeded to drive to the ramp leading into the plane, and we entered the plane. We were ushered into the private quarters of the President's plane. It didn't seem right for John Kennedy not to be there. I told someone that we preferred for Mrs. Kennedy to use these quarters. Shortly after we boarded the plane. I called Robert Kennedy, the President's brother and the Attorney General. I knew how grief-stricken he was, and I wanted to say something that would comfort him. Despite his shock, he discussed the practical problems at hand--problems of special urgency because we did not at that time have any information as to the motivation of the assassination or its possible implications. The Attorney General said that he would like to look into the matter of whether the oath of office as President should be administered to me immediately or after we returned to Washington, and that he would call back. I thereafter talked with McGeorge Bundy and Walter Jenkins, both of whom urged that the return to Washington should not be delayed. I told them I was waiting for Mrs. Kennedy and for the President's body to be placed on the plane, and would not return prior to that time. As I remember, our conversation was interrupted to allow the Attorney General to come back on the line. He said that the oath should be administered to me immediately, before taking off for Washington, and that it should be administered by a judicial officer of the United States. Shortly thereafter, the Deputy Attorney General, Mr. Katzenbach, dictated the form of oath to one of the secretaries aboard the plane. I thought of Sarah Hughes, an old friend who is judge of the U.S. district court in Dallas. We telephoned Judge Hughes' office. She was not there, but she returned the call in a few minutes and said she would be at the airplane in 10 minutes. I asked that arrangements be made to permit her to have access to the airplane. A few minutes later Mrs. Kennedy and the President's coffin arrived. Mrs. Johnson and I spoke to her. We tried to comfort her, but our words seemed inadequate. She went into the private quarters of the plane. I estimate that Mrs. Kennedy and the coffin arrived about a half hour after we entered the plane, just after 2 o'clock. About a half hour later, I asked someone to find out if Mrs. Kennedy would stand with us during the administration of the oath. Mrs. Johnson went back to be with her. Mrs. Kennedy came and stood with us during the moments that the oath was being administered. I shall never forget her bravery, nobility, and dignity. I'm told that the oath was administered at 2:40 p.m."

Let's note first that Johnson's statement is largely based on Marie Fehmer's notes. It repeats that Robert Kennedy called Johnson back to tell him the *"oath should be administered immediately."* It also claims Mrs. Kennedy arrived at the plane just after 2:00. That Johnson was willing to admit this last fact in his statement, moreover, supports that the Secret Service claim she arrived at 2:14 or 2:15 was, if not true, an innocent mistake, or at least not a lie pushed by Johnson.

Now note that Johnson stressed that, upon reaching the plane, he was ushered into the president's *"private quarters"* and that he told *"someone"* that *"we preferred for Mrs. Kennedy to use these quarters."* Well, this hid that Johnson turned around and used these *"private quarters"* to make a series of phone calls. And that's not all. While it's widely reported that Mrs. Kennedy spent the bulk of the flight in the back of the plane with her husband's casket and companions, the location of Mrs. Johnson on the flight back from Dallas is rarely discussed. In a 10-18-69 Oral History interview with the

Johnson Library, however, Johnson aide Jack Valenti was asked point blank her whereabouts on the flight back from Dallas, and admitted *"most of the time she was back in the little bedroom."* Apparently, the Johnsons' preference the private quarters be reserved for Mrs. Kennedy and Mrs. Kennedy alone was asking too much...of themselves.

Now note that Johnson and O'Donnell's stories were at odds on two key points. Johnson claimed that before he (Johnson) left Parkland Hospital for the airport he was told by Ken O'Donnell to fly back on *"the President's plane,"* which in this context would mean Kennedy's plane, number 26000. O'Donnell denied doing any such thing. Johnson then indicated that he (Johnson) had told O'Donnell at Parkland that he would wait for Mrs. Kennedy on *"the President's plane."* O'Donnell denied this as well.

Johnson's story was also at odds with Robert Kennedy's, of course. He claimed Kennedy told him the oath should be administered immediately in Dallas, while Kennedy--at least in Schlesinger's account--recalled no such thing.

Even so, the writers of the Warren Report--not surprisingly, in light of the fact their report was designed in part to clear Johnson--chose to take his word on these matters. In Chapter 2 of the report--a chapter written by Arlen Specter, then edited by Norman Redlich--it is claimed that O'Donnell told Johnson of Kennedy's death. It then relates: *"When consulted by the Vice President, O'Donnell advised him to go to the airfield immediately and return to Washington.²⁴⁵ It was decided that the Vice President should return on the Presidential plane rather than on the Vice-Presidential plane because it had better communication equipment.²⁴⁶"* The citation for footnote 245 reads *"Id. at 152; 7 H 451 (O'Donnell); 5 H 561 (Johnson)."* The claim is accurate and the citation is accurate. The citation for footnote 246, however, reads simply *"Ibid."* The Free Online Dictionary defines "Ibid" as *"In the same place. Used in footnotes and bibliographies to refer to the book, chapter, article, or page cited just before."* Note the words "just before." The page cited just before was a page from Johnson's statement. By placing a sentence in which O'Donnell *"advised"* Johnson before a sentence in which *"it was decided"* Johnson should return on the Presidential plane, the report had implied O'Donnell was a party to this decision. The writers of the report had thereby chosen to ignore O'Donnell's sworn testimony--the testimony they'd found credible enough to cite in the preceding footnote--and had decided to instead push the facts as related in Johnson's un-sworn statement. They'd then hidden this fact from the public.

It should come as no surprise then that they also accepted Johnson's word on the conversation he'd had with Robert Kennedy. The report claimed *"From the Presidential airplane, the Vice President telephoned Attorney General Robert F. Kennedy, who advised that Mr. Johnson take the Presidential oath of office before the plane left Dallas.²⁶³"* They, of course, never double-checked this with Kennedy.

As a result, the Johnson/O'Donnell and Johnson/Kennedy conflict on these matters was little recognized. It lay hidden beneath the surface of Washington politics.

Conclusion number 5: the Warren Commission was deceptive in its reporting of the aftermath of the assassination, and showed undue deference to Johnson's version of events.

The Kennedy Response

It bubbled up again, however, in **August 1966**, when William Manchester's book *The Death of a President* was being prepared for release. On **8-29-66**, Johnson and his close adviser Abe Fortas made a number of phone calls trying to get to the bottom of one of Manchester's more sensationalistic claims--that the Bible on which Johnson had taken the oath had belonged to Kennedy and had disappeared afterwards. Fortas uncovered that it was not a Bible, but a prayer book, and that it wasn't stolen, but placed into the White House archives. Even so, the phone calls, now available on youtube, do much to

damage Johnson's credibility. He mentions offhand that he thinks the bit about the Bible being stolen is part of a *"well-laid out deliberate thing"* designed to damage his presidency, and that the *"most serious aspect"* is that *"somebody working for us...had some knowledge of this"* and *"informed Manchester of this."* He then complained that the press covered the walk-out of a few students from a recent speech of his, and suggested that they must have been warned in advance, and that the whole thing was part of some much larger plot to discredit him. It's clear, moreover, whom Johnson thought was behind this plot: Robert Kennedy.

Was Johnson losing his grip? Or was he merely admitting what he'd long decided was true--that Bobby was out to get him? And, more to the point, was Johnson's paranoia the product of a guilty conscience?

In anticipation of the release of Manchester's book, U.S. News and World Report published its own account of the shooting on **11-14-66**. This was based almost entirely on the 26 volumes of Warren Commission testimony and exhibits published in 1964. There was one interesting addition, however. The writers of the article had either stumbled upon, or been warned of, the Johnson-Youngblood and O'Donnell divide, as to whether O'Donnell had told Johnson he should fly back on Air Force One, and if the plane had in fact had a superior communications capability to the other planes in the president's fleet. To no one's surprise, they came down on the side of Johnson.

Here's why: *"A former White House official explained that, at the time, the three jet planes in the presidential fleet were being 're-gear'd for communications of a classified nature, Naturally, the first plane to be re-equipped was AF-1. Most of the new gear had been installed in AF-1. The other two jet planes had not been completed. Now they all have the same gear, so it doesn't make any difference any more, whether a President travels in AF-1, 2 or 3."*

Well, that was mighty convenient, don't you think? An unnamed former White House official told them AF-1 just so happened to have been superior to AF-2 during the day in question? And the exact way in which it was better is classified? And they believed it? To such an extent, even, that they were willing to suggest O'Donnell had lied to the Warren Commission?

Manchester himself was more subtle in his bias. After first reporting that Johnson claimed O'Donnell had told him to take Air Force One, Manchester wrote: *"O'Donnell declares this version to be 'absolutely, totally, and unequivocally wrong.' He says that Johnson raised the possibility of a conspiracy and that 'I agreed that he should get out of there as soon as possible.' Then, he recalls, 'He asked me whether they should move the plane--meaning, I thought, Air Force Two--to Carswell Air Force Base. I said no; it was 35 miles to the Air Force base, and it would take too long to move the plane. Besides, no one would know that he was going from Parkland Hospital to Love Field anyway; they had no way of knowing.' Concerning 26000, O'Donnell says, 'The President and I had no conversation regarding Air Force One. If we had known that he was going on Air Force One, we would have taken Air Force Two. One plane was just like another.'" Manchester then concluded: "The discrepancy between the two versions" (that of O'Donnell and of Johnson) *"is probably a consequence of confusion."* He also offered that Johnson *"may have had...thoughts about the value of identifying himself with what he called the 'aura of Kennedy,"* and to have decided that it was in his best interests, politically, that he return to Washington with the President's widow at his side.*

The "discrepancy" between Robert Kennedy and Johnson on the swearing-in also saw light at this time. Manchester wrote that the substance of Kennedy's return phone call to Johnson was unclear, that Johnson thought it was about whether he should take the oath, and Kennedy thought it was about who could give the oath. He wrote as well that Johnson told the Warren Commission Kennedy told him to take the oath, and that, on this issue *"Youngblood's memory is foggy. He tends to support his superior, with qualifications, but he explains--quite reasonably--that he only heard one voice. Kennedy who was on the other end, does not remember recommending an immediate ceremony, and it should be noted*

that such a recommendation would have been inconsistent with his mood. It is his recollection--and that of Ed Guthman, who was with him, that he said 'Anybody can swear you in. Maybe you'd like to have one of the judges down there whom you appointed. Any one of them can do it.'" (Note: Manchester interviewed Guthman on 3-24-64, 5-3-64 and 6-10-64, Kennedy on 5-14-64 and 1-12-65, and Youngblood on 11-17-64. The notes and/or transcripts of these interviews are not yet available.)

It should be noted that Kennedy was playing it cool here. He had Ed Guthman as a witness that he'd never told Johnson he should be sworn in in Dallas, and yet still refrained from calling Johnson a liar. Perhaps, then, Manchester had told Kennedy of his interview with McCone, and McCone's insistence Kennedy had indeed told Johnson he should be sworn in. One might assume from this as well that Manchester covered this topic in his first interview with Kennedy, at a time Kennedy was still functioning as Johnson's Attorney General, and still hoping for a slot on the Democratic ticket as Johnson's Vice President. When Kennedy was interviewed by Schlesinger the next year, we should recall, he was much more forthcoming.

Manchester, for his part, didn't stop there, either. Not only did he not tell his readers of McCone's recollections, he later wrote that Kennedy's disavowal of telling Johnson to take the oath was *"supported by Kennedy's opening words to Katzenbach: 'Lyndon wants to be sworn in in Dallas.'*" (Note: Manchester interviewed Katzenbach on 6-5-64)

Manchester returned to this topic later in his book, for that matter, and made sure the reader knew where both Kennedy and he stood on the matter. Of Robert Kennedy and Jacqueline Kennedy's first conversation after she'd landed in Washington, he wrote: *"a disjointed conversation ensued, touching upon the probable future of Kennedy aides, the delayed take-off from Love Field...and the explanation which the new President had offered at the time. 'He said he'd talked to you, Bobby,' Jackie told her brother-in-law, 'and that you'd said he had to be sworn in right there in Dallas.' The Attorney General was startled. There must be some misunderstanding, he said: he had made no such suggestion."* In a footnote, Manchester then offered *"The author invited President Johnson to comment on this misapprehension. He replied that he had nothing to add to his statement to the Warren Commission."* (Note: beyond his interviews with Robert Kennedy, in which this conversation between Jacqueline and Robert Kennedy was undoubtedly discussed, Manchester interviewed Mrs. Kennedy on 4-7-64, 5-4-64, 5-7-64, 5-8-64, and 7-20-64. The notes and/or transcripts of these interviews are, you guess it, not yet available.)

Manchester's interviews with Mrs. Kennedy, of course, were not confined to discussion of the swearing-in. In fact, when one studies the events of 11-22-63 closely, one finds that they revealed something far worse than Johnson's misunderstanding or lying about Robert Kennedy's attitude towards the swearing-in. In his book, Manchester relates that, after arriving on Air Force One, Mrs. Kennedy headed for the bedroom. He reports that *"Because she regarded the bedroom as hers, she did not knock. She simply grasped the latch and twisted it. Inside, reclining on the bed, was Lyndon Johnson, dictating to Marie Fehmer."* Manchester then reported that Johnson and Fehmer quickly left the room, and that Kennedy aide Lawrence F. O'Brien was a witness to their doing so. (Manchester interviewed O'Brien on 5-4-64 and 6-4-64.)

Well, yikes! Why hadn't this been mentioned before? Let's recall that Johnson had told the Warren Commission, that, upon arrival at the plane, *"We were ushered into the private quarters of the President's plane. It didn't seem right for John Kennedy not to be there. I told someone that we preferred for Mrs. Kennedy to use these quarters. Shortly after we boarded the plane. I called Robert Kennedy, the President's brother and the Attorney General."* Hmmm... Johnson failed to mention that he'd made this call from the private quarters. Of course that could have been an oversight... But that's just the half of it. In his statement to the Warren Commission, Johnson proceeded to describe his discussions with Robert Kennedy, and his decision to have Sarah Hughes perform his swearing-in

ceremony. He then asserted that a few minutes after talking to Hughes *"Mrs. Kennedy and the President's coffin arrived. Mrs. Johnson and I spoke to her. We tried to comfort her, but our words seemed inadequate. She went into the private quarters of the plane."*

He'd totally concealed that he'd been using the private quarters of the plane, and had been caught in the act by Mrs. Kennedy! He'd made it seem, moreover, that he'd avoided using these quarters out of respect for her late husband!

Conclusion number 6: Johnson lied about the first time he saw Mrs. Kennedy on the plane.

Through December 1966, Johnson had largely had his say. His time had passed. Now the Kennedys were having theirs...

Led by Kenneth O'Donnell... When interviewed for a **12-6-66** AP article (found in the Spokane Daily Chronicle), O'Donnell sought to clarify Manchester's claim Johnson had over-ruled him (O'Donnell) after he (O'Donnell)--not having been told the plane was set to be the site of Johnson's swearing-in ceremony--had ordered Air Force One to take off. O'Donnell explained that upon arrival at Air Force One *"I didn't know that he (Johnson) was on the plane. I was under the impression he had already left."* If he'd been told Johnson would wait for Mrs. Kennedy on Kennedy's plane, as Johnson insisted, O'Donnell would never have made that impression.

O'Donnell had thereby signaled that he wasn't about to back down. Johnson had not told him he would wait for Mrs. Kennedy. Period... This reflected badly on Johnson, and supported Manchester's supposition he'd orchestrated his return flight to Washington for political reasons.

Other articles fanned the flames. A UPI article on Mrs. Kennedy's efforts to further edit Manchester's book (found in the **12-16-66** Washington Reporter) relates: *"Bennett Cerf, the publisher and television panelist, said Thursday that Mrs. Kennedy is sensitive to a passage describing Lyndon B. Johnson's taking over the presidential plane after Kennedy was shot in Dallas. Cerf, who said he wishes his Random House was publishing Manchester's book, read an unedited version of the manuscript and described it as 'a wonderful book which will sell a million copies.' Cerf said that the book relates that the presidential jet--Air Force One--and the vice-presidential jet were at Love Field in Dallas Nov. 22, 1963. The planes were identical--except for the 'football,' a bag containing information regarding procedures in case of nuclear attack. The book, according to Cerf, says the Kennedys were 'shocked and infuriated' when they returned to Air Force One with Kennedy's coffin and found Johnson occupying the presidential jet."*

The Johnson Counter-attack

This demanded a response. On 12-16-66, one of Johnson's advisers, Robert Kintner, a former news executive for ABC and NBC, proposed that they plant an article telling Johnson's side of the story in either Time or Newsweek.

On **12-17-66**, Johnson snapped. In a taped phone call, he discussed the Manchester book with his most secret and trusted adviser, Supreme Court Justice Abe Fortas. At one point, Johnson asked *"Who is the perpetrator of the fraud on us, Kenny O'Donnell, or General McHugh, or who?"* Fortas then answered *"Both. Those two... it's pretty obvious that those are the two villains."* At another point they discussed Manchester's treatment of the disagreement between Johnson and Robert Kennedy on whether or not Kennedy had told Johnson he should be sworn in in Texas. Johnson complained *"there's also an implication that Bobby didn't want us to take the oath, when the implication to me was that he thought it better to take it there. And that he would have somebody call me and give me the oath."* Well, I'll be. Johnson had as much as admitted to Fortas that Bobby had never told him to take the oath--and that

he'd only implied as much.

And that's just the beginning. At a later point, Johnson went on a tirade about the book being but a slender part of a wider conspiracy: *"I believe that Bobby is having his governors jump on me, and he's having his mayors, and he's having his Negroes, and he's having his Catholics... and he's having 'em just, systematically, one after the other, each day. And I think this book is just... I believe that each one of these things are timed."* A bit later, he went even further. Aware that one of the issues at hand was the length of time he'd made Mrs. Kennedy wait on the plane, he asked Fortas *"What does the evidence show about how long she waited? I was under the impression we waited for her."* Fortas then responded *"there was just under half an hour between the time that she arrived, and the time that the plane took off."* Well, this would suggest he bought into the Secret Service timeline, and not the timeline suggested by Marie Fehmer's notes. A few seconds later, however, Fortas further confused this issue. He told Johnson: *"Judge Hughes came about ten minutes later. And the takeoff was about fifty minutes after Mrs. Kennedy came aboard."* Well, yikes. Fortas was now pushing the Fehmer timeline, and not that of the Secret Service. But wait, it gets weirder. He then continued *"I had the impression it was the other way, I guess, because of what you told me. But this morning we checked the log... so she did have to wait awhile before Judge Hughes could come and before the plane could take off."* Well, double yikes. This suggests that Johnson had been telling those close to him that Mrs. Kennedy had arrived after Judge Hughes, and not before. Could his memory have really been that bad? Or was he simply willing to lie about anything?

The recollections of Congressman Jack Brooks, who'd waited with the Johnsons at Parkland, and returned to Washington with them on Air Force One, become relevant at this point. Brooks made some comments to Marie Fehmer while still aboard Air Force One. (Fehmer's notes on these comments, as Fehmer's notes on Johnson's actions, can be found on the Johnson Library website.) About Johnson's decision to leave Parkland, Brooks said merely that, after being told by the Secret Service that Kennedy had expired, and urged to *"leave now,"* Johnson *"thought he should not do that until they got a medical determination rather than a non-professional comment."* When interviewed for the Johnson Library on 2-1-71, moreover, Brooks once again said nothing of Johnson's deciding, while still at Parkland, that he would wait for Mrs. Kennedy and the body when he got to the plane. Instead, when asked if Johnson was committed to the suggestion he be sworn in on the airplane when Brooks first raised the issue, Brooks claimed: *"He hadn't been committed to anything, he had just got there! The question hadn't come up. He agreed that that was the thing he ought to do. They got hold of Sarah Hughes and Sarah came out. We were waiting, of course, until Mrs. Kennedy, who wanted to ride back with us apparently, and the coffin."*

Hmmm... How did Brooks come to believe it was Mrs. Kennedy's desire she ride back with Johnson? There's no evidence she was ever asked about this. Was this something Johnson had told Brooks?

And why did Brooks make it sound as though Mrs. Kennedy had arrived after Hughes? Was this something he'd come to believe, over time? Or was this something Johnson had told him, as well as Fortas?

In any event, Johnson's being told by Fortas that he would have to concede this point--that his decision to be sworn in in Dallas had indeed inconvenienced Mrs. Kennedy--was not readily accepted. He began grasping at straws... He asked Fortas: *"Is that gonna react on us or on them? That the president shouldn't be on the plane where the black bag is and where the communications is, and he should have gone on and taken off without takin' the oath?"*

This was balderdash, of course, and bald-faced balderdash at that. The "bag," or "football," was a briefcase containing the nuclear launch codes. It was carried by an officer in the Signal Corps named Ira Gearhart. It was not on Air Force One. It was portable, and was designed to follow the President

wherever he went. Johnson knew this, of course. He almost certainly knew as well that the bag could be used on his plane as easily as it could be used on Kennedy's plane. If he was so concerned about Gearhart and the bag when he left for the airport, for that matter, why did he leave without Gearhart, and force Gearhart to find his own way to the airport?

On **12-20-66**, Johnson discussed the matter further, this time with Robert Kintner. Kintner told him that he'd had a talk with Mike Cowles, the publisher of Look Magazine, which was preparing to syndicate excerpts from Manchester's book. Kintner reported that *"Bobby Kennedy does not agree that he told you to be sworn in on Air Force One,"* but that, on the brighter side, Cowles claimed to have cut 90% of the material harmful to Johnson from the upcoming excerpts. According to Kintner, Cowles also offered to let Kintner come by and read the excerpts in secret. This, presumably, calmed Johnson down a bit just in time for Christmas.

On **12-26-66**, however, he got reheated. Press Secretary Bill Moyers had received a copy of the **January 2, 1967** issue of Newsweek. An article in this issue on the upcoming Manchester book relates: *"Mr. Johnson's own recollection of his succession to power differs sharply from the Kennedys' evident perception of it. The Secret Service, he recalled, wanted to put him aboard Air Force One with its superior communications gear and to place Mr. Kennedy's coffin on the Vice Presidential plane, Air Force Two, which had flown LBJ to Texas. But Mr. Johnson ordered the body put aboard Air Force One. 'I wasn't going to let Mrs. Kennedy fly back alone with his body,' he explained to intimates."*

Hmmm... This story was not only different from O'Donnell's recollections, it was different from Johnson's previous statements to the Warren Commission. To all appearances, Johnson was now trying to blame the Secret Service for his decision to fly back on Air Force One--a decision he'd previously attributed to O'Donnell.

As to the other main point of contention--whether or not Robert Kennedy had told Johnson he should be sworn in in Dallas--Johnson appeared to stand firm. Newsweek reported: *"He recalls telephoning Bobby (I hate to bother you at a time like this, but') and asking for a ruling. Kennedy, he said, told him 'I think you should be sworn in there,' but Bobby also said he would check it and call back. The return call came instead from then Deputy Attorney General Nicholas DeB Katzenbach, who advised Mr. Johnson to take the presidential oath at once and dictated its wording to a Johnson secretary."*

Now, let's look at that again, in slo-mo. Johnson had told the Warren Commission, that after initially talking to Kennedy, *"I thereafter talked with McGeorge Bundy and Walter Jenkins, both of whom urged that the return to Washington should not be delayed. I told them I was waiting for Mrs. Kennedy and for the President's body to be placed on the plane, and would not return prior to that time. As I remember, our conversation was interrupted to allow the Attorney General to come back on the line. He said that the oath should be administered to me immediately, before taking off for Washington, and that it should be administered by a judicial officer of the United States. Shortly thereafter, the Deputy Attorney General, Mr. Katzenbach, dictated the form of oath to one of the secretaries aboard the plane."* Hmmm... He was thereby claiming Kennedy had told him in a brief second conversation that he should be sworn in in Dallas. His story had changed. He was now telling people Kennedy had told him in their first and only conversation that he should be sworn in in Dallas. While he may have simply forgotten about the second conversation, it doesn't say much for Johnson's credibility that he couldn't even keep his story straight.

If it was even his story... The tape of the phone call between Moyers and Johnson on 12-26 reveals that Moyers had called Charles Roberts of Newsweek and complained that, despite Newsweek's representations, Johnson had not actually spoken to Newsweek for the article. According to Moyers, Roberts freely admitted that they had not spoken to Johnson, but claimed *"I talked to people to whom the President talked, and I'm confident of the information that we received."* Johnson then told Moyers

"I think we better write a nice paragraph and say, I've had no interviews on the subject at all. And this is completely inaccurate, and untrue, and unfair...that I've asked my staff not to discuss it. And ask 'em to publish it..." Johnson had thereby indicated his dissatisfaction with the article.

He was unhappy with the article and he wanted everyone to know about it. Johnson Press Secretary George Christian spoke about the article hours later, and his comments were picked up in the evening papers. A 12-26-66 UPI article found in the Eugene Register quotes Christian as follows: *"The President has granted no interviews to anyone including Mr. Manchester and has asked his staff to refrain from discussing the subject--the entire subject of the book...He did not talk to Newsweek."* The article then quotes what would appear to be an official statement by Johnson: *"I'll not discuss the various attributions credited to so-called friends and alleged intimates except to say that I believe them to be inaccurate and untrue."*

And yet...there's reason to believe Johnson was bluffing. Over the course of their long and winding phone call, Johnson and Moyers came to agree that the writers of the article hadn't just made stuff up, and that a number of those close to Johnson had in fact spoon-fed them the article. While several segments of the article were misleading and inaccurate, it seems more than a coincidence that, but 10 days before Moyers' called Johnson to complain about an article telling Johnson's side in Newsweek, Robert Kintner had suggested the administration plant a story in Newsweek.

And that was but one of the coincidences. It also seems more than a coincidence that the claim in the article that Johnson was pressured to fly back on Air Force One, due to its superior communications, was something Johnson had just told Fortas. And it's also a bit odd that, while it was Moyers who'd called Johnson to tell him about the article, it was Johnson who told Moyers several minutes into their discussion that Charles Roberts' co-writer on the article was a woman named Norma Milligan, and that she'd flown in from Oklahoma to work on the article. And it also seems odd that, a short time after completing his call with Johnson, Moyers called him back to tell him he'd just spoken to Fortas, and that Fortas had said that Johnson should be *"careful"* in his complaining about the article because *"most of it is good for our side,"* and that *"it makes you look good, even if it is based upon an inaccurate thing."* This, then, led Moyers and Johnson into a discussion of the problems inherent with too many people thinking they know the President's thoughts, and their sharing these thoughts with hungry journalists, desperate for an inside scoop. At one point, Johnson even admits *"i would imagine it's (Washington insider and Johnson adviser) Clark Clifford, or Abe, or somebody that just had these feelings."*

The probability, then, is that the article was indeed fed Newsweek by Johnson's people, with Johnson's approval, but behind Moyers' back. While historian Max Holland, for one, takes Johnson's complaints about the article, and Johnson's professed desire to stay above the fray, seriously, it seems more likely Johnson was lying through his teeth to Moyers, at one time one of his most trusted assistants, but by December 1966 a no-longer entirely trusted lame duck leaving the Administration.

Johnson's problem with telling the truth, after all, is more than apparent when one studies his phone calls. At one point in this call, Johnson reads sections of the Newsweek article to Moyers, and complains about each section. When he comes to the section on the oath of office, and reads *"I think you should be sworn in there," Bobby said,*" he complains *"I don't think Bobby said that at all. I don't think Bobby took any initiative or any direction. I think that Bobby agreed that it would be all right to be sworn in, and said he wanted to look into it, and he would get back to me, which he did."*

Oops. Let's recall that Johnson had complained to Fortas on the 17th that *"there's also an implication that Bobby didn't want us to take the oath, when the implication to me was that he thought it better to take it there. And that he would have somebody call me and give me the oath."* Johnson had thereby indicated that Kennedy had never actually told him to take the oath. Now, in this call with Moyers, he

confirmed that Kennedy had never specified such a thing. And yet, Johnson had told the Warren Commission on 7-10-64 that Kennedy had *"said that the oath should be administered to me immediately, before taking off for Washington."* And yet, Jackie Kennedy had told William Manchester in early '64 that Johnson had told her on the plane that Kennedy had *"said he had to be sworn in right there in Dallas."* And yet, Marie Fehmer's notes from 11-22-63, typed up on the plane en route to Washington, reflect that Johnson had told her that he'd just been talking to Walter Jenkins, and that *"The Attorney General interrupted the conversation to say that I ought to have a judicial officer administer the oath here."* And yes, she put this in quotes, indicating it was a direct quote from Johnson.

Johnson had been telling people from day one that Robert Kennedy had specifically told him he should be sworn in in Dallas, and was now admitting to his advisers, in phone calls he'd never dreamed would become available to the public, that Robert Kennedy had done no such thing!

Hmmm... This makes McCone's claim to Manchester--that he'd overheard Kennedy tell Johnson he should be sworn in immediately--even more curious, yes?

Conclusion number 7: Johnson lied both on the plane, and afterwards, about the substance of his call with Robert Kennedy.

The Rorschach Blot As Seen By Victor Lasky

The Kennedy/Johnson divide over what happened on the plane was by now the talk of the nation. On 12-26-66, newspaper columnist Victor Lasky wrote a column on the feud (which I found in the Youngstown Vindicator), which could only have fanned the flames. No fan of the Kennedys, or of Johnson, Lasky defended Johnson from the beginning of his column--not so subtly entitled "The Way LBJ Took Reins is Among His Finest Hours"--to the end. He started out by claiming the Kennedys' disapproval of Johnson had long been apparent. He then wrote: *"Now it turns out that Mrs. Kennedy gave author Manchester a highly emotional account of what transpired aboard Air Force One shortly after the assassination. As she apparently told the story, Lyndon Johnson was boorishly insensitive to her feelings at her time of supreme trial. Among other things, she resented Mr. Johnson's appropriation of Air Force One and his insistence that she be present when he was sworn in as President. The truth is that it was the Secret Service that made the crucial decision for Johnson to fly back to Washington immediately, and it was the Secret Service that rushed him--in an unmarked car--to Air Force One. At the time, no one really knew what lay behind the assassination. The fact that the alleged assassin was known to be some sort of communist, a defector to the Soviet Union, led to the fear that the Russians might have decided to attack this country. It was Johnson himself who decided that he take the oath as President, believing--and very wisely--that in a time of such grave emergency the nation should not be leaderless."* Lasky then proceeded to claim *"If anything, it was Kenneth O'Donnell, the late President's appointments secretary, who acted boorishly on Air Force One...He actually barred the way to prevent the new President from accompanying the widow as she left the plane with the coffin."* He then offered: *"My information, obtained for a new book on Robert F. Kennedy, suggests that Johnson acted with great restraint and dignity. The manner in which he assumed leadership may well go down in history as one of his finest hours. The memory of those tragic days should not be sullied by the hysterical recollections of Mrs. Kennedy and O'Donnell...The fact remains, too, that no matter what she might have believed later, Mrs. Kennedy apparently had thought differently a month after the assassination. Then Mrs. Kennedy, in praising the new President for his behavior toward her, sent him a gift that 'Jack would have wanted you to have.'"*

This column is intriguing for a number of reasons. First, it followed Johnson's most recent lead and blamed the Secret Service for Johnson taking Kennedy's plane. Second, it acknowledged it was

Johnson's decision to be sworn in Dallas. Third, it grossly disguised the circumstances under which Johnson decided to be sworn in; Johnson knew nothing of Oswald or his background when he decided to take the oath in Dallas, and his suggestions to Robert Kennedy and others that he thought a foreign power may have been behind the shooting--when the clear LOGICAL assumption under the circumstances was that it was a domestic hit--is surprising, if not downright suspicious. Fourth, it was grossly insulting to Mrs. Kennedy; it points out that she gave an *"emotional account"* to Manchester, and later describes her recollections as *"hysterical."* The clear intent, then, is to paint her as a weak and silly woman lacking in credibility. This is reinforced in the last sentence of the column, in which Mrs. Kennedy's private words to Johnson are quoted. This quote could only have come from someone close to Johnson. Thus, through his words, Lasky had showed his cards. His column was an attack piece, almost certainly fed him by the same people behind the article in Newsweek. It was also a threat--it signaled to the Kennedys that Johnson was willing to use Mrs. Kennedy's letters to discredit her.

On **12-28-66**, Jake Jacobsen, a Johnson assistant tasked with reading through a draft of Manchester's book, identifying potential problems, and double-checking details, received a memo from the White House Communications Agency detailing Robert Kennedy's phone calls on 11-22-63. This memo established that Johnson called Kennedy at 1:56 CST, and that Kennedy called Johnson back at 2:02 CST. This information was never leaked to the public.

We can only guess why. Marie Fehmer's notes show that Hughes called in at 2:02. They also show that her office was first contacted a few minutes earlier. If Kennedy had told Johnson he should be sworn in during their second phone call, as Johnson claimed in his initial statement, and this was at 2:02, as purported by the White House Communications Office, it meant that Johnson called Sarah Hughes to ask her to swear him in before Robert Kennedy had ever told him he should be sworn in in Dallas.

It's even worse than that. Let's recall that Fehmer's notes reflect that the oath of office was administered at 2:40, while the watches of the reporters in attendance reflect that it took place at 2:37 or 2:38. This suggests that the watch or clock she was using for guidance was a few minutes fast. The times for the calls on the White House Communications Office memo received by Jacobsen are presumably accurate. It seems probable, then, that Judge Hughes said she was on her way at 2:00, 2 minutes before Robert Kennedy called Johnson back, and supposedly told him he should be sworn in.

This is at odds, however, with Fehmer's notes. They quote Johnson talking about his phone call to Robert Kennedy before they mention Judge Hughes' calling in and saying she'd be there in 10 minutes.

Perhaps, then, the times on her notes were just wrong... Perhaps Johnson was trying to hide that it took so long to find Hughes, and had asked Fehmer to claim Hughes called him back at 2:02, when she'd really called back at 2:14, just as Mrs. Kennedy was pulling up outside. Now, that would explain not only the discrepancy between Fehmer's notes and the White House Communications Agency on the timing of the phone calls, but the discrepancy between Fehmer's notes and the Secret Service on the timing of Mrs. Kennedy's arrival on the plane. Perhaps the two "2:02's" provided in her type-written notes were supposed to read "2:14," or even later.

Only adding to the possibility Judge Hughes called back within a few minutes of 2:00, however, is a brief quote attributed to pilot James Swindal in the 11-20-88 Dallas Morning News. According to Swindal, *"It took quite a little bit"* of time for Judge Hughes to reach the plane. If she'd called Johnson back at 2:18, or even 2:14, and arrived at 2:30--after telling Johnson she'd be there in 10 minutes--it seems unlikely Swindal would complain in such a manner. It seems more probable, then, that she called in much earlier, shortly after 2:00 (2:02 by Fehmer's watch), and was incredibly slow in arriving.

No matter what--whether Hughes called in at 2:00 or 2:14--however, the list of calls provided Jacobsen presented a new problem for Johnson. By his account, he called Robert Kennedy within a few minutes of reaching the plane. By most accounts, including Fehmer's notes, he reached the plane at 1:40, or

earlier. So what did Johnson do for 16 minutes or more, after reaching the plane, but before calling Kennedy? Did he sit there watching TV with Congressmen Jack Brooks, Homer Thornberry, and Albert Thomas, discussing his next move? Really? For 16 minutes or more? While he was purportedly scared that a conspiracy was afoot? While the Secret Service was begging him to leave?

I suspect not. I suspect that Johnson, in fact, decided to be sworn in in Dallas within a few minutes of his arrival on the plane. I suspect that he then called Hughes, in an effort to get her to come out and swear him in. Only he couldn't find her. I suspect that he then, and only then, decided to call Robert Kennedy, and get some political cover for his decision to be sworn in in Dallas.

This isn't as wild as one might first suspect. When interviewed for the Johnson Library on 10-7-68, Judge Hughes described her conversation with Johnson in the following manner: *"The first call was by an aide of the Vice-President, and my law clerk had answered the phone, and he had said that he didn't know where I was. Immediately after he hung up, the phone rang again and it was the Vice-President. He told John Spinuzzi, who was my law clerk--said that he wanted to find me, and John says, 'Well, we'll find her.' Just at that time Barefoot came in the office and at that time the phone rang and I was on the other end of the line."* It seems likely, moreover, that she told this same story to William Manchester when interviewed by him on 9-19-64.

Now, that sounds well and good. It all went bang-bang-bang in a couple of minutes. But Judge Hughes wasn't there when the first call came in. And who's this "Barefoot?"

"Barefoot" was Barefoot Sanders, the U.S. Attorney in Dallas. He'd been in the motorcade, and had reported for work, compiling lists of right-wing suspects, after realizing the President had been shot. On 3-24-69, he was interviewed for the Johnson Library, and claimed that he was called at work by a friend of Johnson's named Irving Goldberg. He added *"I think I told Irving I was going to locate Judge Hughes. I went up to her office; she could not be found and when I was up there, a call came in--a call came in to me downstairs from the plane. I don't know who it was; it was not the Vice-President. 'Can you find her?'" Irving and I talked about it. I went tearing upstairs to her office. She was not there. When I got up there...I was on the third floor; she was on the fourth. And when I got up there, which must not have been forty seconds, the phone was ringing and it was the plane trying to reach her. And I said 'I'll try to get her.' So then I got her on the other phone, and I gave that agent--whoever it was-- to one of the secretaries there, and I reached her at home and asked her to get on out there."* Sanders was interviewed by Manchester on 9-22-64, 9-26-64, and 5-27-65, and apparently told a similar story. Similar, but not identical. In Manchester's book, and Judge Hughes' account with the Johnson Library, she calls in by pure chance just as Sanders comes into her office, and Sanders is handed the phone.

Hmmm... So Judge Hughes thought she'd called in, and just so happened to call when Sanders was in her office trying to find her, and Sanders later claimed he'd actually tracked her down. Well, that could be an honest conflict of memories. More interesting, by far, is Sanders' recollection Goldberg asked Sanders to find Judge Hughes before Sanders ever spoke to Fehmer, or Valenti, or whoever called him from the plane. This suggests that someone--perhaps Johnson--had called Goldberg first, and asked him to find Hughes. And this suggests, in turn, that it wasn't such a bang-bang-bang operation after all...

So what about Goldberg? Did he confirm he'd been called by Johnson?

Yep. Goldberg was interviewed by Manchester on 9-24-64. Note that this is 5 days after Manchester first spoke to Hughes, and 2 days after he first spoke to Sanders. It follows then that Hughes led Manchester to Sanders and Sanders led Manchester to Goldberg. He must have felt he was really onto something. Johnson hadn't mentioned Sanders or Goldberg to the Warren Commission. He'd made it seem as if he called Robert Kennedy seeking advice on the swearing-in, that Robert Kennedy called him back a few minutes later telling he needed to be sworn in, that he then and only then called

Hughes' office, and that she returned his call a few minutes later. If that was the way it all went down, however, why did Johnson even call Goldberg?

Manchester provides some help on this question. He presents that after getting off the phone with Robert Kennedy, Johnson had Fehmer call Mrs. Johnson's lawyer, J.W. Bullion, only to find that he was out of town. He says that he then asked her to *"Get Sarah Hughes,"* and that when that effort failed, he told her to *"Try Irv Goldberg."* Well, let's note right here that Bullion and Goldberg were lawyers, not Judges. They couldn't swear him in, they could only offer advice. Now, does it make a lot of sense for us to believe he'd reached out for their advice after talking to the Attorney General, and being told he needed to be sworn in? Of course not.

Now, if he'd had any reason to believe Bullion or Goldberg had an inside track on Hughes' whereabouts, that would be one thing. But, as presented by Manchester, Johnson never asked Goldberg about Hughes's whereabouts. Instead, he quoted Johnson as asking Goldberg *"This is Lyndon. Do you think I should be sworn in here or in Washington?"* and Goldberg as responding *"I think here."* He then quoted Johnson as asking *"Who should do it?"* and Goldberg answering *"Sarah Hughes."* He then quoted Johnson as telling Goldberg *"We're trying to get her here. You try, too."* And then described Goldberg's decision to call Sanders. That's it. Goldberg had no inside track on Hughes. And Johnson knew it. He'd called Goldberg for advice, pure and simple.

And he even admitted this to Manchester. While Johnson refused to grant Manchester an interview, he did respond to some written questions on 6-24-65. Apparently, some of these were on his contact with Goldberg. While Johnson's answers are apparently still unavailable, Manchester does quote a few of them in his book. In a footnote regarding Goldberg's claim he told Johnson *"I think here,"* to be clear, Manchester cites that Johnson in his written statement claimed Goldberg had been more definitive, and had *"advised"* him *"he should be 'sworn in at once, and undertook to locate Judge Sarah Hughes to administer the oath.'"*

Well, if Robert Kennedy had already told Johnson he'd look into this question, and had called him back insisting that he needed to be sworn in immediately--before leaving Dallas--would Johnson waste precious minutes seeking further advice? I think not.

That Johnson had called Goldberg before talking to Kennedy becomes even more clear when one reads Goldberg's subsequent statements. Goldberg was interviewed for the Johnson Library on 11-2-69. There, he said he'd been at the Trade Mart with his wife awaiting the President's arrival, and had just been informed of the shooting. He then recalled *"I said, 'Well, Marian, let's get on out of here as quickly as we can.' So we went to the car and I said, 'I'm going home. I'm not going to go on.' So I went home. When I got in the house, I immediately went upstairs and flipped on the TV. I was in the contour lounge. I turned it on and the picture had not even come on. I just turned it, hadn't gotten a picture, and the phone rang and it was my office, my switchboard operator says that the Dallas White House is trying to get you. I said, 'Well, we better hang up.' So I hung up and the phone rang within seconds. I heard, 'Is this Irving Goldberg?' I said 'Yes.' 'Well, this is the Dallas White House. Hold the phone.' Well, I held the phone, I kept hearing a lot of noise, booping and beeping around, I didn't know what it was. I hung on for about a minute, and I hung up. I thought maybe we missed connection. I didn't know what to do. Electronics is something I don't understand at all...Sure enough the phone rang again and the same voice says 'Would you please hold the phone?' Maybe they had to do something, I don't know. Anyway, I held this time and pretty soon--it wasn't too long really--a voice says, 'This is Lyndon.' He said, 'Irving, I want to talk to you. I want to ask some questions awful fast. I need some quick opinions.' I said, 'I'll do my best.' He said, 'First, should I take the oath here or go to Washington?' I said 'Take it here.' He said, 'Who should give the oath?' I said, 'Mr. President, you are now the president of the United States, in my opinion, by constitutional devolution, but I could be wrong. I would take the oath,*

though I think you are now the president.' He said, 'Who can give the oath?' I said, 'Well to be perfectly blunt, a notary public could give it, anyone that can take an oath. But I suggest that you have a federal judge.' I was not a judge, of course. 'I would have a judge.' He said, 'Well, who do you have in mind? Do you have anyone in mind?' And I said, 'I would have Sarah Hughes.' He said, 'I think that is excellent. Everything you said I agree with.' Then he said the strangest thing. He said, 'Will you try to get her for me?' To me, the President of the United States asking me sitting in my home, well this doesn't make [sense]. I said, 'Well, Mr. President'...I said 'Mr. President of course I'll try to get her, and I am sure you are going to try to get her. By the way, you haven't told me where you are.' He says, 'I'm at Love Field in Air Force One.' And I said, 'I'll work on it and you work on it.' We hung up and I thought for about a second or two, half a minute, what to do. Then it hit me. So I called Barefoot and luck was with me. I knew his secretary. I said, 'This is Irving Goldberg. I don't want any preliminaries. I want Barefoot now.' She said, 'He is here,' and put him on for me. I said, 'Barefoot, no time for conversation, listen to me and act. The President is at Air Force One. He wants Sarah Hughes to swear him in. You find her. Use the FBI, use the Secret Service, use the Chief of Police, you know who to use. I don't know who to use. You get her there.' So he hung up, and he tells me he ran down to her floor. Well, anyway he went to her office and she happened to be on the phone talking to her secretary when he walked in her office, so he was able to tell her exactly what to do and what it was all about."

And that wasn't the only time Goldberg told his story. As discussed in his 1995 obituary in the Dallas Morning News, Goldberg was interviewed for Litigation Magazine in 1991. This is a legal publication, and not one readily found online or in in your local Library. The quotes from this article cited in his obituary, however, indicate that he repeated his much-earlier recollections to the Johnson library almost word for word. The one notable addition, however, was that Goldberg now claimed that when he told Johnson he'd automatically become president upon Kennedy's death, and didn't need to be sworn in, Johnson expressed surprise, and asked *"Don't I need to be sworn in?"* Perhaps, then, this reflects that someone--most likely Jack Brooks or Albert Thomas, but possibly Robert Kennedy--had told Johnson it wasn't just desirable he be sworn in, but necessary.

In any event, hmmm... Johnson asked Goldberg the same questions he asked Bobby. Hmmm... Goldberg made no mention of Johnson's saying he'd already talked to Bobby. Hmmm... When Bobby talked to Manchester, months before Johnson issued his statement to the Warren Commission, he said Johnson told him that *"a lot of people"* had told him he should be sworn in in Dallas--*"a lot of people."* That suggests more than Jack Brooks and Albert Thomas--the two congressmen with Johnson encouraging him to take the oath. It's reasonable to assume, moreover, that Johnson wouldn't even mention this to Bobby if these *"people"* were unfamiliar with the law. It seems likely, then, that Johnson called Bobby after talking to Goldberg, after he'd already decided to be sworn in by Hughes. In such case it follows that Johnson only called Bobby for political reasons, and that the story he'd told Marie Fehmer on the plane--that he'd called Bobby to find out about the oath, and that he only called Hughes after being told to take the oath by Bobby--was a deliberate fabrication.

But what does Marie Fehmer have to say about all this? Well, she's kind of all over the map. Manchester interviewed her on 6-11-64. Note that this is before he spoke to Hughes and discovered Sanders' role in tracking her down, spoke to Sanders and discovered someone had called him from the plane, and spoke to Goldberg and discovered he'd actually spoken with Johnson. Although Manchester's notes on their discussion are still not widely available, it seems probable she told him the story as it's written in her notes. In Manchester's book, after all, he describes her walking into the bedroom on the plane, and Johnson telling her to write down what happened when he called Robert Kennedy. It does not reveal that she was actually in the room when he called Kennedy.

And yes, you read that right. In an 8-16-72 interview with the Johnson Library, she described her activities on the plane: *"For the first hour or so, as far as I got was the sofa room. I didn't know about*

the rest of the plane. During that time, I know we called Walter a couple of times in Washington. I remember hearing the Vice President say, 'Do you know whether or not this is some sort of plot? Are they out to get a lot of us?' He was very much concerned at that time about whether or not it was a plot. I remember he asked that all the TV's be turned on in the plane. And I remember the search for Sarah Hughes. It was at that time that he began to feel a little strange, in that he was in public as far as all these strangers were concerned, all the Kennedy people...Here was just a man who needed to make maybe the biggest decision of his life and didn't want to make it in a circus, just like you might like to go into a phone booth instead of talking out in the middle of an airport. So we went into the bedroom. My memory is that the beds were made up; two single beds were on either side of the stateroom. There was a desk and a chair, and the desk was facing one of the beds. He sat on one of the beds, and I sat at the desk in the chair, where the phone was. We started looking for Sarah Hughes, and it wasn't easy."

So Johnson went into the bedroom to look for Hughes. Hmmm... It's usually reported that he went into the bedroom to call Bobby. Fehmer thereby supports the possibility Johnson went into the bedroom to call Goldberg and Hughes' office and only called Bobby after failing to find Hughes.

Fehmer, however, ruled this out in her oral history. She claimed Johnson's phone call to Hughes came after Johnson *"knew that he had to take the oath of office there. This decision was made after he talked to Bobby and Walter Jenkins."* Hmmm... Perhaps she'd been misled by Johnson. Perhaps she was covering for Johnson. Or perhaps she was simply mistaken. It's tough to say for sure.

But this we can say for sure: there's something odd about Fehmer's notes and recollections regarding Johnson's discussions with Bobby. Her notes reflect that *"The President had talked to McGeorge Bundy via WH line before I got there."* They later reflect that Bundy called in between Johnson's phone calls with Bobby. On 1-30-69, Bundy granted an interview with the Johnson Library. He said *"I telephoned first that afternoon to say to him what I'm sure he had already decided...The burden of my message was simply that he must come back as fast as possible, and of course that was everybody's view from here, and he'd already decided that. I did not get involved in this sort of take the oath here or there kind of question. I think that phone call came after that."* Well, if Marie Fehmer came into the room after Johnson talked with Bundy, and Johnson then described to her a second conversation with Bundy in the middle of a phone call with Robert Kennedy, which she'd supposedly just missed, why single out the first call as one that occurred before she got there? They both occurred before she got there, right? Perhaps, then, she was actually there when Johnson talked to Bundy the second time, and her notes on this were replaced by what Johnson had told her to write.

Let's read the notes again, with the problematic section highlighted. *"1:40 P.M. Arrive Air Force One. Go into bedroom of plane to use phone. The President had talked to McGeorge Bundy via WH line before I got there. **When I walked in, the President looked up and said 'Write this down as what has happened. I talked to the Attorney General...Asked him what we should do...where I should take the oath...here or there...said he would like to look into it...and would notify me whether we should take it here or not... McGeorge Bundy and Walter called me...thought we should come to Washington as soon as could. Told them I was waiting for the body and Mrs. Kennedy. The Attorney General interrupted the conversation to say that I ought to have a judicial officer administer the oath here.'** Then I tried to get Waddy Bullion for the President...he was out of his office. Called Judge Sarah Hughes' office...they said she was not there. The President said that he'd talk to anyone in her office. He got on the phone and told the person at the other end that he needed someone to administer the oath...and to find her...and to get her to Love Field. Judge Hughes called in at 2:02--said she could get to the plane in ten minutes. The President left the bedroom in the plane--where above had taken place--and came into the stateroom to wait Mrs. Kennedy's arrival and to join Mrs. Johnson, J. Valenti, Cong. Thornberry, Cong. Brooks, Cong. Thomas, Rufus Yongblood and MF. Mrs. Kennedy arrived at 2:02*

with the body. She was met by the President and Mrs. Johnson and comforted."

Now let's re-read her typed-up notes, without the part put in by Johnson: *"1:40 P.M. Arrive Air Force One. Go into bedroom of plane to use phone. The President had talked to McGeorge Bundy via WH line before I got there. Then I tried to get Waddy Bullion for the President...he was out of his office. Called Judge Sarah Hughes' office...they said she was not there. The President said that he'd talk to anyone in her office. He got on the phone and told the person at the other end that he needed someone to administer the oath...and to find her...and to get her to Love Field."* (Note: the section in Fehmer's notes on the phone calls with Kennedy most probably resided here prior to Johnson's replacing them with his own version.) The notes continued: *"Judge Hughes called in at 2:02--said she could get to the plane in ten minutes. The President left the bedroom in the plane--where above had taken place--and came into the stateroom to wait Mrs. Kennedy's arrival and to join Mrs. Johnson, J. Valenti, Cong. Thornberry, Cong. Brooks, Cong. Thomas, Rufus Yongblood and MF. Mrs. Kennedy arrived at 2:02 with the body. She was met by the President and Mrs. Johnson and comforted."*

Now, the notes read much better, and make a lot more sense, without the part put in by Johnson. This supports the possibility the notes Fehmer typed up on 11-22-63 were inaccurate, and deliberately so... Let's reread the offending passage: *"When I walked in, **the President looked up and said 'Write this down as what has happened...'**"* Well, there it is. Fehmer had pointed her finger at Johnson in her notes.

And this isn't just silly conjecture on my part. In her 1972 oral history, Fehmer as much as admitted the section of her notes on Johnson's phone to Bobby was a lie. Yes, amazingly, she claimed she was in the room during the Johnson/Robert Kennedy phone calls about the swearing-in. She asserted: *"I heard the President's end of it, but I didn't overhear anything that Bobby said, because I was just there."* And that was just the half of it. When discussing the second phone call, she said *"I think Bobby started it and turned the phone to Katzenbach."* When then asked what their voices were like, she said Katzenbach's was *"controlled; he was like steel. Bobby's was not when he started. I remember when he started, I kept thinking, 'You shouldn't be doing this.'"*

So, she was not only in the room when Johnson talked with Robert Kennedy, she remembered the sound of Kennedy's voice!

This brings us back to Spinuzzi, Judge Hughes' law clerk. Spinuzzi was never interviewed by the Warren Commission, nor by the Johnson Library. He never made a statement to the FBI. He was, however, interviewed by the Dallas Morning News in 1983 and 1988, and quoted in The Dallas Morning News on 11-20-88. He claimed that, after receiving the initial phone call from Marie Fehmer: *"I think the phone rested on the cradle 20 seconds, and it rang again. It was Vice-President Johnson... He said 'I want Sarah Hughes to meet me at the airport. President Kennedy is dead, and I want her to swear me in. I don't care what you have to do--find her.' About 20-25 minutes later, she just by chance called in. She immediately asked us to locate the oath of office."*

So, Fehmer suggested there had been some trouble finding Hughes, and Spinuzzi thought Fehmer's first phone call to Hughes came 20-25 minutes before he told Hughes anyone was looking for her. Their recollections are thereby consistent, and consistent with the implications of Sanders' statement he'd first been called by Goldberg, and Goldberg's statement he'd just got home when he received the call from Johnson. Fehmer's notes say Hughes called in at 2:02. If accurate, this suggests that Johnson decided to have the oath administered by Hughes around 1:42--a few minutes after reaching the plane. This suggests as well that he first called Robert Kennedy to discuss the oath 14 minutes or so after he'd already decided to have the oath administered by Hughes.

But what if Fehmer's notes were inaccurate, and Hughes really called in as Mrs. Kennedy arrived, at

2:14? Well, that's no better for Johnson. That would mean, if Spinuzzi's memory is to be trusted, that Johnson called Hughes' office between 1:49--1:54, just before calling Kennedy at 1:56.

It seems clear then: Johnson called Hughes before talking to Kennedy.

And Spinuzzi wasn't the only one suggesting this scenario in an article written for the 25th anniversary of the shooting. On 11-22-88, the Washington Post published an article on Johnson's first day in office by former Johnson aide--and chief defender--Jack Valenti. Valenti, who sat with Johnson in the presidential compartment for much of the flight back from Dallas, asserted that on the plane *"LBJ made a decision that proved to be wise. He made a phone call to Robert Kennedy, the attorney general, and told Kennedy he was determined to be sworn in on the plane before taking off. Kennedy reminded him he didn't have to be sworn in there. He was president by virtue of the Constitution, and the swearing-in was not immediately required. Johnson murmured that he understood, but he would be sworn in as soon as U.S. District Judge Sarah Hughes had arrived and the body of the late president was safely on board."* So, there it is--straight from the mouth of Johnson's biggest defender--Johnson not only was not told by Robert Kennedy he needed to be sworn in in Dallas, as he later insisted, but he'd decided to have Judge Hughes give him the oath before he'd even called Bobby.

Now, to be fair, there are reasons not to trust Valenti's memory. When interviewed on 10-18-69 as part of the Johnson Library Oral History project, and asked about the events leading up to Johnson's taking the oath of office on the plane, he replied *"I was told that he had talked to the Attorney General, but I'm not aware of that. By the time I came aboard, I think that probably the decision was already made."*

But there are reasons to doubt this as well. Johnson was still alive in 1969. And the controversy surrounding Manchester's presentation of Johnson's behavior on the plane was still fresh. And here was Valenti being interviewed by Johnson's Library. Well, do you think the ever-loyal Valenti would tell what he knew about Johnson's phone call to Kennedy, or just play dumb? I believe we should suspect the latter.

So how did Valenti describe these events after Johnson's death? Well, his 1975 book on Johnson entitled *A Very Human President* declares that, after coming aboard a bit after Johnson, and seeing Johnson come into the office area of the plane: *"Unknown to me LBJ had just placed a call to Robert Kennedy, the attorney general, both to express his deeply felt condolences and to officially ask for advice. Both Johnson and the attorney general had determined that the oath of office should be given on the plane before Air Force One departed for Washington."* Well, okay. He's repeating the story Johnson told the Warren Commission. The book was a tribute to Johnson, after all.

So, then, the first time Valenti let on that Johnson had decided to be sworn in before talking to Bobby was 1988, 25 years after the shooting. Should we believe him?

I suspect so. In a 7-15-91 interview with authors Deborah Hart Strober and Gerald S. Strober, subsequently published in *The Kennedy Presidency, An Oral History of the Era*, Valenti similarly related that *"Johnson had determined he'd be sworn in in Dallas, which was a brilliant move, although Robert Kennedy and Katzenbach suggested he get out of there fast."* The implication, at least to me, is that Johnson had come to his determination before talking to Kennedy. But it is less than clear.

In 2007, Valenti published *This Time, This Place*, a memoir. This clears it up a little. In that Valenti presented the phone calls Johnson made once in the air--such as his phone call to President Kennedy's mother--as taking place when Johnson first reached the plane, this book revealed that Valenti's latter-day memories weren't particularly credible. And yet, it's still of interest that Valenti claimed Johnson consulted with Deputy Attorney General Katzenbach and Attorney General Kennedy before his departure from Dallas, and that they urged *"swift departure,"* and that Katzenbach had further told Johnson the oath was just a *"formality"* and that he could be *"formally sworn in later."* Hmmm... No

mention of Kennedy's opinion. Perhaps Valenti was trying to steer clear of that controversy. In any event, he then wrote that, against the advice of Katzenbach and Secretary of Defense Robert McNamara, Johnson decided to stay put and get sworn in in Dallas. He then asserted that *"Johnson was seeing clearly what others didn't. The swearing-in ceremony wasn't essential to grant him presidential authority, but he saw that the entire world, not just the United States, was in a state of shock. LBJ judged it crucially important that he try to stanch the flow of fear before it spread too far too fast. Though I did not know it, LBJ had already summoned Judge Sarah T. Hughes."*

Well, that confirms it. By 1988, if not long before, Valenti had come to believe Johnson's claim Robert Kennedy had told him to be sworn in before leaving Dallas was untrue, and that Johnson had come to this decision entirely on his own, almost certainly before he'd even spoken to Kennedy.

Conclusion number 8: Johnson lied about the timing of his call to Robert Kennedy, and from the very beginning tried to conceal that he'd called Irving Goldberg and Sarah Hughes' office before ever calling Kennedy.

And so, as you can see, the "2:02" time provided Jacobsen for Robert Kennedy's return call to Johnson was a most inconvenient truth...for Johnson, and his claim he only called Hughes after first clearing it with Bobby.

There was just no getting around it. If Bobby called Johnson at 2:02, as seems unassailable, and Fehmer's notes claiming Hughes called in at "2:02" were incorrect, as seems possible, even likely, and Hughes really called in at 2:18 and said she would be there in 10 minutes, was this really any better for Johnson? Was it better for Johnson if people believed he'd sat on the ground in Dallas without having a specific plan, and that he'd waited 16 minutes or more before calling Robert Kennedy, and then 6 more for Kennedy to call him back, and then another 16 for a judge to call him, and another 12 or so for the judge to arrive?

No, I think not. It's no wonder then that Johnson decided not to talk about the information received by Jacobsen. If Johnson had pursued this matter, and had a public debate on the events of 11-22-63, his house of cards (and lies) might very well have collapsed.

An article in the **12-29-66** New York Times, however, signaled that the criticisms of Johnson in Manchester's book, when coupled with the Kennedy's own feud with Manchester, had hurt the Kennedys more than they had hurt Johnson. The article featured a number of claims by an unnamed Kennedy associate. This associate asserted that neither Robert Kennedy or Jacqueline Kennedy had complained about Johnson's behavior to Manchester, and that the complaints in the book had come from others. It asserted as well that Mrs. Kennedy had written Johnson a number of complimentary notes since the assassination, and that Johnson retained these in his possession. It climaxed in a denial, that really wasn't a denial: *"Mrs. Kennedy never felt that it was wrong for Mr. Johnson to ride on Air Force One," the associate said. "To the contrary, she felt that it would be wrong to leave Mr. Johnson behind."*

Now read that again. The quote gives the appearance of being a denial of hard feelings on Mrs. Kennedy's part. But it's a total dodge. Of course, it wasn't *"wrong"* for Johnson to be on the plane--that wasn't the issue. The issue was his taking over the plane, and holding up its departure so he could be sworn in in Dallas, and then falsely claiming this swearing-in had been Bobby's idea. And, of course, it would have been *"wrong"* to leave Johnson behind. Once again, that wasn't the issue. There was never any question of Johnson being left behind. There was a second plane, after all. The issue was Johnson's failure to leave Dallas when advised to do so, and his refusal to fly home on any plane without Mrs. Kennedy and/or the body. It seems clear, then, that this article signified a concession by the Kennedys to Johnson. They'd acknowledged Johnson had received complimentary letters from Mrs. Kennedy, and were willing to publicly support him in his PR battle against Manchester's book, provided he not

release these letters to the public.

The Rorschach Blot As Seen By Drew Pearson And Jack Anderson

In any event, if Johnson and his people were unhappy with the recent article in Newsweek, fate in the form of columnist Drew Pearson gave them a second chance... A **1-11-67** column by Pearson on the controversy surrounding Manchester's book asserted that Pearson and his assistant Jack Anderson had talked with *"various members of the Kennedy and Johnson staffs"* and had discovered what really had happened on the tarmac at Dallas. Pearson then described some of the difficulties those close to Kennedy were having with the local authorities at the hospital. He then reported: *"Meanwhile, Air Force One, the Presidential plane, had been waiting for Kennedy's body. This delay was on the personal order of the new President, and contrary to the wishes of the Secret Service. Emory Roberts of the Secret Service staff had ordered the plane to take off immediately...But Johnson ordered the plane to wait for Kennedy's body."* Well, that much seems clear. Pearson then came down on the side of the Kennedy's on at least one crucial point. He continued: *"Meanwhile, he telephoned Robert F. Kennedy, the Attorney General, in Washington to ask for a legal opinion as to whether he should take the oath of office immediately or wait till he got back to Washington. Bobby Kennedy did not reply immediately. But Deputy Attorney General Katzenbach called back to advise that Johnson should be sworn in immediately."* Now, this was significant in that it directly contradicted what Johnson had told the Warren Commission--that Kennedy himself had told him to take the oath. It is also significant in that it signifies yet another version of the story. To be clear, Johnson had told the Warren Commission only that *"the Deputy Attorney General, Mr. Katzenbach, dictated the form of oath to one of the secretaries aboard the plane;"* he said nothing of speaking to Katzenbach, or of Katzenbach's advising him to take the oath.

(It seems possible, in fact, that Johnson never even spoke to Katzenbach. In his 2008 memoir *Some Of It Was Fun*, Katzenbach not only failed to admit advising Johnson he should be sworn in, he suggested it had never come up, as the only phone call he recalled was one in which Johnson aide Jack Valenti called him and told him *"We want to swear Vice President Johnson in as President"* and then asked him to verify the words of the oath Katzenbach.)

And that's not the end of the hmmm... In his column on the Manchester book, Pearson went on to explain *"Jackie Kennedy expressed indignation in the original version of the Manchester book that Johnson used her husband's plane. However, the plane contained secret electronic communications equipment which only the President could use in case of emergency. Johnson had flown to Dallas in the Vice Presidential plane, but it did not carry this equipment. The Secret Service had decided that he must use Air Force One for the return journey in order to be able to use this equipment. Besides, he was now President."* Well, this supported the Newsweek article from the week before. Clearly, this was the new line being pushed by those close to Johnson. This story was at odds, of course, with Secret Service Agent Rufus Youngblood's and President Johnson's 1964 statements to the Warren Commission, both of which attributed this decision to O'Donnell.

That Johnson had been telling people it was O'Donnell's idea he fly back on Air Force One, and had suddenly switched to telling people it was the Secret Service's idea he fly back on Air Force One, amazingly, finds solid support in an unexpected place. On 10-1-68, while Johnson was still President, his former aide Clifton Carter was interviewed for the as-yet-unbuilt Johnson Library. When asked the topic of discussion while Johnson awaited final word on President Kennedy, he said *"I think he counseled back and forth with Johns and Youngblood and it was decided that they would leave quickly and come on back to Washington."* When later asked if he'd been involved in any of the discussions on 11-22 leading to Johnson flying home on Kennedy's plane, he responded *"No, I was not. I have understood that this is conceivably a part of the discussion Mr. Johnson had with Kenny O'Donnell and*

Larry O'Brien and conceivably with General Clifton. The judgment seems to have been made largely on the fact that Air Force One had certain sophisticated communication equipment that Air Force Two did not have and that if a man is going to be President of the United States he's got to be in constant contact with all elements at his command. It was thought that that was not entirely possible on Air Force Two. This is what I've been told, and as I said, I had nothing to do--did not participate in any discussion." Note that Carter, one of Johnson's closest associates, was told (presumably by Johnson himself) that Kennedy's advisers (Clifton was Kennedy's military adviser) were responsible for the decision Johnson fly back on Kennedy's plane, and not the Secret Service, or, more specifically, Johnson's bodyguards Johns and Youngblood.

There is reason to suspect, then, that Johnson's new-found excuse circa 1966-1967--that the Secret Service as an entity had ordered Johnson to fly back on Kennedy's plane--was no more true than Johnson's previous excuse circa 1963-1964--that Kenneth O'Donnell had told him to fly back on Kennedy's plane. Lawrence F. O'Brien, the closest aide to Kennedy to retain a closeness with Johnson, and one of the men Carter thought told Johnson to fly back on Air Force One, sat with Mrs. Kennedy at Parkland, and accompanied Mrs. Kennedy, Ken O'Donnell, Kennedy aide Dave Powers, and Kennedy Air Force Aide Godfrey McHugh on the flight back from Dallas. In his 1974 book *No Final Victories*, O'Brien claimed that those sitting with Mrs. Kennedy had resented Johnson's *"taking over Air Force One when his own vice-presidential plane, with identical facilities, was available."*

Well, this is most interesting. The Secret Service was responsible for the President's physical security. The responsibility for the security of Air Force One, and its communications capabilities, rested with McHugh. And yet, a 5-19-78 oral history performed for the Kennedy Library, declassified in 2009 and first reported by historian Steve Gillon in his 2010 book *The Kennedy Assassination--24 Hours After*, quotes McHugh as follows: *"When the President was killed and we were going to fly him back, President Johnson refused to fly on Air Force Two because he said the communications were not the same as Air Force One, which of course was not the case. He just wanted to be on Air Force One. But they were identical."*

Of course, McHugh's credibility is open to question. It seems readily apparent that he didn't like Johnson. By the time of his 1978 oral history, he'd taken to claiming that, after failing to find Johnson on the plane, he finally *"walked in the toilet, in the powder room, and there he was hiding, with the curtain closed."* He then claimed that Johnson *"was hysterical, sitting down on the john there alone in this thing,"* and crying, *"They're going to get us all. It's a plot. It's a plot. It's going to get us all."* Well, this is pretty hard to believe. If this incident occurred, it seems clear it would have to have taken place after Mrs. Kennedy first discovered Johnson in the bedroom. What, did Johnson have a sudden breakdown after she'd left the bedroom, and run into the bathroom crying? I suspect not. Perhaps, then, McHugh had taken to exaggeration over the years.

This brings us back to Pearson's column. Pearson, building upon the accounts of McHugh's behavior aboard the plane found in Manchester's book, reported that McHugh had *"rushed through the plane looking for Johnson and Mrs. Kennedy"* and that McHugh *"later said that he had found Mrs. Kennedy kneeling beside her dead husband, while Johnson was in the washroom changing his clothes."* Now, this suggests McHugh had changed his story over time. That Johnson had been in the bathroom, in retrospect, only makes sense. McHugh had raced up and down the plane looking for Johnson multiple times, and had failed to find him. There was nowhere else for Johnson to have been.

But he hadn't been blubbing in the bathroom, as later claimed by McHugh. McHugh was interviewed by William Manchester on 5-6-64. And yet Manchester, in his book, not only failed to recount McHugh's subsequent claim he'd found Johnson in the bathroom, he claimed McHugh had deduced

Johnson had been in the bathroom after seeing him in the hallway outside the bedroom, and realizing there was no other place for him to have been but a few minutes earlier, when McHugh had checked the bedroom.

That McHugh was telling a reasonable-sounding story regarding his encounter with Johnson to Pearson (or Anderson) in 1967, and to Manchester in 1964, moreover, suggests that his other statements to Manchester might also be credible.

This brings us back to the eye of the controversy, William Manchester's *The Death of a President*. McHugh and others intimately familiar with Kennedy's plane including pilot James Swindal were interviewed by Manchester in 1964. And yet there is nothing in his book built upon these interviews suggesting Kennedy's plane had a superior communications ability. According to Manchester, McHugh twice refused to help plan Johnson's return to Washington after Kennedy's death; his stated reason for this, moreover, was that Johnson had "*his own plane*." He wouldn't have done this, one can only assume, if he'd known the communications equipment on Johnson's plane (86970) was significantly inferior to that on Kennedy's plane (26000).

It's important, then, that we find some support for O'Donnell's, O'Brien's, and McHugh's statements regarding the comparative capabilities of the planes. Well, some support can be found in the initial reports of the Secret Service agents assigned to Johnson at Parkland. None of them mention that Johnson was sent to Kennedy's plane (26000) because it was superior.

It seems likely, then, that Johnson was not just mistaken about the comparative capabilities of the two planes, but lying about his reasons for wanting to be on the plane. On **1-25-67**, Johnson tried to defend his taking Kennedy's plane in a phone call to former Attorney General Nicholas Katzenbach. Johnson complained about sections in Manchester's book he found inaccurate or offensive, and then added "*And the thought that I oughta go to a plane that didn't have the bag, and didn't have the communications--by God, after this terrible thing had happened--is inconceivable to me!*"

He was repeating the lie he'd told Fortas to anyone who would listen!

If he had a legitimate reason to take Kennedy's plane, for that matter, why did he lie to Katzenbach?

His lying about his reasons, after all, suggests an uncomfortable possibility: that his actual reasons were not legitimate.

Let's recall here what Mrs. Kennedy told Schlesinger: "*I don't know if Lyndon had an Air Force One just like it or one of the older planes, but he always kept pushing for a bigger plane. And--or for more--all the kind of things like that he wanted, the panoply that goes with power, but none of the responsibility.*"

Over the next six weeks, Manchester's book was finally allowed to bubble to the surface. It was serialized in four parts, in the **1-24**, **2-7**, **2-21**, and **3-7** issues of *Look Magazine*. The flight home from Dallas was covered in the third part.

The Rorschach Blot As Seen By Charles Roberts

Within a few weeks of its release came the release of Charles Roberts'--yes, the very same Charles Roberts who'd written the 1-2-67 *Newsweek* article so supportive of Johnson--book, *The Truth About The Assassination*. This was, no surprise, a defense of both Johnson and the Warren Commission. Only 128 pages long, and available exclusively in paperback, it was clearly a rush-release, designed to reach a mass market--in a hurry. In fact, when one thinks of the odd fact this rush release was released but weeks before Manchester's book, and was serialized in newspapers the very week Manchester's book

finally hit the streets, and included a list of criticisms of Manchester's book, it's hard not to view Roberts' "book" as a Johnson Administration-sponsored press release.

If so, it served its purpose: it attacked the critics of the Warren Commission, it attacked Manchester, and it even got a dig in at Jackie. At one point, while complaining about Manchester's book, which had only been serialized, and was yet to be published, Roberts complained that the book *"gives the impression that Jackie Kennedy, eager to return to Washington, had to wait endlessly for a Texas judge to come and swear in Johnson. ('Then the full force struck her. An hour, she thought. My God, do I have to wait an hour!') The fact is that Mrs. Kennedy had to wait just 20 minutes. She boarded the plane at 2:18, Judge Hughes boarded at 2:30, and the oath was administered at 2:38."* This was, of course, unfair, to both Manchester and Jackie. Manchester was almost certainly just repeating what Jackie had told him, and Jackie was responding to what, as she recalled, Johnson had told her. If anything, Roberts should have noted that Mrs. Kennedy's words suggested she'd spoken to Johnson before he'd talked to Judge Hughes and had found out she was just ten minutes away, and have proceeded to discuss the ramifications of Johnson's deciding to be sworn-in in Dallas without even knowing how long it would take.

Besides--where did Roberts get off criticizing Manchester on this issue? Roberts was one of but two newsmen on the plane back from Dallas. He wrote a number of articles on the assassination. And yet he never once mentioned that Johnson's deciding to take the oath of office in Dallas had delayed Mrs. Kennedy's departure by even one minute.

There was just something odd about the book. The foreword to the book by Kennedy and Johnson's former Press Secretary Pierre Salinger offered a smug criticism of the Warren Commission's critics, conveniently dividing them into three categories: 1) scholars with a sincere interest; 2) opportunists after notoriety or money; and 3) *"persons who clearly have to be labeled as psychotic."*

And the bulk of the book was no better. Roberts was supposedly a newsman, and yet, on point after point, issue after issue, he took Johnson's side based purely on Johnson's say-so. He actually cited Johnson's claim he'd discussed taking Air Force One with O'Donnell as proof O'Donnell knew Johnson was taking the plane. He failed to mention that O'Donnell had not only told Manchester this was untrue, but had said as much in his Warren Commission testimony--sworn testimony--the kind Johnson had failed to provide.

Roberts was clearly under Johnson's influence. He even repeated the newest Johnson party line--that Johnson had to take Kennedy's plane because, you know, the communications... He wrote: *"In Manchester's book, Johnson's performance that day was marred from the start by his decision to fly back to Washington aboard Air Force One—USAF 26000, the plane on which Mr. Kennedy flew into Dallas. USAF 26000 was then the newest of four Boeing 707 jets converted into luxurious flying offices for use by the President and other VIPs, (There is, incidentally, much public misunderstanding of the term 'Air Force One.' The Air Force uses it to designate any plane on which the President is embarked, whether it is a 707, a Jet Star or a puddle-jumping Convair. Thus any plane Mr. Johnson might have taken from Texas automatically would have become Air Force One. Manchester suggests—by invoking a Kennedy staffer who was 'dumbfounded' by LBJ's action — that Mr. Johnson should have left town on Air Force Two, the Presidential backup plane on which he had been flying..."* Roberts then complains about O'Donnell. He then offers: *"There was a solid reason—never mentioned by Manchester—for Mr. Johnson to board the plane on which Mr. Kennedy had arrived. USAF 26000 then contained far more and better communications equipment — transmitting, receiving, coding and decoding— than any of the backup jets. What orders the new President would have to give during that return flight no man knew. It would have been reckless for LBJ to take any but the best-equipped plane."*

Roberts failed to relate his source for this malarkey, of course, and failed to explain why no one, but no one, had mentioned anything like this to the Warren Commission.

And he didn't even believe it. If he had, one can only assume, he wouldn't have offered up a second excuse towards the end of the book. Yes, strange as it may seem, Roberts eventually concluded *"the argument that Johnson should have limped home aboard a back-up plane, leaving Jackie and the dead President behind, is a conspicuous example of frivolous, biased nit-picking. Whether or not Manchester or O'Donnell approves, the propriety of Johnson accompanying the body of his martyred predecessor home is unassailable. I shudder to think of the charges of haste and callousness that would have been leveled at Johnson if he had dispatched Mrs. Kennedy on that lonely journey bearing only the casket, herself, and a corporal's guard of aides. Kennedy, at that point, belonged to the ages, not to his aides."*

Well, that's pretty sick, wouldn't you say? It is a long-standing tradition of civilized societies that the bodies of the fallen belong to the families of the fallen, not their co-workers. Upon departure from Parkland, Kennedy's body belonged to his wife. It did not belong to Johnson. As not even Roberts could possibly believe Johnson's holding court in the next compartment over on the plane--not to mention the sound of Roberts and Smith tapping away at their typewriters further away on the plane--could be of any comfort to Mrs. Kennedy, it seems clear he considered her comfort a low priority. As he *"shuddered"* to think of the awful charges that could have been leveled at Johnson should he have allowed Mrs. Kennedy to fly home without distraction, moreover, it's clear Roberts considered President Kennedy's casket Johnson's property, to parade before the cameras as he pleased, or whatever it took to avoid the *"awful charges"* he anticipated in his clearly selfish mind.

The Rorschach Blot As Seen By Ralph de Toledano

On 4-7-67, after months and months of editing, re-editing, and delays related to its serialization in Look Magazine, William Manchester's *The Death of a President* finally hit the bookstores. It was an immediate best-seller. It was followed just days later, however, by a book on Robert Kennedy, "RFK: The Man Who Would Be President," by Ralph de Toledano. In discussing Robert and Jacqueline Kennedys' fight with Manchester, de Toledano asserted that this was in large part because *"both of them realized that their account of Lyndon Johnson's behavior on the Presidential plane which flew John F. Kennedy's body back to Washington would not stand up to objective scrutiny."* Well, this was obviously untrue--the discussion of Johnson's behavior on the plane considered so controversial in the months leading up to the book's publication was still there in the final version--after receiving Jackie's approval.

And that was just the beginning of de Toledano's discussion of the book. He then put the book in context. He asserted that in the weeks before the assassination Robert Kennedy was conspiring to push Johnson off the ticket in 1964, and that Kennedy could have *"put a stamp of disapproval on the books and magazine articles"* suggesting *"Lyndon Johnson was somehow responsible for Jack Kennedy's death"* but did not, because *"the Kennedys wanted to keep it going."* Well, this might as well have been Johnson speaking. He'd made these very same charges to Abe Fortas in taped phone calls going back to the previous October.

De Toledano then specified some of what he claimed were problems in Manchester's book. He wrote that the book *"tried to obscure the fact that Johnson had taken the oath of office as President in Texas at Bobby's suggestion."* This was a lie. Manchester dealt with this "fact" head-on by pointing out that it might not be a fact, and that there were two witnesses to it not being a fact. De Toledano then claimed *"There was Kennedy resentment that Johnson had been taken to the Presidential cabin in 'Air Force One,' though this had been done at the insistence of the Secret Service."* This was another lie. Assuming

that by the 'cabin' de Toledano meant the bedroom, it was Johnson's own decision to use the bedroom. Yes, he'd initially been led to the bedroom, but he declined to make use of it, only to enter at a later point to use the phone. De Toledano then attacked O'Donnell for ordering the plane to take off upon his arrival on the plane, which, while true, hid that O'Donnell hadn't realized Johnson was on the plane when giving this order. De Toledano then complained that the *"Kennedy party made it a point to ride in the rear of the plane, as far from Johnson as possible."* Well, this was another lie. They were riding with the coffin in an area just behind the presidential area where Johnson was riding. They were riding with their friends' coffin and widow, reminiscing about his life. What did de Toledano expect--that they sit around and talk shop with Johnson, or line up to kiss his ring?

De Toledano's, and apparently Johnson's, blindness, even sickness, on these matters is confirmed, moreover, by his final complaint. He wrote: *"the real blow to Johnson came when Air Force One arrived in Washington. President Johnson had asked that a ramp be brought up to the plane so that he and Mrs. Kennedy could leave together with the President's body. ('He felt,' a Johnson aide later said, 'that it was necessary to show himself to the nation and to the world, so that everyone could see that the traditional transfer of power had taken place.') But Bobby had made different arrangements. The moment the plane came to a stop and steps were pushed up to the forward entrance, Bobby raced up into the plane and down its entire length to join the Kennedy party. At the rear door, he had arranged for a forklift to lower the casket. When President Johnson tried to make his way to the rear of the plane, he was blocked by Kennedy aides. Bobby Kennedy, and not Johnson, escorted Jacqueline Kennedy off the plane. By the time Johnson was able to emerge, the casket which bore Kennedy's body had been loaded into the ambulance, with Bobby and Jacqueline, and started for the naval hospital at Bethesda. And while the nation grieved, Bobby, Jacqueline and the Kennedy staff, held a council of war at the White House to plan ways to use the funeral as a means to 'build up the Kennedy image.'"*

Feel free to read that again, and ponder how sick one would have to be to find Kennedy's supposedly awful behavior anything but heroic. Imagine that your extremely successful older brother has been murdered on a business trip. Imagine that your sister-in-law, who not only witnessed the murder of your brother, but was splattered with his blood and brains, has been corralled into returning to town with the new head of the company. Imagine that he has arranged a photo op where they drive up to corporate headquarters, and she emerges from the car on his arm. Wouldn't YOU, or any decent person, try to help her from the car, and get her away from such a man as fast as possible? I know I would. And I bet you would, too. And yet de Toledano, after speaking to a Johnson aide, takes Johnson's side in this matter. It seems likely, then, that the timing of de Toledano's book was no accident, and that de Toledano, as Roberts, was making Johnson's case to the public...

Conclusion number 10: Johnson engineered a media response to Manchester's book which was both insulting to Robert Kennedy, and dishonest.

And he wasn't alone. What happened next belongs in the "truth is stranger than fiction" file. In **July 1967**, Commentary Magazine featured an article on the Manchester controversy entitled "Manchester Unexpurgated." The writer of this article had reviewed an early draft of Manchester's book, and had noted a bias against Johnson. This author attacked Manchester for this bias, and even went so far as to claim Manchester had created *"fictitious episodes for the purpose of heightening the melodrama."* Chief among these purportedly fictitious episodes was the scene in Manchester's book where Mrs. Kennedy walked into her bedroom on Air Force One, only to find Johnson in the bedroom with his secretary. The writer of this article was Edward Epstein, the author of Inquest, perhaps the most prominent conspiracy book from the year before, and a book Manchester sought to discredit in his book. Apparently, Epstein was out for revenge.

But in his zest for revenge, Epstein missed out on something--something big. Manchester's account proved Johnson's statement to the Warren Commission to have been incomplete and misleading.

Epstein, and the research community he'd help spawn, should have seized upon Johnson's omission, and cited it as a possible indication of further omissions. But instead he attacked Manchester.

Epstein chose the wrong target. Manchester was telling the truth. When he responded to Epstein in his 1975 book *Controversy*, Manchester claimed that Johnson's being discovered in the bedroom by Mrs. Kennedy was *"described to me by Jackie during a taping session on May 4, 1964."* Well, that wasn't much of a surprise. What was surprising, however, was that he also claimed he'd received confirmation from not one but two other witnesses: first, by Sgt. Joseph Ayres, *"an Air Force One steward who was standing in the corridor just outside the compartment,"* on September 6, 1964, and second, by Marie Fehmer, *"Johnson's personal secretary, who was present in the aircraft's bedroom at the time,"* on November 6, 1964.

Hmmm... Let's return to Marie Fehmer's notes. These notes, we should recall, were written on the plane. They were, at least in part, dictated by Johnson. Now read how she described the period leading up to Mrs. Kennedy's arrival on the plane... She wrote: *"Judge Hughes called in at 2:02--said she could get to the plane in 10 minutes. The President left the bedroom of the plane--where above had taken place--and came into the stateroom to wait Mrs. Kennedy's arrival and to join Mrs. Johnson, J. Valenti, Cong. Thornberry, Cong. Brooks, Cong. Thomas, Rufus Youngblood, and MF. Mrs. Kennedy arrived at 2:02 with the body. She was met by the President and Mrs. Johnson and comforted."* Well, heck. Fehmer had admitted that Johnson had gotten off the phone in the bedroom at 2:02, and that Mrs. Kennedy had arrived at 2:02. She'd also claimed, however, that Johnson had already left the bedroom before Mrs. Kennedy had arrived. She'd even included a list of witnesses to this fact!

Well, this is quite revealing. Was Marie Fehmer on her own, or under President Johnson's guidance, creating a false history--from Johnson's first moments as President--that could then be used to protect him from outside criticism? Could he really have been so worried about what might otherwise be considered an embarrassing incident, that he would knowingly falsify the history of his presidency from its very beginnings?

Sadly, it appears so. On 8-16-72, Marie Fehmer was interviewed for the Johnson Library Oral History program, and revealed more than anyone could reasonably have expected. She claimed that Johnson made his first calls from the President's office space (the eventual site of the swearing-in), and that he'd decided to go into the presidential bedroom to call Mrs. Hughes. She then admitted: *"No one notified us that Mrs. Kennedy was coming. Obviously if they had, the arrival would have been different. But we were still in there making phone calls. I don't know how they slipped up or how the Secret Service missed it, but we were not notified. The only thing that happened is that he started to leave the bedroom to go somewhere, and I followed him. As he opened the door, there was Mrs. Kennedy. Well now, you see what a misunderstanding that can bring about to her. She was entering her private bedroom. She was surrounded by her husband's friends, who saw a stranger, in his shirt sleeves yet. It was hot on that plane, no air conditioning on the ground. So she saw the stranger in his shirt sleeves in the hallowed ground...we, of course, scurried out of that bedroom. It was really embarrassing."*

Fehmer--by then married and with the last name Chiarodo--was not asked why the notes she'd written up on the plane had specifically ruled out such an incident. Nor did she volunteer an explanation.

Conclusion 11: the notes created by Marie Fehmer on the plane were incomplete, and deceptive.

The Rorschach Blot As Seen By Jim Bishop

And from there things only got uglier. In **May, 1968**, newspaper columnist Jim Bishop interviewed President Johnson for *The Day Kennedy Was Shot*, a pro-Johnson alternative to Manchester's *The Death of a President*. Johnson purportedly proof-read this book prior to its publication that November.

And yet Bishop's account of the decisions made at Parkland largely supported O'Donnell's recollections...

To be clear, Bishop claimed that, in defiance of the Secret Service, Johnson refused to leave Mrs. Kennedy behind at Parkland and fly off on Air Force One before President Kennedy's death could be confirmed. Well, everyone agreed on that. Bishop also reported, however, that, while the doctors were still working on Kennedy, O'Donnell told Johnson to go to the airport without Mrs. Kennedy, and that Johnson then *"conceded it would be just as well to wait for her on the plane."* Bishop does not, one should notice, have O'Donnell agree to such a thing. In fact, on the next page, after O'Donnell has excused himself, Bishop has Johnson decide it would be okay to board Air Force One and wait *"for President and Mrs. Kennedy."* Bishop put this last bit in quotes, moreover, indicating these were Johnson's words, not his. Bishop then related that Johnson was concerned that a quick return to Washington would make him look like he was *"fleeing"*--again, Bishop put this in quotes, indicating that this was Johnson's word, not his. Bishop then claimed Johnson sought advice from *"everyone around him,"* and that they all agreed he could not leave Dallas on Air Force One without Mrs. Kennedy, or it would look like a *"precipitous power grab."*

Bishop then came to the crucial moment in Johnson's original story--the return of O'Donnell confirming that the President was dead. It was here that Johnson had told the Warren Commission, *"O'Donnell said that we should return to Washington and that we should take the President's plane for this purpose."* In Bishop's take, however, O'Donnell tells Johnson of Kennedy's death, and quickly excuses himself to see to Mrs. Kennedy. Johnson then decides to leave on his own, but feels uncomfortable doing so without O'Donnell's *"endorsement."* He then sends his bodyguard Rufus Youngblood to ask O'Donnell if he should use Air Force One, and leaves after Youngblood returns with O'Donnell's one-word answer: *"Yes."* Bishop then adds, in a footnote: *"Mr. O'Donnell denied that he was asked about Air Force One. There is no doubt that Johnson, thinking ahead, wanted to show that, even in tragedy, the continuity of government would be smooth. Therefore, from the start, he wanted to be aboard 26000 with his dead chieftain and the widow."*

Bishop then described Johnson's rapid departure from the hospital, his arrival on Air Force One, and his initial phone call to Robert Kennedy. Surprisingly, Bishop said that Johnson's call to Robert Kennedy was *"one of the first calls"* made by Johnson on the plane, and not the first call, as claimed by Johnson in his statement to the Warren Commission. Even more surprising, Bishop failed to take Johnson's side in his dispute with Robert Kennedy. Instead of supporting Johnson's assertion to the Warren Commission that Robert Kennedy then called him back *"and said that the oath should be administered...immediately, before taking off for Washington,"* Bishop described but one phone call between Johnson and Kennedy, one in which Kennedy *"wasn't sure when it should be administered or by whom,"* and *"promised to have Assistant Attorney General Nicholas Katzenbach call back with the correct answers."* Hmmm... This was pretty much the same line pushed by Pearson in his article the year before. Had they used the same sources? Had Johnson retreated from his position on this matter?

Or was Bishop just a lousy journalist? Its' tough to say for sure. But one can say for sure that in the long run Bishop's book hurt Johnson's position nearly as much as it helped it. It seems clear that much of the discussion on the swearing-in in Bishop's book came from Johnson. And yet, Bishop reported that after Johnson made his decision to call Sarah Hughes, *"The communications people required a couple of minutes to find out her local office number."* This added delay, of course, pushes the presumed time for Johnson's deciding to call Hughes even further forward of the time she called in (which Fehmer placed at 2:02), which was already way too early to have come as a result of the call from Robert Kennedy (which the White House Communications Agency placed at 2:02).

Bishop then related the difficulty removing Kennedy's body from the hospital, and the arrival of those traveling with the body at Air Force One. He was surprisingly fair on these points as well. In keeping

with O'Donnell's claim he assumed Johnson had departed before those traveling with the body arrived at the plane, Bishop reports that Lawrence O'Brien was *"flabbergasted"* to see Johnson coming down the aisle to greet Mrs. Kennedy, and reports further that *"there can be no doubt"* Mrs. Kennedy was surprised to see the Johnsons on the aircraft, *"not number two."* He even allows *"It is understandable if she felt resentful, because the trip home to Washington would normally be a 'wake,' a private mourning."*

Bishop's take was thereby consistent with Manchester's on three crucial points: 1) it was Johnson himself who'd decided to fly back on Kennedy's plane; 2) Robert Kennedy hadn't told Johnson he should be sworn in in Dallas; and 3) the Kennedy entourage had no idea Johnson was on the plane before their arrival on the plane. The one clear mistake in Bishop's account, moreover, was his bit about Youngblood following O'Donnell out into the hall. Youngblood had never described such a thing.

But someone else had. Let's recall here that Emory Roberts, in his 11-29-63 report, declared that, after escorting Mrs. Johnson to visit Mrs. Kennedy, and then returning to Johnson's, *"I left again, this time upon request of the Vice President to double check with Mr. Kenneth O'Donnell, if it would be O.K. for the Vice President to take AF I and return to Washington, D.C. I located Mr. O'Donnell in hallway and he said 'yes'. The Vice President was informed that Mr. O'Donnell stated that he could leave. The Vice President said in effect, that he didn't want to leave without the approval of a staff member or the Secret Service."* He then related that Johnson was told of Kennedy's death at 1:15, and left the building at 1:35.

So, hmmm, what to make of this? Well, Roberts' report is somewhat harmful to O'Donnell in that it appears to support that O'Donnell was-- yes, indeed--asked about Johnson's using Kennedy's plane. But look again. Roberts said that he was asked to double-check about Johnson's taking Air Force One and flying back to Washington, and that Johnson was then informed that O'Donnell said it was okay for him to leave. Leave... No mention of which plane. The plane flying the President is automatically deemed Air Force One. It seems possible, then, that Roberts realized that he'd failed to properly specify the plane on which Johnson would be leaving when talking to O'Donnell, and was unwilling to specify that he'd told O'Donnell Johnson was planning to fly back on Kennedy's plane.

This possibility is supported, moreover, by William Manchester's book from the year before. Manchester interviewed O'Donnell on 5-4-64, 6-4-64, 8-6-64, and 11-23-64, and Roberts on 12-4-64 and 4-26-65. His account of their encounter would presumably be balanced. And yet Manchester reported that, when Kennedy's death seemed apparent, and the Secret Service was begging him to leave Parkland, Johnson *"told the agents he would not move without approval from a member of Kennedy's staff, preferably Ken O'Donnell. Roberts sought out O'Donnell in Major Medicine. 'Johnson wants to go,' he said. 'Is it O.K. if he uses the plane? O'Donnell nodded--a gesture to be borne in mind in the light of the subsequent confusion--and Roberts reported back to Johnson, 'Ken says it's O.K.'"*

Roberts' statements are much more harmful to Johnson, then, as they support that Johnson had misled the Warren Commission when he told them *"O'Donnell said that we should return to Washington and that we should take the President's plane for this purpose."* Not only was it not O'Donnell's idea for Johnson to take Kennedy's plane, but Johnson was so uncomfortable with it being his own idea that he forced Roberts to head down the hall and ask O'Donnell if it was O.K. To which O'Donnell nodded. Nodded. Not exactly a confirmation he understood that "the plane" Johnson was planning on leaving on was Kennedy's plane.

Roberts' statements are also harmful to Bishop. Not only did Bishop have the wrong Secret Service Agent talking to O'Donnell in the hall, he had him talking to O'Donnell after Kennedy's death just

before Johnson left for the airport when Roberts' report presents the incident as taking place 20 minutes or more earlier, before Kennedy's death had been confirmed.

And that's not remotely the worst part of Bishop's book. There were so many questionable parts in his book, it would be difficult to pick but one. But certainly among these was Bishop's defense of Johnson's decision to be sworn-in in Dallas. He'd read the Constitution, and had concluded that Johnson **NEEDED** to be sworn in before he could perform any duties as President. He actually claimed that, upon reaching Air Force One, *"Lyndon Johnson was no longer Vice-President and had none of the powers of that office; he was now President of the United States, with none of the powers of that office. He could not have protected the country if, as some surmised, the death of Kennedy was part of a much larger plot to bring the government to its knees."*

Well, this, of course, was nonsense. The Vice-President is sworn in when he becomes Vice-President, and becomes President upon the death of his predecessor. It's the same oath and everything. The swearing-in as President is just a ceremony. I mean, really, Bishop fancied himself an historian. An hour or so at the library would have shown him that Johnson was the eighth Vice-President to assume the office of President upon the death of his predecessor, and that 1) John Tyler had taken the oath of office 2 days after the death of William Henry Harrison, 2) Millard Fillmore had taken the oath of office the day after the death of Zachary Taylor, 3) Andrew Johnson had taken the oath of office 4 hours after the death of Abraham Lincoln, 4) Chester A. Arthur had taken the oath of office 3 days after the death of James Garfield, 5) Theodore Roosevelt had taken the oath of office 13 hours after the death of William McKinley, 6) Calvin Coolidge had taken the oath of office 4 hours after the death of Warren G. Harding, and 7) Harry Truman had taken the oath of office 2 hours after the death of Franklin D. Roosevelt. The oath could have waited, although Johnson, apparently, could not.

Slouching Towards Consensus

Even so, with the release of Bishop's book, it appeared the dispute was slouching towards consensus...a consensus unfavorable to Johnson. When interviewed on **7-23-69** for the Johnson Library, Kenneth O'Donnell said that, after Kennedy was officially pronounced dead, he went to Johnson and *"strongly urged him to go right to Love Field. Number one, if it was a conspiracy no one would know what hospital we were at and no one would have any route covered and he'd be safer than if they had had a route in the newspaper. It only took ten minutes, and speed was of a necessity. Get back to Washington. Which he agreed to do."* He then described the Secret Service's removal of Kennedy's body from the hospital, the arrival of the Kennedy entourage on Air Force One, and their subsequent discovery that Johnson was on the plane. He then said that, when he approached Johnson, *"Before I could say anything he said he'd talked to Bobby and that Bobby told him he ought to be sworn in right there. On the surface it doesn't make any sense, because he's president of the United States the minute they say 'you're dead.' You don't need to ever be sworn in. I think the man wanted to be sworn in in Texas, and there's nothing really wrong with that except if you've got a crisis and a conspiracy you ought to be up in the airplane, which I thought at the time. But that's not my business, he's president. I was just concerned about Jackie."*

When, later asked a follow-up question, on whether Bobby had actually told Johnson he should be sworn in right there, more surprising, O'Donnell continued to vent. He said: *"Bobby's recollection of the conversation--obviously, he's hazy, must be. I reconstructed it in the fashion that he called Bobby to tell him what happened and also to get what the legal views were. I don't know who suggested that, maybe Homer Thornberry did, because really that makes absolutely no sense whatsoever, to be frank with you. He is president of the United States the minute they say, 'You're dead,' with all the powers of the*

presidency. He never has to be sworn in ever in his life. He says Bobby said, and he really sort of hedges that, and he said Bobby put Katzenbach on. In the first place Bobby wouldn't have the slightest idea, I would think that very few people off the top of their head could find what the Constitution really says. I know it is the fact. The fact is you're president. You can get sworn in eight months from now if you feel like it...And I think Bobby got irritated at that because that didn't make any sense, but Bobby didn't know any of the background either. I'm sure he just threw the phone to somebody. There's no question in my mind that Lyndon Johnson wanted to be sworn in by Judge Sarah T. Hughes, an old family friend, and he was afraid somebody was going to take the thing away from him if he didn't get it quick."

Note that O'Donnell not only expresses doubt about Johnson's version of his conversation with Robert Kennedy. but contradicts Johnson's claims on the same two points on which their statements to the Warren Commission were in conflict. He'd thought Johnson was leaving as soon as he reached the airport, on an unspecified plane, while Johnson was under the impression he'd told O'Donnell he would wait for Mrs. Kennedy at the airport on Kennedy's plane. Perhaps O'Donnell had simply failed to hear Johnson's telling him he would wait on the plane. Or perhaps Johnson had made this decision after O'Donnell had left the room.

Johnson himself was unclear on this matter. On **8-19-69**, he granted a taped interview to the ghost-writers of his upcoming memoir, Harry Middleton and Bob Hardesty. Portions of the transcript of this tape were published in the December 2001 Texas Monthly. On the events at the hospital and airplane, Johnson reminisced: *"Mrs. Johnson wanted to see Mrs. Kennedy. And Nellie Connally. Then from there on, there were frequent conversations, and pretty soon they came back and said (Kennedy) was dead. It's all vague in my mind who said what, and where, and who it was. But somewhere in my mind, I knew that this conceivably could be part of something even bigger. So I said, 'Let's get back to Washington as soon as we can.' We went in Air Force One, just as they told us to. I called the attorney general from the plane, and I asked him if I should come back to Washington and take the oath. He said he would call me back, but he thought offhand I should take it there. He was calm and unexcited. Katzenbach came on. The plane was full of people. We stepped into (the presidential stateroom) to get the oath from Katzenbach. I called a lawyer in Dallas, Irving Goldberg. He said he'd get Sarah Hughes. Everyone was saying, 'Let's get this plane off the ground.' I said, 'No, we'll wait for Mrs. Kennedy.'"*

Well, hmmm... Note that Johnson now claimed *"they told us"* to go to Air Force One, and not that O'Donnell had told him as much. Note also that he now claimed Kennedy had said *"offhand"* that he should take the oath in Dallas in the first call, and not that he'd insisted on it during the second call, as claimed in his statement to the Warren Commission.

And that was unsurprising compared to what Johnson claimed elsewhere. When discussing his strong-arming Earl Warren to chair the commission investigating Kennedy's murder, he confirmed that he'd done this in part to clear himself. He admitted *"I shudder to think what churches I would have burned and what little babies I would have eaten if I hadn't appointed the Warren Commission. If there was no Warren Commission, we would have been as dead as slavery."* Hmmm... if only he'd told us who this "we" was... And what evidence he thought Robert Kennedy was planning to use against them...

And that wasn't the last time Johnson discussed his fantastic fear of Kennedy. An 11-28-85 UPI article (found in the Altus Times) reported that historian Francis Loewenheim had just reviewed a recently declassified 30 page transcript of a 1969 interview with Johnson, and had found it of historical interest. (This may very well have been the same transcript later excerpted in the Texas Monthly.) In this interview, reportedly conducted eight months after Johnson left office, Johnson claimed: *"I think that the attorney general seriously considered whether he should let me be president, whether he should really take the position the Vice-President didn't automatically move in. I thought that was on his mind*

every time I saw him the first few days, after I had already taken the oath. I think he was seriously calculating what steps to take. For several days he really kept me out of the president's office. I operated from the Executive Office Building because it was not made available to me. It was quite a problem."

Well, I'll be. We either had a paranoid for a President, or someone with an incredibly guilty conscience. Johnson had told Jackie and everyone who would listen that Robert Kennedy had told him to be sworn in in Dallas--that the country needed continuity, etc. And yet, in his scrambled-egg of a mind, he'd apparently held the concurrent fear Kennedy would try to prevent him from being president. Now, this suggests he'd been lying about Kennedy's telling him to be sworn in, yes? I mean, he couldn't simultaneously believe Robert Kennedy told him to be sworn in and was trying to prevent him from being sworn in, could he? That Johnson's paranoia ran deep, for that matter, is suggested by his similarly stated belief the brief delay in his gaining access to the oval office (so that Kennedy's papers and possessions could be organized and transferred to the archives) amounted to his being *"kept out"* of the oval office. Wow. What did he expect? A crown to descend from the ceiling when he walked into the room? And every sign of Kennedy to magically disappear?

It seems clear from this that Johnson was every bit as twisted as the Warren Commission's depiction of Oswald. And yet there's a key difference: Johnson had a plausible motive.

That Johnson had been lying about O'Donnell as well, and had made the decision to leave Parkland and go to Air Force One after O'Donnell had left the room, was supported, moreover, by Congressman (later Judge) Homer Thornberry, who'd waited with Johnson at Parkland, and had accompanied him to Air Force One... When interviewed for the Johnson Library on **12-21-70** and asked about the events of 11-22-63, Thornberry related that as soon as Johnson received official word of Kennedy's demise *"right then he took charge. He said, 'Now what should we do?' He talked to this agent in charge, a Secret Service man, Rufus Youngblood. He thought perhaps they ought to go on to the plane."* Note that in Thornberry's recollection, Johnson conferred with Youngblood, and not O'Donnell. This supports the previously-discussed possibility that when Youngblood told the Warren Commission that, after being told of Kennedy's demise by O'Donnell, Johnson *"agreed that we would go on to the airplane and board the plane and wait until Mrs. Kennedy and the body would come out"* the agreement was between Johnson and himself--Youngblood--and not O'Donnell, who'd already left the room.

The historical record suggests, then, that if Johnson had told O'Donnell at the hospital he would wait for the First Lady and the fallen president on Kennedy's plane, as he suggested to the Warren Commission, that he did so in a private discussion with his bodyguard Rufus Youngblood, whereby the only one who actually heard him or knew about this plan was agent Youngblood, who then failed to share this information with his fellow agents, including his immediate superiors, Emory Roberts and Roy Kellerman.

This logical deduction, however, has proved a bridge too far for some to cross...

Starting with Lyndon Johnson...

In his **1971** memoir *The Vantage Point*, Johnson kicked the hornet's nest and repeated the story he'd told the Warren Commission. He insisted: *"O'Donnell thought that we should depart for Washington immediately. I asked what Mrs. Kennedy wanted to do. O'Donnell replied that Mrs. Kennedy would not leave the hospital without the President's body. He said that they were waiting for a casket. I could not desert Mrs. Kennedy in that situation and emphatically said so. I told O'Donnell that I would not return to Washington until Mrs. Kennedy was ready to go, and that we would carry the President's body back with us if that was what she wanted. I did agree to go immediately to Air Force One and to wait there until Mrs. Kennedy and the President's body were brought aboard the plane."*

He also stood his ground on the question of the swearing-in. He wrote that, after calling Robert Kennedy, and offering his condolences: *"I told him that both the Secret Service and the members of the late President's staff felt that I should return to Washington at once. Attorney General Kennedy said he would look into the matter and report to me whether the oath should be administered immediately or after we returned to Washington. He also said that he would provide the proper wording of the oath. I then received a call from McGeorge Bundy, the President's national security adviser, and from Walter Jenkins of my staff. They both said that my return to Washington should not be delayed. I told them that Mrs. Kennedy had not arrived with the President's body and that I would not leave under any circumstances until she was aboard. At that point the Attorney General came back on the line. He said that the oath of office should be administered immediately--before taking off for Washington--and that it could be administered by any official officer of the United States. The next call came from Deputy Attorney General Nicholas Katzenbach, calling, I presumed, at the Attorney General's direction. He dictated the wording of the oath to my personal secretary, Marie Fehmer."* Note that Johnson had reverted to form, and was once again claiming Bobby had told him to be sworn-in in Dallas--a claim he'd admitted wasn't true in his 1966 call to Moyers.

But he was not afraid to add something new: Irving Goldberg. After Manchester first exposed the Goldberg connection, and after Goldberg subsequently confirmed his role to the Johnson Library, Johnson really kinda had to say something about him in his account of the day. Johnson continued *"I then called Irving Goldberg, a lawyer friend for many years. We agreed that Judge Hughes, whom President Kennedy had appointed to the U.S. District Court in Dallas, should be asked to administer the oath. Goldberg telephoned Judge Hughes at her office. She was not there, but was expected in momentarily, and a few minutes later she called in."* Note that Johnson had thereby removed both his first call to Hughes' office, and Goldberg's call to Sanders, from the story.

Johnson then continued: *"I explained the situation, and told her that we would send a car for her immediately. She replied that she could get to the airfield faster on her own and would be there in ten minutes. As soon as I hung up, I asked Agent Youngblood to check on the location of Mrs. Kennedy and to let me know the second she arrived."*

Now this is pretty interesting. Marie Fehmer's notes relate that *"Judge Hughes called in at 2:02--said she could get to the plane in ten minutes."* They do not specify that Judge Hughes called President Johnson. Judge Hughes was interviewed by KRLD's Eddie Barker shortly after the swearing-in, and wrote a first-person account of the swearing-in ceremony for the Washington Post that evening. At neither time did she mention talking to Johnson. She gave the Johnson Library an oral history on 10-7-68. There, she repeated the same story. After hearing of the shooting, she left the Trade Mart where Kennedy was scheduled to speak. She went home to Highland Park. Upon reaching home she called into her office, and was told Johnson was looking for her. She told U.S. Attorney Barefoot Sanders, who had come into her office after being asked to track her down by someone on the plane with Johnson, presumably Marie Fehmer, she would leave for Love Field immediately, and be there in 10 minutes. She did not change clothes. She drove straight there. Sanders, in his own oral history, however, relates that after asking Hughes *"to get on out there,"* he *"told them."* It seems clear, then, that Sanders, not Hughes, told Fehmer she'd be there in 10 minutes. Yes, it appears that Johnson, or his ghost-writers, or both--perhaps misunderstanding Fehmer's notes--came to believe he'd actually spoken to Judge Hughes prior to her arrival, and invented a conversation in which he offered her his help, etc. It was a President's account of the first moments of his presidency. And it was pure fiction.

Johnson then described the approach of a small plane to Love Field, and of its pilot's seeking permission to pull up alongside Air Force One and unload its very important passenger, his young

associate Bill Moyers. He then claimed: *"a few minutes later, Bill joined us aboard the plane."* Note that by adding these *"few minutes"* in between his call with Hughes and Mrs. Kennedy's arrival, Johnson had created the illusion he'd spoken to Hughes minutes before Mrs. Kennedy's arrival.

He then described Mrs. Kennedy's arrival. Here, he unveiled yet another shift. While he'd told the Warren Commission *"I estimate that Mrs. Kennedy and the coffin arrived about a half hour after we entered the plane, just after 2 o'clock"* he now declared *"About 2:15 the moment arrived against which I had been steeling myself--and dreading to the depths of my being. Mrs. Kennedy was coming aboard with the President's body."* Apparently, someone close to Johnson had pointed out to him that the Secret Service reports written a week or so after the assassination were more helpful to his cause than the notes of his secretary written on the plane, and used as the source material for his statement to the Warren Commission.

Johnson then proceeded: *"Lady Bird and I went to the rear of the plane to meet her. I had not seen Mrs. Kennedy since morning, when we had gotten into our cars at the airport to begin the motorcade."* Hmmm... That's interesting. Both Mrs. Kennedy and Marie Fehmer insisted he'd seen her just a minute or two before, when Mrs. Kennedy found him in her bedroom... It seems likely, then, that Johnson was lying on this point as well.

There's also this. While Sid Davis', Merriman Smith's and Charles Roberts' published accounts of Johnson's swearing-in fail to note the arrival of Judge Hughes, and suggest they'd arrived just after she'd reached the plane, Johnson now claimed *"We were still waiting for Judge Hughes when the press pool entered."* If true, this suggests they'd deliberately left her arrival out of their reports, and had thereby misled their readers into thinking Jackie Kennedy had held up Johnson's departure from Dallas, as opposed to the reverse.

There's another possibility, of course. Seeing as no other account places the arrival of the reporters before the arrival of Judge Hughes, Johnson's sudden insistence that this was so years after the fact suggests that perhaps, just perhaps, Johnson's swearing-in and Mrs. Kennedy's departure from Dallas were delayed not only by their waiting for the arrival of Mrs. Hughes, but by their waiting for the subsequent arrival of the press corps Johnson desired as witnesses to his assuming office.

There's still another possibility. Charles Roberts was interviewed as part of the Johnson Library Oral History program on 1-14-70. He claimed the press pool arrived before Judge Hughes, but stayed outside the plane so Merriman Smith could make use of a nearby pay phone. He then offered: *"I think he was in the booth as Judge Hughes arrived. She was sort of whisked up the ramp, then Kilduff took us up into the plane right behind her."* Perhaps, then, Johnson thought the press pool had arrived after Mrs. Hughes, and was worried this could be used to suggest he'd held up Mrs. Kennedy's departure, not just to take the oath, but to have the press corps present while he took the oath... And had then decided to lie about it...

Or perhaps he was simply mistaken on this point. If Johnson were the biggest liar in the world, he would still be bound to make an honest mistake from time to time. Perhaps this was one of those times.

In any event, Johnson's book was not the last word. In **1972**, O'Donnell published a biography of Kennedy, *Johnny, We Hardly Knew Ye*. Here, he addressed the different stories and tried to make sense of them. He pulled no punches. He called Johnson a liar.

On pages 31 and 32, he insisted that, after Kennedy was pronounced dead: *"I figured that Johnson,*

who had flown to Texas separately from the Kennedys on Air Force Two, the second 707 jet plane in our party, which was identical to Air Force One, would be taking off for Washington immediately. We did not know then whether or not President Kennedy's assassination was part of a planned conspiracy that might also threaten Johnson, and, in any case, it seemed imperative to get the new President out of Dallas right away. I knew, however, that Jackie would not leave Dallas until she could bring her husband's body with her. This would take at least a little time, so I assumed that Johnson would be leaving for Washington ahead of us. This presented no problem; with the two planes waiting in nearby Love Field, he could take one and leave the other one for us. If Johnson wanted to use Air Force One, as more fitting to his new office as President, that would be all right with Jackie and with us. Both planes had the same equipment and facilities. The only difference between Air Force One and Air Force Two was the identification numbers on their tails. I went to Johnson to urge him to go to Washington immediately and to explain to him that I wanted to remain in the hospital with Jackie until President Kennedy's body was ready to be moved to the airport... 'You'd better get the hell out of here,' I said, 'and get back to Washington right away... Get the police to seal off Love Field, and go there right now,' I said. 'And take off for Washington as soon as you get there.' Johnson agreed that I should stay behind at the hospital until Mrs. Kennedy was able to leave with the President's body. 'You take good care of that fine lady,' he said. He never suggested that he might wait at the airport for Jackie and the body of President Kennedy before he left for Washington. If he had made such a suggestion, I would have vetoed it... He never discussed with me whether he should use Air Force One instead of Air Force Two, a question which would have seemed highly unimportant at the time."

O'Donnell then related an incident at Parkland Hospital, where the local coroner Earl Rose refused to release President Kennedy's body to the Secret Service and Mrs. Kennedy, and where they up and took it anyway. By page 37, O'Donnell, along with Mrs. Kennedy and the body of President Kennedy, finally reached Air Force One, where Mrs. Kennedy found Johnson in the bedroom. O'Donnell then pushed Johnson to have the plane take off immediately, only to be rebuked. According to O'Donnell, Johnson told him *"We can't leave here until I take the oath of office... I just talked on the phone with Bobby. He told me to wait here until Sarah Hughes gives me the oath..."* O'Donnell then claimed: *"I was flabbergasted. I could not imagine Bobby telling him to stay in Dallas until he had taken the Presidential oath... Taking the oath is just a symbolic formality and there is no need to hurry about it. Johnson could have waited until he got to Washington and spared all of us on Air Force One that day, especially Jackie, a lot of discomfort and anxiety."* O'Donnell then added: *"Later that night, Bobby gave me an entirely different version of his conversation with Johnson about taking the oath. He said Johnson had telephoned him... to express his sympathy, and then said to Bobby that 'a lot of people down here had advised him to be sworn in right away,' and asked if Bobby had any objection. 'I was too surprised to say anything,' Bobby said... 'Then he began to ask a lot of questions about who should swear him in. I was too confused and upset to talk to him about it, so I switched him over to Nick Katzenbach..."*

O'Donnell then dismissed reports of the flight back from Dallas as one in which open hostility was displayed between the Kennedy and Johnson camps, but nevertheless acknowledged *"Some of us did feel that he was using Mrs. Kennedy and the Kennedy aura when he moved into her husband's Presidential plane so he could stage his oath-taking ceremony there with her present, and so he could arrive in Washington with her and President Kennedy's casket. I think Johnson sensed that he might be criticized for taking over Air Force One instead of going back to Washington earlier on his own plane, as we assumed he would do. This must have been why he later made a big point of insisting in his testimony before the Warren Commission, and in interviews with reporters, that I had specifically told him to take Air Force One when we talked before he left Parkland Hospital. He was trying to shift the blame for his being on Air Force One to me, just as he insisted that he waited in Dallas to take the oath on the plane because Bobby Kennedy had told him to do so, which was not true at all."*

Hmmm... Johnson and O'Donnell were hopelessly at odds. Who was telling the truth?

Let's check back in with Rufus Youngblood. In his **1973** book *20 Years in the Secret Service*, Youngblood offered up a slightly different version of O'Donnell's comments at Parkland. Here is what he ultimately wrote regarding Johnson's decision to wait for Mrs. Kennedy on the plane: *"Sir, we must leave here immediately!" I said to Johnson. The President's life was no longer in the balance. The reason for staying at the hospital no longer existed. 'I can't leave without Mrs. Kennedy,' Johnson replied. O'Donnell said, 'She won't leave without the body. A casket has been ordered but it isn't here yet.' 'We can wait for her on the plane,' I said. O'Donnell agreed that Johnson should go to Air Force One at once. Months later, amid all the sniping and second-guessing, Johnson was criticized for 'usurping' the Presidential aircraft. What these critics chose to ignore was the simple fact that Air Force One--or to more correctly identify the plane in question, Number 26000--had superior communications capabilities that were absolutely essential in the uncertain conditions that prevailed at the time. Lyndon Johnson was President, even though the formality of the swearing-in had not yet taken place. As President, his duty to the country was to take every possible measure to insure the safety of the nation. In Dallas, Air Force One was an extension of the White House, and as Johnson said himself, he saw nothing strange about the President using the President's plane."*

Well, this is most interesting. While Youngblood had previously claimed it was O'Donnell's idea Johnson take Air Force One, he now offered Johnson's rationale for taking the plane--that it had superior communications and was the President's plane--and said only that O'Donnell "agreed" Johnson should take Air Force One. He mentioned nothing of his being sent down the hall to get this agreement--the story, we can only assume, either Johnson told Bishop, or Bishop came up with on his own, while confusing Roberts for Youngblood. He said nothing, moreover, of O'Donnell's agreeing that Johnson would wait for Mrs. Kennedy on the plane. In doing so, for that matter, Youngblood had put his Warren Commission testimony into context. When he'd testified *"he agreed that we would go on to the airplane and board the plane and wait until Mrs. Kennedy and the body would come out"* he was talking about Johnson, and Johnson's agreeing with his (Youngblood's) suggestion they wait at the airport.

Conclusion number 12: Kenneth O'Donnell never told Johnson to take Air Force One. (He agreed that Johnson should leave immediately, without realizing Roberts, Youngblood, and Johnson took this to mean he should leave on Air Force One immediately.)

Conclusion number 13: Kenneth O'Donnell was never told Johnson would be waiting for Mrs. Kennedy on Air Force One.

In opposition to Johnson's statement to the Warren Commission, then, it seems quite clear that O'Donnell never actually *"said that we should return to Washington and that we should take the President's plane for this purpose"* or *"urged again that we go ahead and and take Air Force 1 and return to Washington."* O'Donnell had at best only agreed to such a thing, and did not know Johnson would be on Air Force One when he arrived with Mrs. Kennedy. President Johnson had misled his own Commission...charged with discovering the truth about the assassination of his predecessor, and he'd done so, apparently, for political reasons.

He'd orchestrated the return flight from Dallas so that Mrs. Kennedy would have no alternative but to fly home on his plane. He then lied about it. If Bobby Kennedy hadn't charged onto the plane on its arrival back in Washington, for that matter, Johnson would almost certainly have forced Mrs. Kennedy to exit the plane on his arm.

He was afraid folks might think he'd killed his predecessor, and sought to hide behind the widow's

skirts.

Conclusion number 14: President Johnson lied in his statement to the Warren Commission when he suggested it was Kenneth O'Donnell's idea he leave on Kennedy's plane.

Still, it's hard to see this clearly. And here are a few of the reasons why...

In **1980**, Merle Miller published *Lyndon: An Oral Biography*, a book in which Johnson's story was told by numerous witnesses, including Johnson himself. In writing this, Miller used only direct quotes, from previously published materials, oral histories performed for the Johnson Library, and interviews performed by Miller specifically for his book. When describing what happened on the plane, however, Miller made a surprising choice. He picked someone who wasn't even there: Johnson assistant Walter Jenkins. He quotes Jenkins as follows: *"I began to get calls from President Johnson who was on the plane which was sitting on the ground in Dallas. The first question was whether he should be sworn in right away. He asked me to get hold of Bobby Kennedy and ask him, which I did. He was for the swearing in. He said that there is no question but that he is president, but we don't know but that this is an international conspiracy and maybe there are others that are going to be attacked, and that he should be sworn in as quickly as possible. And then he talked to Mr. Johnson and reiterated what he had said to me."*

Well, that's mighty interesting. Johnson mentioned calling Jenkins, but said this had happened after he'd called Bobby, and that Bobby's return call had come in the middle of this call. Neither Johnson nor Kennedy had ever mentioned Jenkins' first calling Bobby, and Bobby's telling Jenkins Johnson should be sworn in at once. Jenkins was reportedly loyal to a fault. Was he lying to help support Johnson's claim Bobby was for the swearing in?

It appears so. The rest of Miller's quote of Jenkins is also interesting. Jenkins continued *"Then there was the question of the oath. Johnson wanted me to find Sarah Hughes, which I did. I knew her closest friend was Irving Goldberg, so I called him, and he was able to locate her and get her to the plane. He said: 'She may not know the oath for the President of the United States.' So we had to get a copy and read it to them. Somebody dug it out from the White House archives and it was given over the phone to Jack Valenti, who wrote it down on an invoice and gave it to Judge Hughes."*

Well, here, Jenkins was taking credit for the actions of Sanders, who claimed he'd tracked down Hughes, and Kennedy, who admitted asking Katzenbach to find the oath. Tellingly, he also claimed he'd talked to Goldberg, when Goldberg specified that he'd spoken, first, to an operator, and then Johnson. And Johnson admitted calling him. Jenkins had thereby showed his stripes. He was unreliable and tended to make claims that cast both himself and Johnson in a favorable light.

But here's the kicker: we can't say any of this for sure because Miller was also unreliable. Miller failed to cite the source of his quote of Jenkins. In the sources section of his book, he cited both a personal interview of Jenkins, and Jenkins' oral histories with the Johnson Library. He did not provide dates for these interviews. While the University of Virginia has placed over a thousand of the oral histories performed for the Johnson Library online, moreover, none of the at least three oral histories performed by Jenkins are among them. And Miller's papers regarding his book on Johnson? Well, they are also held by the Johnson Library...and also unavailable to the public at large.

And it's not as if we can just trust Miller on this... Miller's reputation was built on his book *Plain Speaking*. This book was built on his taped interviews with President Harry S. Truman. These tapes are now held at the Truman Library. There was a problem with this book, however. This problem was discovered by historian Robert Farrell long after Miller's death in 1986. This problem was not a small problem, moreover. It's actually kind of a big one. You see, some of the quotes attributed to Truman in Miller's book were never uttered by Truman in his taped interviews. Apparently, he'd just made them

up.

So that is why I call this all a Rorschach blot. The patterns we see among all these statements and contradictions may say more about us than about the creators of these patterns.

As for me, I see Jenkins, and Johnson, as liars. Miller's book on Truman--in which he apparently invented some quotes--was published years after Truman's death. His book on Johnson, on the other hand, was published in 1980, while Jenkins was still alive, and but 62 years of age. If Miller had made up the quote he'd attributed to Jenkins, he was taking a heckuva risk Jenkins would find out about it, and denounce his book. It follows, then, that Johnson's close associate Jenkins almost certainly lied to protect Johnson against the charge he'd lied about Bobby. And that Johnson had probably lied as well...

And that they'd largely gotten away with it... Yes, for many years after Johnson's ever-changing story on the why's and how's of how he ended up on Kennedy's plane taking the oath of office with Kennedy's widow by his side should have been brought to light, most of those writing on the events of the plane either presented them as a he said/she said situation or, unbelievably, took Johnson's side.

Here's a good, er, bad example. In 1985 former Secret Service Agent Dennis McCarthy published *Protecting the President*, a best-selling account of his years as an agent, sprinkled with a bit of history. His discussion of the flight back from Dallas was bizarre, to say the least. He wrote: *"Some of Kennedy's staff later criticized Johnson's use of Air Force One immediately after Kennedy's death. Perhaps one can understand their feelings, but from a security standpoint it would have been utterly ridiculous for the new President to have returned to Washington on older, propeller-driven Air Force Two, while Air Force One, with its superior communications equipment, was used as a hearse for the dead president."*

Well, where do we begin? First, the bit about Air Force Two being prop-driven... Absolute horse-pucky. It was a jet, a Boeing 707 nearly identical to Kennedy's plane. It had, in fact, BEEN Kennedy's plane, and Eisenhower's plane before that. Yes, Johnson's plane on the morning of 11-22-63--the one upon which he refused to fly back to Washington--tail number 86970--had been Kennedy's plane as recently as August 1962. And it wasn't retired because it was out of date. It was, in fact, in perfect condition, and would remain so for decades to come, remaining in the presidential fleet until June of 1996. Over that stretch, moreover, it would be used in a number of famous flights. In 1981, ironically, it served as Air Force Two for Vice-President George Bush when he flew back to Washington after President Reagan was shot. In 1967, even more surprisingly, it was pressed into service as Air Force One when Johnson flew around the world.

In 2008, the pilot on this flight, James Cross, wrote a book on this experience, entitled, appropriately enough, *Around the World with LBJ*. Cross reported that Kennedy's former plane, tail number 26000, was being overhauled in December 1967, and that during this time Johnson decided to fly to Australia, and then continue on around the world. He reported that Johnson was at first upset he couldn't take 26000, which he called the *"big plane"* due to its being all of 7 feet longer than the back up planes, including 86970, and its having a 15 foot wider wingspan. He quoted Johnson as insisting *"No, I don't like those planes...They don't have good sound-proofing and I don't like the seats, and they don't have a bed in them like I'm used to."* Cross reported that Johnson soon realized he couldn't get his way, and agreed to fly on 86970--which Cross said he personally preferred, due to its having *"more powerful engines"* than 26000--under the condition it be refurbished to his liking before the trip. According to Cross, Johnson insisted *"Well, you better fix it up so it'll have a nice quiet bedroom, a place where I can sleep. Put some of your men on that airplane and fix all the windows so no outside light will leak in. Put a lot more sound-proofing in the walls and fix a projector in that thing and bring some good movies, and put one of my good beds in it because I need to rest. And don't forget to put on plenty of food and Diet Fresca."*

So, there it is. At least probably. Johnson preferred Kennedy's plane on 11-22-63 because he found it more comfortable, and more befitting a President, than his plane. His decision to fly to Washington on Kennedy's plane had had nothing to do with National Security. In fact, when given the choice on 11-22-63, he'd chosen to take the plane with a bed, and to forgo the one with the more powerful engines.

And, should one think Johnson above such pettiness, one should consider an anecdote found in, of all places, *Protecting the President* by Dennis McCarthy. McCarthy noted that Johnson, while President, liked to go speed boating on a lake near his ranch. He noted that the Secret Service, in its proper role as Johnson's bodyguards, bought and maintained two boats fast enough to keep up with Johnson's boat (which in fact belonged to the Coast Guard) and one boat which could run rings around it. There was a problem, however. They were convinced Johnson would requisition this last boat for himself if he realized how fast it was, and leave them without a boat with which to adequately protect the Presidency. And so they decided to pretend this boat was slower than Johnson's, and let him win race after race, year after year...

Let's recall here what Mrs. Kennedy told Schlesinger, back in 1964: *"I don't know if Lyndon had an Air Force One just like it or one of the older planes, but he always kept pushing for a bigger plane. And--or for more--all the kind of things like that he wanted, the panoply that goes with power, but none of the responsibility."*

The Rorschach Blot As Seen By Vincent Bugliosi

Still, some would like us to think Johnson's behavior on the day of the shooting was just peachy. In *Reclaiming History*, his mammoth book on the assassination, published 2007, Vincent Bugliosi notes that O'Donnell denied telling Johnson to fly back on Air Force One, but nevertheless dismisses O'Donnell's position. He *"wonders"* if O'Donnell had found it *"convenient to deny"* telling Johnson to take the plane, and argues, furthermore, that we should take Johnson's side in his disputes with *"Kennedy loyalists"* over his behavior on day one of his presidency, because *"the weight of the evidence is that LBJ was very sensitive to the feelings of the entire Kennedy camp following the assassination."*

Well, first of all, that's nonsense... If Johnson was so concerned about Mrs. Kennedy's feelings in the immediate aftermath of the shooting, why the heck didn't he ask her what SHE wanted to do--whether SHE wanted to return to Washington with her husband's body on her own plane... whether SHE wanted to leave as soon as she arrived on Air Force One... or whether SHE was willing to delay her departure until after Johnson had been sworn in?

It seems clear, moreover, that Bugliosi's failure to read (or remember) the full body of evidence on these matters had grossly misrepresented *"the weight of the evidence."* While accepting O'Donnell's position he thought Johnson would be flying back immediately upon arrival at the airport, and was surprised to find Johnson at the airport when he arrived, for example, he cites a 6-28-05 interview with Secret Service Agent Lem Johns. He fails to note that Johns, in his 11-29-63 report, had previously claimed: *"To the best of my knowledge I believe that the Vice President learned from Mr. O'Donnell that Mrs. Kennedy was getting a casket, and would proceed as soon as she could to AF-I for return to Washington, D.C., with President Johnson on the same plane."* If he'd really been on top of it, Bugliosi would have pointed out the contradiction, and concluded either that Johns' latter day recollection was in error, or that Johns' original report was strangely worded and unreliable. But, alas, he did neither.

This pattern of avoiding the uncomfortable extends through Bugliosi's narrative at other points as well. He asserts that in their second phone call Robert Kennedy told *"Johnson that the oath should be administered immediately, before taking off for Washington."* He cites for this assertion not only

Johnson's statement to the Warren Commission, but William Manchester's *The Death of a President*, and Arthur Schlesinger's *Robert Kennedy and His Times*. He fails to note that two of his three sources are at odds with his conclusion--that Manchester's book relates that both Robert Kennedy and Ed Guthman, who claimed to have been a witness, disputed Johnson's claim, and that Schlesinger's book similarly quotes Kennedy. Bugliosi fails to note, moreover, that Johnson's 1966 phone call to Moyers (which was published three years prior to Bugliosi's book) proves that by December 1966 Johnson himself no longer believed Kennedy had told him he should be sworn in.

He misleads his readers in the process. While he tells his readers Mrs. Kennedy found Johnson in her bedroom when she finally reached Air Force One, he notes as well that this is her version of the story, and that Johnson's version of events suggested otherwise. He even cites Lady Bird's statements as support for Johnson's story. Incredibly, he never mentions that Marie Fehmer had told both William Manchester and the Johnson Library that Mrs. Kennedy was telling the truth, and that this proved Johnson to have been deceptive, at the very least, on this matter.

So, let's do a quick replay. Bugliosi 1) led his readers to believe O'Donnell had been lying, and that Johnson had been telling the truth, when the evidence for this was unclear; 2) failed to even acknowledge that Johnson may have been lying about his conversation with Robert Kennedy; and 3) pretended that Mrs. Kennedy and Johnson had had an honest difference of opinion, when the evidence was crystal clear that Johnson had been lying.

It's even worse than that. In his discussion of the Johnson/O'Donnell divide, Bugliosi cites the testimony of Rufus Youngblood as support for Johnson's claim O'Donnell told him to take the plane. He relates that Youngblood said O'Donnell had done this because it had *"better communications equipment."* He then cites as supporting evidence the 1966 U.S. News and World Report article in which an unnamed former White House employee claimed that Air Force One had better communications than Air Force Two for a brief period in 1963, including on the day of the assassination. He failed to note that three NAMED former White House employees--O'Donnell, O'Brien, and McHugh--had claimed the communications equipment on the two planes were identical. And not only that, he failed to note that by 1966 Johnson and his supporters had long since stopped claiming O'Donnell had said the communications were better on Air Force One, and had shifted to claiming the Secret Service had told Johnson as much...

Reclaiming History... I don't think so... More like muddying the waters...

The Rorschach Blot As Seen By Steve Gillon

Steve Gillon, the History Channel's resident historian, and the author of *The Kennedy Assassination, 24 Hours After*, published 2009, is nearly as hard on Johnson as I. He spots many of the contradictions in Johnson's statements, and sees Johnson's lack of honesty regarding what took place on the plane as a major factor in his subsequent rift with the Kennedy's, his loss of credibility with the public, and ultimate downfall.

He concludes: *"LBJ's fear that the nation would not accept him as the legitimate heir to the presidency convinced him that he needed someone close to the slain president, either Kenneth O'Donnell or RFK, to endorse every decision he made on that fateful day. He proved himself willing to manipulate both men in order to obtain the political cover he desired--or he simply lied and manufactured their compliance. He claimed that O'Donnell specifically ordered him to board Air Force One, when that decision was most likely made by the Secret Service. He insisted that O'Donnell was the first person to tell him that JFK was dead, when the evidence shows that Emory Roberts delivered the news. Later, he manipulated a grieving RFK into agreeing that he should take the oath in Dallas. After getting RFK to*

endorse his decision to take the oath in Dallas, he told everyone on the plane that the swearing-in was the attorney general's idea. The pattern of deception so evident in the early hours of LBJ's administration would eventually erode the moral authority of his presidency. Johnson's penchant for bending the facts to suit his purposes raised doubts about his integrity and created a credibility gap that eventually undermined public trust in his administration...Johnson told so many small lies, and some big ones, that many people started to question everything he said."

And yet Gillon was far too charitable... As Gillon accepted John McCone's claim RFK had agreed to Johnson's being sworn in on the plane, and failed to note that Ed Guthman had told William Manchester the opposite was true, it seems likely he had a built-in bias to trust Johnson's claims--as long as he had a witness. He fails to accept that some of these witnesses could have been lying. His willingness to provide Johnson--a man he concludes was an habitual liar--the benefit of the doubt, moreover, also seems apparent. I mean, why else provide Johnson an alibi for his systematic lies--that he was afraid he would not be accepted? Johnson himself never offered such an alibi. And we shouldn't believe him if he did.

Yes, as hard as he was on Johnson, Gillon was still far too defensive of the man. In an 11-20-10 blog on the Huffington Post, he claimed *"Kennedy loyalists viewed Johnson's decision to fly Air Force One back to Washington as part of the larger narrative of the day -- an example of LBJ's insensitivity and his megalomania. They would later claim that LBJ was so desperate to surround himself with the trappings of presidential power that he hijacked the Kennedy plane. The charge is bogus. Johnson never requested to use the Kennedy plane. The secret service made that call for him. (LBJ and JFK flew to Dallas on separate but identical planes. The Kennedy plane was designated Air Force 26000. Any plane carrying the president is automatically designated Air Force One, so in that sense it did not matter which plane Johnson chose.) But it did matter to the secret service. Agent Emory Roberts never questioned that LBJ would be returning to Washington on Air Force 26000. In his mind, Air Force 26000 was the president's plane. Kennedy was dead and Lyndon Johnson was now president. It was now his plane. It may have been unsentimental, but it was appropriate. And Roberts never asked Johnson what plane he wanted to use."*

When one reads through Gillon's book, moreover, one finds the source for his contention the decision to fly back on Air Force One had been made by Roberts. It was Roberts himself, in his 12-4-64 interview with William Manchester. Here is how the book discusses the matter: *"Roberts, typically, was unsentimental about the issue of which airplane to take. When Manchester asked Roberts why the sense of 'urgency' to take Air Force One when the Johnson plane was available, Roberts said, 'Yes, we knew there were two planes there but I was thinking only of the presidential plane...I was thinking only of Air Force One.'"*

Should you fail to be blown away by this, well, join the club. Gillon's position on this issue is almost as nonsensical as Bugliosi's position on, well, many issues. The plane on which the President flies is Air Force One. Period. If Johnson flew back to Washington on the plane formally called Air Force Two, it would have been Air Force One. Period. Roberts' Secret Service report reflects that Johnson sent him down the hall to get O'Donnell's permission to fly back on Air Force One. Even if O'Donnell told Roberts "Yes" and didn't just nod his head, as later claimed by Manchester, and even if he fully understood that by Air Force One Roberts meant Kennedy's plane, it follows from this that Johnson was not forced to fly back on Kennedy's plane by Roberts. It was Johnson's decision. He may have been influenced by Roberts when making this decision. He may have thought O'Donnell had agreed to this decision. But it was his decision. Not O'Donnell's. Not Roberts'. Period.

I mean, this couldn't be any clearer. Roberts suggested they fly back on Kennedy's plane, and Johnson made the decision that they do so. Johnson could have flown back on the plane that flew him out there--the plane that still held his luggage. No one told him he could not. In fact, it seems obvious from

reading the statements of Roberts and Youngblood that they would much rather have had Johnson leave immediately on that plane--even if it was in some way inferior to Kennedy's plane--than sit around for an hour in Kennedy's plane.

This circles back to another point--one unexamined By Gillon. In 1964 Johnson and his defenders were putting the word out that Kenneth O'Donnell had told Johnson to fly back on Air Force One, due to its superior communications equipment. This was disputed by O'Donnell in his testimony before the Warren Commission. This dispute was discussed in William Manchester's book, *The Death of a President*. In late 1966 and early 1967, then, Johnson's defenders started claiming the Secret Service had told Johnson to fly back on Air Force One, due to its superior communications equipment. What they failed to realize, however, was that the agent in charge of Johnson's detail when it raced off for the airport, Emory Roberts, was interviewed in 1964, and asked why they'd raced back to Kennedy's plane...and had responded in a manner suggesting the decision had had NOTHING to do with the plane's communications equipment, and everything to do with Roberts', and apparently Johnson's, perception that the plane represented something more than just a means of transportation, and was, in fact, something akin to a throne. The dead king no longer sits upon the throne. It was the new king's to sit upon, so sit upon it he must.

The real weight of the evidence, then, is that Johnson and his defenders had told a series of lies designed to conceal that Johnson had made the decision to wait around in Dallas, and that he had done so against the wishes of the Secret Service, and that he had done so without any input from Mrs. Kennedy. It's clear, moreover, that he didn't really care what Mrs. Kennedy wanted on November 22, 1963--and that she was, in fact, a hostage to his political orchestrations. He had, after all, moved into the plane in which she was accustomed to traveling and made it clear that she was flying back with him...NO MATTER what she wanted...

This fact, however, has proved too hard for many to digest.

The Rorschach Blot As Seen By Robert Caro

Johnson's Pulitzer Prize-winning biographer Robert Caro is clearly among the fact-shy. In his massive and supposedly immaculately-researched work *The Passage of Power*, published 2011, he makes a number of mistakes. Most are errors of omission. While he acknowledges Johnson's and Kennedy's accounts of their phone calls differ, for example, he writes *"The only witnesses to the calls--Rufus Youngblood and Marie Fehmer--heard only one side of them."* He fails to acknowledge that Manchester interviewed Guthman, and that Guthman was reported to have claimed he'd heard Kennedy's side of the call, and that Kennedy hadn't told Johnson he should be sworn in in Dallas, as later claimed by Johnson. He fails to mention even that McCone had also claimed to hear Kennedy's side of the call, and to have told Manchester the opposite--that Kennedy had in fact told Johnson he should be sworn in. More pointedly, however, Caro fails to cite Johnson's 1966 call to Bill Moyers, in which he as much as admitted Kennedy hadn't told him he should be sworn in in Dallas. While Caro does cite Marie Fehmer's Oral History, in which she admitted Johnson was in the bedroom when Mrs. Kennedy came on the plane, for that matter, he fails to note the disturbing fact this ran counter to the narrative pushed in the notes written by Fehmer while still aboard the plane. These may have all been innocent oversights, of course.

But some of Caro's mistakes are not so easily dismissed. Caro relates that, after O'Donnell told Johnson he should leave the hospital immediately, and that Mrs. Kennedy would not leave Dallas without her husband's body, *"Johnson said in that case he would leave the hospital but not Dallas; he would go to the plane, but he would wait aboard it for the coffin, and the widow, to arrive. A contrary course continued to be urged. A new adjective entered the descriptions of Lyndon Johnson. He was,*

Youngblood says 'adamant.'" A look at Caro's end notes, furthermore, shows that he got this last quote from page 117 of Rufus Youngblood's 1973 book *20 Years in the Secret Service*.

The problem is that Caro--as respected an historian as ever graced the best-seller lists--was blowing smoke. The sentence from which Caro cherry-picked his line about Johnson being "adamant" reads as follows: *"He remained adamant about staying put until there was some definitive word on the President."* That's right. Caro had taken Youngblood's description of Johnson's demeanor before the President's death had been announced, and had used it to shore up Johnson's position that he'd told O'Donnell he would wait for Mrs. Kennedy on the plane.

The evidence suggests, moreover, that Caro's mistake was not entirely innocent. In Caro's 5 volume biography, Johnson is very much an anti-hero, a flawed politician who rose to greatness when his predecessor was unexpectedly murdered. It is important to Caro's thesis, then, that Johnson's first actions as President be noble ones. It seems likely, then, that Caro's overwhelming belief in his thesis had led him to crawl around some mighty inconvenient facts.

Caro's anti-hero president was not heroic, at least not at the outset of his presidency. He'd manipulated people and events so he could fly back to Washington with his predecessor's widow at his side...

But perhaps even this was just an afterthought... Perhaps Johnson's primary interest lay elsewhere...

Valenti and "The Body"

In his 1975 defense of Johnson, *A Very Human President*, former Johnson aide Jack Valenti offered up a fascinating insight into Johnson's actions on 11-22-63. Valenti sat with Johnson on the plane while waiting for Mrs. Kennedy, and was intimately aware of Johnson's thoughts during this period. He wrote of Johnson's decision to be sworn into office as soon as possible--which, while unnecessary, was nevertheless politically desirable. He then added *"before Air Force One departed for Washington, Johnson had also made his first command decision, on his own, to wait for the body of the dead president to be brought aboard before he gave an order to be airborne. This was an intuitive decision and a good one."* So... Johnson, a man famous for seeking advice, had decided not to leave without the body, and had come to this decision entirely on his own, after reaching Air Force One. Hmmm...

And this wasn't a one-time misstatement. In a 1978 WBBM interview with Bob Wallace (found on youtube), Valenti repeated and expanded upon this claim. He said that, after reaching Air Force One, *"Johnson made two decisions: one, that he would not leave without the body of President Kennedy aboard. And second, as an act of symbolism--he didn't need to--he was gonna be sworn in on that airplane. And so we waited for some minutes until the body of the slain president could be brought aboard. He was not about to return to Washington without the body...There was some confusion about the local coroner, the red tape. But Johnson was adamant that he was not leaving until the dead president's body was aboard."*

In a demonstration of both Valenti's certainty on this point, and his confusion regarding others, moreover, he told the Kennedy Library, in an oral history performed 5-25-82, that while he observed little tension between Johnson and the Kennedy faction on the plane back from Dallas, he did see General Godfrey McHugh *"running rather hysterically up and down the airplane. Trying to take charge."* He then offered *"The new president gave orders that he was going to wait for the body of the late president, of which McHugh was furious about."* Valenti had forgotten, one can only assume, that McHugh had arrived with the body of the late President, and was trying to get the plane airborne, unaware that Johnson was on the plane, refusing to let it take off until he'd been sworn-in.

And that wasn't the last time Valenti made this mistake about McHugh. An article by Valenti published in the 11-22-88 Washington Post related that, upon his arrival at the plane: *"Gen. Godfrey McHugh, President Kennedy's Air Force aide, now seemingly in command of the presidential plane, had ordered it into the air. He did not know that LBJ had already communicated to the pilot that Air Force One was not to depart until President Kennedy's body had been brought aboard."* The body, not the widow.

By the time of his 7-15-91 interview with Deborah Hart Strober and Gerald S. Strober, thankfully, Valenti stopped making this error. He did, however, continue making his other claim: that Johnson was waiting for Kennedy's body, and not Mrs. Kennedy. He said that on the plane *"Johnson made two command decisions that, in retrospect, were so right. one was that he wasn't going to leave without the coffin of the thirty-fifth president; number two, he wanted to be sworn in so that the picture of that swearing-in would be flashed around the world..."*

In an 11-21-93 article in the Washington Post, discussing the events of 11-22-63, moreover, Valenti further recalled that, once aboard Air Force One, *"Johnson made two command decisions: First he would be sworn in aboard Air Force One...Second, he would not leave Dallas until the coffin of the 35th president had been brought aboard. Though Bobby Kennedy had counseled otherwise, the new president was firm."*

And that wasn't the last time Valenti claimed Johnson was waiting for Kennedy's body, with no mention of his purportedly all-encompassing concern for Mrs. Kennedy. No, far from it. An 11-22-98 New York Times article by Valenti confirmed that, after installing himself on Air Force One, Johnson's *"first decision was that he would not leave Dallas without the body of President Kennedy on board"* and that *"his second decision was to be sworn in on the plane, before departure."* An 11-20-03 article by Valenti in USA Today similarly claimed: *"On Air Force One, I observed how LBJ, when the dagger was at the nation's belly and his own, made historical decisions quickly and decisively. While the rest of the plane's occupants were in varying states of hysteria, LBJ was supernaturally calm, as if he had brought all his volcanic passions under stern harness. He made, on the spot, two key visionary decisions. First, although he was urged to get in the air immediately for his safety, he said, 'No, I will not leave until the body of President Kennedy is brought aboard.' Second, he was determined to be sworn in as president on the plane, although Justice Department officials insisted he already was president. But Johnson wanted a photograph of his formal ascension to the presidency to be flashed around the globe, to soothe a frightened nation and an equally fearful world."* An 11-22-03 AP article on Valenti by Sharon Theimer then echoed this claim, reporting: *"Johnson made two decisions instantly, Valenti said: He refused to let Air Force One take him back to Washington without Kennedy's body on board, and insisted on taking the oath of office on the plane. A deputy attorney general assured Johnson he already was president, but Johnson took the oath there anyway..."* And, no, that wasn't the last of it, either. In his 2007 memoir *This Time, This Place*, Valenti claimed yet again and for the permanent record that Johnson *"understood intuitively that he could not leave the body of President Kennedy alone in Dallas."*

Well, this is curious, and a bit suspicious to those inclined to suspicion. Why would Johnson refuse to leave Dallas without the President's body--to which he had no right? Valenti's explanation in the Times article that *"LBJ foresaw that he would be maligned for being so eager to be President that he left behind his predecessor's body"* makes little sense in that the alternative--that he would quite correctly be criticized for forcing Kennedy's widow to wait around on the tarmac in Dallas for an additional 30-40 minutes, and then stand by him in her blood-stained clothes during an unnecessary swearing-in ceremony--was something he should also have foreseen, and avoided.

Valenti's latter-day recollections just can't be ignored. There is reason, after all, to believe his latter-day

recollections are in fact not so latter day... Valenti's 1975 book on Johnson, *A Very Human President*, in which he first mentioned Johnson's interest in Kennedy's body, also contains Valenti's notes on a July 25, 1964 background discussion between Johnson and two newsmen, Dan Rather of CBS News and Bob Thompson of the L.A. Times. These notes state: *"Mr. Johnson, in reply to a direct question, said that he had thought an international conspiracy might be underway to 'flatten us out.' Because of this concern, the president said, he ordered that Air Force One be moved at the airport. Then, he said, he decided to go directly to the plane from Parkland Hospital. Even beyond that point, the president said, he had grave doubts about the advisability of 'sitting at the airport' for two hours, but he felt it imperative that President Kennedy's body be returned immediately to Washington."*

No mention of Mrs. Kennedy, or of Johnson's simply acquiescing to her wishes when he flew home with the body of her recently murdered husband. No mention that there was a second jet standing by for Mrs. Kennedy and the body should Johnson have left immediately, as proposed by his advisers. No mention of his determination that she not fly home alone. No, here, according to Valenti's contemporaneous notes of a Johnson background discussion with two newsmen, was Johnson himself claiming that he was waiting for the body--the BODY--because he felt it imperative it be returned to Washington. Right away. With him.

There's also this. In his January 11, 1967 column on the events on the tarmac in Dallas, we should recall, Drew Pearson reported that *"It took about an hour to overcome local red tape and drive Kennedy's body to the waiting airplane."* He then explained: *"Air Force One, the Presidential plane, had been waiting for Kennedy's body. This delay was on the personal order of the new President, and contrary to the wishes of the Secret Service."* And, no, Pearson's reference to the body wasn't a typo, or shorthand for "Mrs Kennedy who was traveling with the body." A few paragraphs later, he repeated that *"Johnson ordered the plane to wait for Kennedy's body."* The BODY...

Pearson's column thereby adds weight to Valenti's subsequent statements suggesting Johnson's preoccupation on 11-22-63 was not with Mrs. Kennedy, but with her husband's body. Even if Valenti was by chance Pearson's sole source for these statements, moreover, it proves Valenti's recollections were fully formed by 1967, and not something that slipped out later.

And there's also this. One of the earliest scholarly books on Johnson was *Sam Johnson's Boy*, by Alfred Steinberg. It was released in July 1968, while Johnson was still President. Although, like Manchester and Bishop, Steinberg failed to cite his sources for particular passages, he did list the names of fifty or so Texas and Washington insiders with whom he consulted in the writing of his book. Jack Valenti was not among them. Even so, Steinberg includes the following description of Johnson's thinking upon arrival on Air Force One: *"Johnson quickly made two decisions. Kennedy's remains would travel to Washington with him so that he would not appear to be in unseemly haste to take charge...Johnson's second decision was that he would be sworn in on the plane before taking off for Washington. Using Kennedy's bedroom phone on the plane, he telephoned Bobby Kennedy at his Virginia home. Although the President's brother was in a state of shock, he took the call. After telling Bobby that his brother's murder 'might be part of a world-wide plot,' Johnson asked whether he should take the oath in Dallas, and, if so, what was the form of the oath? Bobby ignored the first question and said he would call him back on the second."*

Well, this is more than curious, and more than a bit suspicious, wouldn't you say? Why did Johnson think it imperative he gain control of Kennedy's body? Valenti's explanation, which mirrors the explanation offered by Steinberg--that Johnson was scared people would talk if he didn't return with Kennedy's body--seems inadequate. Did Johnson really feel that leaving the body in Dallas would make him look ambitious, or weak, and divide the nation's attention? Upon arrival in Washington, the body was taken to Bethesda Naval Hospital, where an autopsy was performed. The decision to go to

Bethesda was made by Mrs. Kennedy, after speaking to Dr. Burkley, her husband's physician. Burkley had suggested she choose a military hospital. Had Burkley spoken to Johnson as well? Had Johnson told Burkley he wanted the body removed from civilian control as fast as possible?

Hmmm...one can only wonder...

If there's an innocent explanation for this body-snatching, for that matter, why would Johnson later lie about it, and make out that his sole interest was Mrs. Kennedy's welfare, and that the decision to return the body on Air Force One was entirely her own?

Yes, sad to say, something was indeed rotten in Denmark, er... Texas... Texas State law forbade the removal of a murder victim from the state before an autopsy could be conducted. And yet Johnson sat by and nodded his approval while the Presidential detail of the Secret Service--now under his command--violated this law. (While some might find this unfair, as O'Donnell claimed that he was responsible for the removal of the body, and as Dallas Mayor and Johnson crony Earl Cabell claimed he'd intervened at the last minute in order to give the removal of the body the appearance of being "legal," the statements of O'Donnell and the Secret Service agents involved in the removal of the body make clear that they were taking the body no matter what Cabell or others had to say on the matter, and that the Secret Service was ultimately answerable to Johnson, not O'Donnell.)

It is a matter of historical record, then, that among Lyndon Johnson's first acts as President, one of them was to have his subordinates illegally abscond with the corpse of his predecessor. Now, curiously, it is also a matter of historical record that, within moments of Johnson's flying off with the body, the Secret Service flew President Kennedy's blood-stained limousine out of Texas. This meant that both the best evidence (the body) and half of the crime scene (the limousine) were never shown to those with jurisdiction for the crime (the Dallas Coroner and the Dallas Police Department), but were instead illicitly removed from Texas and analyzed in secret by men under Lyndon Johnson's direct control.

Now this alone could have raised doubts about Johnson's involvement in the assassination. And this alone could have caused Johnson to create a commission to clear his name. But there was so much more. The sky upon which Air Force One was flying, metaphorically speaking, was the air of suspicion. Congress had been investigating Johnson for corruption. Within months, he could have been forced to resign. But now, with one quick pull of a trigger, in Johnson's home state, no less, President Kennedy had been killed, and Johnson's hold on power had not only been preserved, but amplified a thousand-fold.

Let's put this in its proper perspective. Lyndon Johnson was a real person, and a real politician, with real ambitions. In 1960, he had run for the Democratic nomination for President against Kennedy, and had unleashed a series of vicious attacks on Kennedy when it looked as though Kennedy was gonna win. (Adlai Stevenson was later to say that these were the most vitriolic attacks on Kennedy he'd ever heard.) As part of his campaign strategy, Johnson had even tried to cast doubt on Kennedy's fitness for office. To do this, Johnson's campaign manager hired private investigators to uncover the truth about Kennedy's health problems. He then began a rumor campaign designed to make people wonder if Kennedy wasn't too sick to serve out his term. (One source, Kenneth O'Donnell, in his 7-23-69 interview for the Johnson Library, put it a little more bluntly. He claimed that LBJ's campaign manager had put out the word that Kennedy *"had Addison's disease and couldn't serve out the term"* and that *"if he was elected he was going to die."*) As the situation grew increasingly desperate in the Johnson camp, moreover, one of his mouthpieces, India Edwards, publicly proclaimed what Johnson had--according to writer Gore Vidal, who'd met with Johnson at the Democratic Convention --been saying in private, namely that *"Kennedy was so sick from Addison's disease that he looked like a spavined hunchback."*

This, no surprise, prompted a response from the Kennedy camp. They issued a series of statements claiming that Kennedy's adrenal dysfunction-- which they'd correctly claimed was not what was classically known as Addison's disease--was in fact under control, with an occasional need for medication. But there's no evidence Johnson believed this. Perhaps then, when Johnson ultimately accepted Kennedy's offer of the Vice-Presidency at the convention, he believed the words of his campaign manager and felt certain Kennedy was on borrowed time. If so, then perhaps, just perhaps, by November 1963 he'd grown tired of waiting for Kennedy to die. These thoughts were undoubtedly on the minds of more than a few...

Particularly as Johnson's campaign manager in 1960, the man who'd conducted an investigation into Kennedy's health problems, and who'd predicted Kennedy's imminent demise, was, in 1963, Kennedy's host on his fatal trip to Dallas, the Governor of Texas, John Connally...

Now, I know some will shy from such speculation. They will say, "But Connally was riding right in front of Kennedy and got shot. He's above suspicion." But let's put this in another time and another place. Let's say it's the year 2003, and John McCain is President. Let's say he got elected in 2000 after reluctantly bringing George Bush onto the ticket. And now he's been killed on a trip with Karl Rove, Bush's former campaign manager. And Karl Rove was wounded in the hail of gunfire. And Rove was heard to yell, as Connally, "My God, THEY'RE going to kill us all!" after getting shot. What would you think? Would you blame anyone who thought maybe, just maybe, Rove was in on the assassination? And that Bush was a party to it as well?

Of course not. These are not innocent times, and Bush and Rove are not innocent men. And neither were Johnson and Connally...

The suspicions of Johnson were REAL and realistic. They were the 800-pound gorilla in the room no one wanted to talk about in 1963, even in hushed tones. On the flight back from Dallas, Evelyn Lincoln, Kennedy's secretary, jotted down a list of those she considered suspects for his murder. This list was not made public until 2010. At the head of a murderer's row of "*KKK, Dixiecrats, Hoffa, John Birch Society, Nixon, Diem, Rightist, CIA in Cuban fiasco, Dictators*" and "*Communists*" was someone Lincoln knew very well, someone sitting right there on the plane with her-- "*Lyndon.*"

Of course, in some circles, little has changed since '63. When, in 2003, forty years after the assassination, the History Channel ran a program on Johnson as part of its multi-part series *The Men Who Killed Kennedy*, it was pressured by prominent historians and political figures to denounce the program, and cancel all future airings of the program. This program was no more inaccurate than other programs in the series, but it forced people to think the unthinkable. And so was made to disappear...

This was unfortunate, as it fostered the perception these historians and politicians had carefully investigated Johnson's actions in the aftermath of Kennedy's assassination, and had found nothing the least bit suspicious. And this clearly wasn't true. Let's recall that in our long and winding discussion of Johnson's behavior in the aftermath of 11-22-63, in Chapter 1 and in this chapter, we have uncovered that Johnson almost certainly 1) lied about his reasons for wanting to fly back on Kennedy's plane; 2) lied about Kenneth O'Donnell's telling him to fly back on Kennedy's plane; 3) lied about telling Kenneth O'Donnell he would wait for Mrs. Kennedy and the body on Kennedy's plane; 4) lied about the first time he saw Mrs. Kennedy on the plane; 5) lied about his being told by Robert Kennedy on 11-22-63 that he should be sworn in on the plane; 6) lied when he indicated he only called Judge Hughes after being told he should be sworn in by Robert Kennedy; 7) lied when he made out that Mrs. Kennedy could have left her husband's body at Parkland Hospital, should she have wished to; and 8) lied when he subsequently claimed the assassination of President Kennedy was thoroughly investigated by Robert Kennedy.

The man was either hiding something, or so scared of how things looked that he lied about them, and made them look far worse...
